1813 *Gazania* Supposed to have been so called from γαζα, riches, in allusion to the splendour of the flowers.

1814. *Cryptostemma* From κρυπτον, concealed, and στεμμα, a crown, the scaly crown of the grains being involved in wool Tender annuals, natives of the Cape of Good Hope

1815. *Arctotheca.* See Arctotis, from which this has been divided

1816 *Sphenogyne* So called from σφην, a wedge, and γυνη, a female, in allusion to the wedge-shaped stigmas. Pretty annual flowers.

1817. *Zoegea* Named after Dr J Zoega, who published a Flora Islandica in 1775. *Leptaurea* is an abbreviation of *Lepto-centaurea*, small centaurea

1818. *Leuzea.* Divided by M Decandolle, from Centaurea, from which it differs in not having the outer florets barren, nor the pappus with simple hair, nor the insertion of the fruit oblique. He named it after his friend Deleuze.

12515 Leaves lanc. entire and sinuated, Stem erect, Flowers stalked

12516 Leaves lanc. spatulate and pinnatifid entire white with down beneath, Pedunc. 1-headed terminal
12517 Stem shrubby decumbent, Leaves spatulate-lanceolate downy beneath, Ray same color as disk
12518 Leaves pinnatifid hairy above downy beneath: segm oval-lanc Scape 1-headed, Stem decumbent
12519 Stem leafy decumbent 1-headed, Leaves subulate linear revolute at edge downy beneath

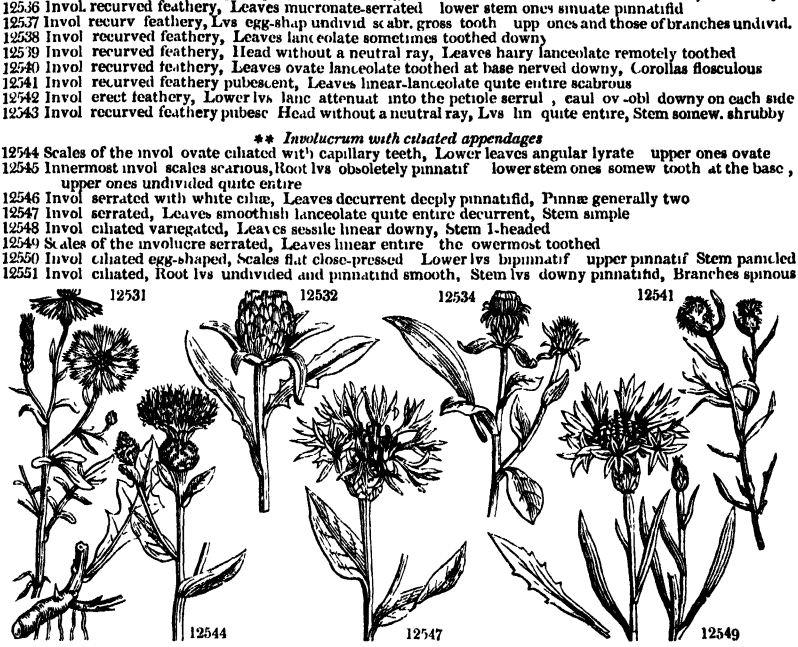
12520 Ligulæ undivided, Leaves pinnatifid toothed downy beneath
12521 Ligulæ 3-5-parted, Leaves lyrate downy
12522 Ligulæ 3-5-parted, Leaves runcinate toothed downy beneath

12523 The only species

12524 Smooth, Lvs bipinnatifid or pinnatifid linear-filiform, Lvs of pappus white
12525 Smooth, Lvs pinnatifid linear filiform, Outer leaflets of involucre subulate
12526 Leaves bipinnatifid or pinnatifid linear filiform smooth, Scales of involucre scarious blunt shining
12527 Leaves bitripinnatifid and involucre downy
12528 Leaves pinnatifid smoothish segm 2-3-toothed, Teeth piliferous, Outer scales of involucre lanceolate
12529 Leaves flat smooth cut pinnatifid at end, Outer lvs of involucre scarious at end, Pappus obsolete
12530 Leaves fleshy linear pinnatifid and bipinnatifid, Pappus much shorter than the florets of disk

12531 The radical and lower cauline leaves pinnatifid

12532 Leaves tomentose root ones lanceolate, stem ones pinnatifid, Stem simple
12533 Flower very large



§ 1 CYANUS. *Involucrum ciliated, unarmed.*

* *Involucrum with feathery setæ*

12534 Inv recurved-feathery, Leaves oblong undivided scabrous mucronate serrulated
12535 Inv recurved-feathery top-shaped, Leaves oblong undivided scabrous mucronate serrulated, Stem simple
12536 Involucrum recurved feathery, Leaves mucronate-serrated lower stem ones sinuate pinnatifid
12537 Involucrum recurv feathery, Lvs egg-shap undivid scabr. gross tooth upp ones and those of branches undivid.
12538 Involucrum recurved feathery, Leaves lanceolate sometimes toothed downy
12539 Involucrum recurved feathery, Head without a neutral ray, Leaves hairy lanceolate remotely toothed
12540 Involucrum recurved feathery, Leaves ovate lanceolate toothed at base nerved downy, Corollas flosculous
12541 Involucrum recurved feathery pubescent, Leaves linear-lanceolate quite entire scabrous
12542 Involucrum erect feathery, Lower lvs lanc attenuat into the petiole serrul, caul ov-obl downy on each side
12543 Involucrum recurved feathery pubesc Head without a neutral ray, Lvs lin quite entire, Stem somew. shrubby

** *Involucrum with ciliated appendages*

12544 Scales of the involucrum ovate ciliated with capillary teeth, Lower leaves angular lyrate upper ones ovate
12545 Innermost involucrum scales scarious, Root lvs obsoletely pinnatif lower stem ones somew tooth at the base, upper ones undivided quite entire
12546 Involucrum serrated with white ciliæ, Leaves decurrent deeply pinnatifid, Pinnæ generally two
12547 Involucrum serrated, Leaves smoothish lanceolate quite entire decurrent, Stem simple
12548 Involucrum ciliated variegated, Leaves sessile linear downy, Stem 1-headed
12549 Scales of the involucre serrated, Leaves linear entire the owermost toothed
12550 Involucrum ciliated egg-shaped, Scales flat close-pressed Lower lvs bipinnatif upper pinnatif Stem panicled
12551 Involucrum ciliated, Root lvs undivided and pinnatind smooth, Stem lvs downy pinnatifid, Branches spinous

and Miscellaneous Particulars.

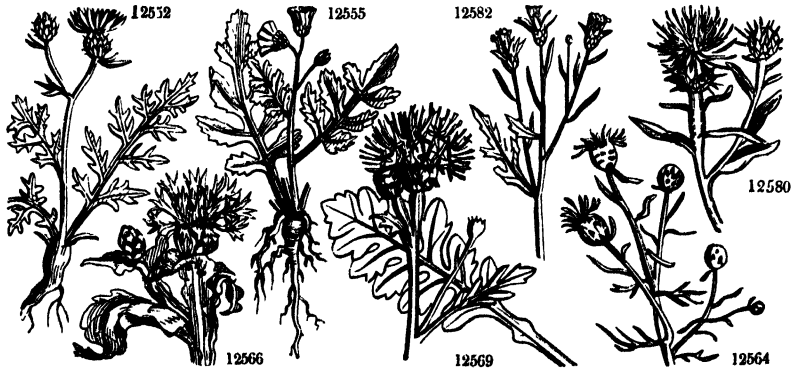
1819 *Centaurea.* It is said, that with this plant, the *Centaur* Chiron cured the wound in his foot made by the arrow of Hercules Crupina is from the Dutch verb *kruipen*, which signifies to creep; because the dark multifid pappus resembles the legs of a creeping insect.

Phrygia signifies dry (φρυγ ιος), in allusion to its calyx

Jacea is said to have been so named from *jacere*, to lie down, on account of its prostrate habit.

Calcitrapa, the Latin of a caltrop, or iron ball covered with stiff spines, formerly used in warfare to impede the operations of cavalry Its calyx is very like one of these instruments

Centaurea Crocodilium is so named, because the spines of the calyx have been fancifully likened to the claws of a Crocodile.



Verutum, the name of another species, is the Latin of a short javelin used by the Roman foot-soldiers The spines on its calyx resemble a small dart

C. nigra is a harsh stubborn weed in meadows and permanent pastures, seldom touched by cattle either green or in hay, and with difficulty extirpated C cyanus, *Bluet*, Fr., *Kornblume*, Ger., and *Cano*, Ital., is a common weed in corn fields, on gravelly soils, throughout Europe, and also a popular border annual The expressed juice of the natural florets makes a good ink; it also stains linen of a beautiful blue, but the color is not permanent. C. benedicta was so called from its being supposed to possess extraordinary medical powers, it was

History, Use, Propagation, Culture,

said not only to destroy worms and cure fevers, but also the plague, and the most putrid and stubborn ulcers and cancers. At present it is in no estimation whatever

It has by some botanists been thought advisable to separate this genus into several others; but the differences upon which the separation has been made depend upon variations in the form of the involucrurs,

12552 Involucre ciliated, Leaves downy very white all compound · lowest bipinnatifid, highest pinnate-laciniated
12553 Involucre ciliated, Leaves somewhat downy cinereous: lower ones pinnate-laciniate, upper ones simple
12554 Involucre ciliated, Lvs. downy undern. Root lvs bipinnatifid: segm. lanceolate acute, Stem-leaves pinnatifid
12555 Involucre serrated, Leaves downy · root ones pinnated, upper 1-eared
12556 Involucre ciliat. smooth, Lvs pinnatif. scabr. Segm. obl. lanc. acute highest root ones sometimes cut at base
12557 Involucre ciliated sphacelate, Scales spreading, Leaves obl. lanc. entire villous downy · cauline decurrent
12558 Involucre scales roundish egg-shaped ciliated, Leaves oblong lanc. undivided very scabrous acute serrated
12559 Involucre scales ovate lanceolate serrate-ciliated, Leaves bipinnatifid, Segments lanceolate
12560 Involucre egg-shaped smooth, Scales somew. scar. at tip, Lvs greenish decurr. undivided radical ones lyrate
12561 Involucre scales scar. at tip serr. Lvs. scab. at edge root ones obl. tooth., stem ones lanc. somew. decurr. quite ent.
12562 Scales of the involucre ciliated ovate pubescent, Leaves pinnatifid roughish the segm. lanceolate acute
12563 Involucre ciliated nearly globular, Leaves deeply pinnatifid, Segments linear
12564 Involucre. ciliated ovate roundish beautifully spotted, Leaves slender bipinnatifid, Stem a little panicled
12565 Involucre ciliated oblong, Leaves pinnatifid linear quite entire
12566 Involucre serrated, Leaves oblong serrated decurrent and undivided [branched divaricated
12567 Involucre ciliat. Scales ovate-lanc. spread at tip, Lower lvs bipinnatif. lanc. lin · upper ones pinnatifid, Stem
12568 Involucre ciliated, Leaves lanceolate serrated lowest tooth elongated so as to appear like a stipule
12569 Involucre ciliated, Leaves downy pinnatifid, Segments obtuse egg-shaped quite entire outer ones largest
12570 Involucre ciliated, Leaves scabrous underneath pinnatifid, Segments lanceolate sometimes toothed
12571 Involucre scarious, Scales ovate lanceolate serrated ciliated, Leaves scabrous beneath: radical bipinnatifid

§ 2. CALCITRAPA. *Involucrum ciliated with spines*

* *Spines simple* [panicled

12572 Involucre erect feathery, Head without a neutral ray, Lower lvs pinnatif upper ones lin. All quite ent. Stem
12573 Involucre ciliate-spinous egg-shaped, Scales reflexed at tip, Lvs hoary root ones lyrate, stem ones linear
12574 Involucre ciliate-spinous at tip, Spines of lower scales reflex. Lvs pinnat. Pinnæ lin. obt. Root leaves bipinnat.
12575 Involucre ciliate-spinous, Leaves lyrate-pinnated generally entire terminal lobe large toothed
12576 Involucre ciliate-spinous, Stem-leaves pinnatifid root ones bipinnatifid, Segments lanceolate
12577 Involucre ciliate-spinous, Stem leaves pinnated root leaves bipinnated, Pinnæ linear-filiform
12578 Involucre ciliate-spin. at tip, Stem-lvs pinnatif. lin. lanc. root ones bipinnatif. Segm. lanc. terminal 1-toothed
12579 Involucre ciliate fringed with straight rigid white bristles, Lvs. obl. a little toothed, Head yell. without a ray
12580 Involucre simply spinous, Spines spreading, Florets equal, Leaves hairy lower ones pinnatifid
12581 Involucre bristly spinous, Leaves lanceolate petioled toothed near the base
12582 Involucre scarcely spinous somewhat awned rayed, Leaves pinnatifid
12583 Involucre ciliated spinous, Stem-leaves pinnated quite entire root-leaves bipinnatifid
12584 Involucre ciliate spinous at the tip, Leaves hoary pinnatifid quite entire upper ones linear-lanceolate
12585 Involucre ciliate subspiny, Leaves oblong downy sessile somewhat toothed, narrowed at base deeply toothed

** *Spines palmate*

12586 Involucre palm.-spin. Spines reflex Lvs obl. smooth embracing the stem ½ decurr. repand tooth Teeth prickly
12587 Involucre palm.-spinous, Spines reflex Lvs. obov. somew. tooth stalked floral somew. decurr. mucro.-toothed
12588 Involucre palm.-spin. Spines reflex Lvs obl. hoary embrac. stem ½-decurr. tooth cut at base, Teeth rather prickly
12589 Involucre palm. spinous, Lvs decurr. not prickly root ones pinnatifid, terminal lobe very large
12590 Involucre palm spin. Spines reflex larger than calyx, Lvs hoary obl. sess. decurr. pinnatifid, Teeth not prickly
12591 Involucre palmate spinous, Lvs ovate-lanc. petioled toothed
12592 Involucre palmate spinous solitary sess. Lvs lanc. a little embracing the stem pinnatifid toothed
12593 Involucre. palmate spinous, Stem lvs lanc. toothed decurrent root lvs lyrate obtuse
12594 Involucre palmate spinous, Spines 3 or 5, Lvs lanc. sessile toothed
12595 Involucre ciliated surrounded by a whorl of long lvs Lvs lyrate toothed obtuse
12596 Involucre palmate spinous, Lvs embracing the stem runcinate pinnatifid prickly · toothed root ones lyrate
12597 Involucre. doubly spinous woolly bracteated, Leaves half decurrent toothed spiny
12598 Involucre palm. spinous term. solitary, Spines straight, Lvs lanc. decurr. not prickly root ones lyrate
12599 Involucre palm spin. term. ones clustered sess. Spines straight, Lvs lanc. scabrous decurr. not prickly. lower stem ones a little toothed, root ones sinuated
12600 Involucre palm spinous solitary subsessile, Spines straight, Lvs lanc. scabrous toothletted decurrent
12601 Involucre palm spin. Spines spread. Lvs scabr. stem lvs lanc. a little embrac. stem finely tooth., root ones lyrate
12602 Involucre palm spinous solit. Spines straight inner scales scarious at the tip, Lvs downy lanc. decurr. lower ones finely toothed pinnatifid at the base
12603 Involucre palmate spinous terminal sess. glomerated, Leaves petioled pinnatifid cut-toothed

*** *Appendages of involucrum spiny-pinnate*

12604 Involucre doubly spinous woolly, Lvs. half decurrent entire and sinuated, Stem proliferous
12605 Involucre doubly spinous sess. Lvs pinnatifid toothed, Stem divaricated spreading hairy
12606 Involucre. somewhat doubly serrated, Lvs embracing the stem lanc. undivided serrated [entire decurr.
12607 Involucre palm spin. midd. spine very long, lat. ones short, Root-lvs sinuate-pinnatif. Stem ones lanc. quite
12608 Involucre. doubly spinous somewhat woolly, Lvs sess. lanc. entire and toothed, Stem proliferous

and Miscellaneous Particulars

unconnected with differences of organization, they are therefore not adopted here. The tribe of Centaureæ of M. Cassini is not distinguished from Carduineæ by any very important characters. The greater part of the species are natives of Europe and Asia, several of Africa, a very few of America, and none of the southern parts of the world.

History, Use, Propagation, Culture,

C moschata is a handsome border annual, of which there is a white-flowered variety. C Centaurium, montana, splendens, and glastifolia, are among the most ornamental of the perennials

1890 *Galactites* A plant formerly included in Centaurea, and named on account of the milky veins of its leaves (γαλα, milk).

1821. *Wedelia* Named after George Wolfgang Wedel, a German, born in 1625, died in 1721 He was professor at Jena, and published many learned dissertations upon the plants of the ancients There was also a John Adolphus Wedel, professor in the same university.

§ 3. CROCODYLIUM *Involucrum not ciliated, but spiny at end*

12609 Invol. globul smth Spine very small weak a little reflex. Lvs lanc serrat · root ones lyrate, Stem divaricat
12610 Invol simply spinous villous, Lower lvs lyrate toothed upper ones lanc Peduncles very long
12611 Invol. scarious simply spinous, Lvs. pinnatifid quite entire terminal : segm larger toothed

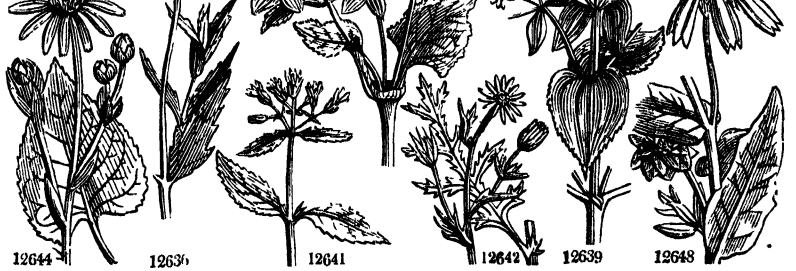
§ 4 RHAPONTICUM. *Leaves of involucrum with a round scarious appendage, which is often lacerated.*

12612 Invol. scales lacerated, Lvs ovate-obl. finely toothed tomentose [ones lyrate
12613 Invol. conical hard, Scales ending in a patulous point, Lvs somew tomentose decurr undivided root
12614 Inv. egg-shap Scales mucronat Lower lvs bipinnatif lin upper one pinnat Pinnæ lin sometimes toothed
12615 Invol ciliated, Scales acum somew thorny, Lvs obl pinnatif. Florets of the ray longer than those of disk
12616 Invol. scarious, Scales dilated cut, Lvs linear-lanc radical cut
12617 Scales of invol. scarious torn lower ones pinnatifid, Lvs. lin lanc. the lower ones broader and toothed
12618 Invol. scales roundish quite ent. Lvs obl smth root ones serrat Stem ones sometimes slightly cut at base
12619 Invol scales entire mucronated, Lvs pinnate toothed · stem ones linear toothed at the base
12620 Stems decumbent, Lvs lanc quite entire
12621 Invol. cylindrical, Scales mucronated, Lvs pinnated, Pinnæ lin mucronated quite entire
12622 Invol scales egg-shaped obtuse ciliated, Lvs downy on both sides pinnatif and undivided, Stem declining
12623 Leaves undivided quite entire decurrent
12624 Invol scales pectinate ciliated, Lvs deeply pinnatifid, Segm linear lanceolate [the stem decurrent
12625 Invol conical, Scales quite ent Lvs coriaceous reticularly veined root ones lyrate, stem ones embracing
12626 Leaves lanc. toothed somewhat petioled, Peduncles filiform leafless

§ 5. *Leaves of involucrum neither ciliated, nor spiny, nor with a scarious appendage*

12627 Invol roundish smooth, Scales egg-shaped, Lvs lyrate toothed
12628 Invol scales egg-shaped, Lvs pinnated, Leaflets decurrent serrated
12629 Invol scales egg-shap obt Lvs pinnat smooth, Leafl cartilagin sharply serrat termin one obl egg-shaped
12630 Invol round smooth, Lower lvs broad somew spatul tooth upp ones lyr at base, Head yell sweet scent
12631 Invol scales linear awl-shaped, Leaves pinnated serrated
12632 Invol scales mucronate, Leaves somewhat decurrent lyrate toothed
12633 Invol pubescent, Scales roundish obtuse, Leaves deeply pinnatifid lowest segments toothed
12634 Invol. scales egg-shaped obtuse, Leaves pinnated smooth quite entire odd one serrated

12635 Invol bristly spinous, Leaves decurrent sinuated spinous downy underneath



NECESSARIA.

12636 Leaves lanceolate acuminate serrated with a large tooth on each side at the base
12637 Leaves ovate-lanceolate, Invol urceolate squarrose, Rays imbricated
12638 Stem herbacaous, Leaves rhomboid narrowed at base connate

12639 Leaves stalked roundish-ovate narrowed at base floral subcordate, Pedunc terminal dichotomous
12640 Leaves stalked oblong ovate ciliated, Pedunc terminal aggregate

12641 Stem winged, Heads pale-yellow small

12642 Radical and cauline leaves pinnatifid, Stem hirsute
12643 Cauline leaves sinuate pinnatifid radical ternate sinuate multifid
12644 Leaves alternate ovate serrated scabrous radical cordate
12645 Leaves opposite deltoid stalked perfoliate, Stem square smooth
12646 Lvs opp conn unequally toothed, Stem smooth square, Four outer sc of invol. longer than the inner
12647 Leaves sessile stalked, Stem round scabrous
12648 Leaves opposite or alternate sessile oblong hairy lower serrate, Stem round hispid
12649 Stems 6-angled, Leaves ternate ovate toothed, Panicle trichotomous
12650 Stems round, Leaves ternate somewhat toothletted, Panicle dichotomous
12651 Stems round, Leaves about 4 toothletted, Panicle dichotomous

and Miscellaneous Particulars

1822. *Milleria* So named by Linnæus, after Philip Miller, F R. S., the well known author of the Gardener's Dictionary, and considered the first botanical gardener of his time He was born in 1692, and died in 1769

1823. *Baltimora* This plant grows in the neighbourhood of Baltimore

1824 *Silphium.* D'Herbelot asserts, that *silphi* or *serpi*, was a name given by the natives of Africa to the plant which produced the *laser* of the Romans, a substance held in great esteem among them for its flavor and its medicinal properties All the species are tall herbaceous plants with bright yellow flowers, and are very proper ornaments for a shrubbery.

History, Use, Propagation, Culture,

1825. *Trixis* From τρεις, three, on account of its triangular capsule with three cells

1826 *Polymnia.* Polymnia was the name of one of the Muses Why it has been applied to this plant is not very obvious. A coarse broad-leaved weedy plant.

1827. *Chrysogonum* From χρυσος, gold, and γονυ, a knee The bright yellow flowers are usually produced in the bends of the stems

1828. *Melampodium* One of the Greek names of black hellebore, with which the modern plant has no relation. The plant of the ancients was probably named from the blackness of the roots, (μελας, black, and πους, a foot).

1829 *Chaptalia* Dedicated by Ventenat to the famous French chemist, M. Chaptal. A pretty little North American herbaceous plant.

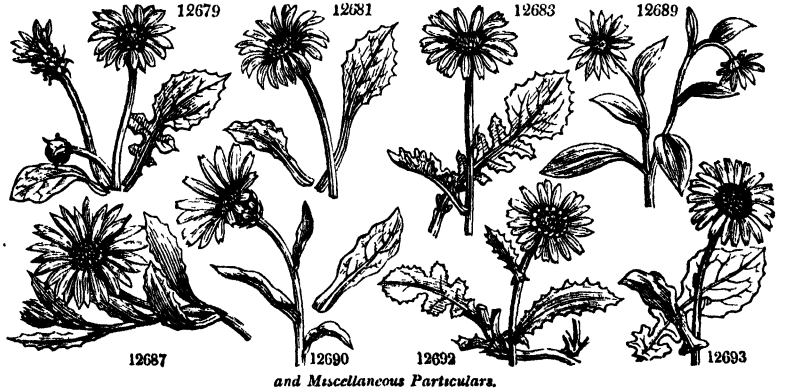
1830. *Calendula.* So named because it may be found in flower during the *Calends* of each month, or, which is the same thing, during every month in the year. C. pluvialis has been named from its flowers closing at the approach of rain.

12652 Herbaceous downy, Leaves sinuate pinnatifid toothed: cauline amplexicaul

12653 Leaves toothletted acuminate: lower pinnatifid; upper 3-lobed or entire
12654 Leaves 3-lobed acute running down the petiole: lobes angular sinuated
12655 Leaves opposite sessile oblong lanceolate somewhat toothed, Invol. 5-parted, Florets all female

12656 Leafstalks longer than leaves

12657 Stem erect, Leaves somewhat linear 1-toothed on each side
12658 Stem erect, Leaves lyrate-toothed sessile



12659 Leaves ovate-oblong entire silvery beneath, Scape naked 1-headed, Head nodding

12660 Pericarps cymbiform muricated incurved: outer lanceolate-subulate muricated at back
12661 Pericarps cymbiform muricated incurved outer ovate with a membranous edge toothed crested at back
12662 Pericarps cymbiform incurved muricated outer 5 ovate-lanceolate membranous toothed at edge
12663 Pericarps cymbiform all incurved muricated

12664 Pericarps urceolate obovate smooth, Involucre somewhat muricated
12665 Pericarps cymbiform smooth outer subulate erect somew muricat Lvs obl. spatul downy on each side
12666 Leaves narrow lanceolate sinuate toothletted, Stem leafy, Peduncles filiform
12667 Leaves oblong lanceolate blunt toothed, Stem leafy, Peduncles thickened at end
12668 Leaves lanceolate sinuate toothed, Stem nearly naked
12669 Leaves linear nearly entire, Stem nearly naked
12670 Leaves linear somewhat toothletted muricate dotted beneath, Pericarps orbicular, Stem suffruticose

12671 Leaves cuneate cut toothed glabrous, Invol downy ciliated, Stem shrubby weak
12672 Leaves opposite linear entire somewhat fleshy smooth
12673 Leaves obovate somewhat toothed, Stem fruticose decumbent
12674 Leaves obovate sublyrate roughish, Stem suffruticose erect
12675 Lvs obl toothed scabrous, Invol in fruit cernuous, Pericarps nearly orbicular, Stem fruticose panicled
12676 Peric cymbif incurv muricat outer lanc subulate muricated erect, Lvs obl spatul downy on each side
12677 Pericarps all uniform incurved cymbiform muricated, Leaves lanceolate toothletted acute smoothish
12678 Leaves oblong papillose scabrous lower toothed, upper entire, Stem shrubby

12679 Radiant florets fertile, Stem very short decumbent, Leaves hoary on each side ternate lyrate
12680 Radiant florets fertile, Leaves downy beneath ovate entire or lyrate-toothed, Scape furrowed 1-headed
12681 Radiant florets fertile, Leaves downy beneath wavy-toothed ovate or lyrate, Scapes 1-headed
12682 Leaves pinnatifid toothletted cobwebbed 3-nerved
12683 Radiant florets fertile, Leaves hoary pinnatifid repand somewhat toothed, Outer scales of invol reflexed
12684 Radiant florets fertile, Leaves lanceolate ovate nerved toothletted amplexicaul
12685 Radiant florets fertile, Leaves lanceolate linear entire downy
12686 Radiant florets fertile, Stem procumbent, Leaves spatulate-lanceolate repand-toothed hoary
12687 Radiant florets fertile, Stem procum Leaves obl. lanc unequally toothed hoary downy beneath 3-nerved
12688 Radiant florets fertile, Stem branched ascending, Leaves downy spatulate lanceolate 3-nerved pubescent
12689 Radiant florets fertile, Stem branched ascending, Leaves spatulate lanceolate entire 3-nerved downy
12690 Radiant florets fertile, Stem shrubby, Leaves hairy oblong undivided somewhat toothed
12691 Radiant florets fertile, Stem shrubby erect hoary, Lvs obov oblong vill toothed decurr down the petiole
12692 Radiant florets fertile, Stem ascend Lvs hairy hoary beneath lower lyrate-toothed, upper lanc tooth
12693 Radiant florets fertile, Stem snow white, Leaves lyrate amplexicaul downy toothed term lobe rhomb
12694 Radiant florets fertile, Stem erect, Leaves hairy oblong toothed, Outer scales of invol reflexed ciliated

and Miscellaneous Particulars.

C officinalis, *Souci du jardin*, Fr, *Goldblume*, Ger, and *Furrancio*, Ital, has been a garden plant time out of mind, and used in soups and broths, both to color them, and as comforters of the heart and spirits It had formerly many virtues ascribed to it, but is now totally out of use in this country According to Linnæus, the flowers are open from nine in the morning till three in the afternoon There are double, lemon-colored, and prolific varieties From the flowers of Calendula officinalis is obtained a distilled water, a kind of vinegar, and a conserve

With this genus for his type, M Cassini has formed a small tribe which he calls Calenduleæ, remarkable for a peculiar smell, very perceptible in the common pot-marygold, which is said to be confined to themselves alone. But this seems to be almost the only character by which they are distinguished from Heliantheæ The greater part of Calenduleæ are found in the country of the Cape of Good Hope, but some are found in Europe and Asia.

1831. *Arctotis* Vaillant, who named this genus, called it *Arctotheca*, from αρκτος, a bear, and θηκη, a capsule, because its fruit is shaggy like a bear. This and some neighbouring genera have given rise to M

History, Use, Propagation, Culture,

Cassini's tribe of Arctotideæ, which has the remarkable peculiarity of occasionally producing an ovarium with three cells. In the peculiarities of their style they approach the tribes of Echinopseæ, Cardumeæ, Centaureæ, and Carlineæ. They are entirely confined to the regions of the Cape of Good Hope.

1832. *Osteospermum.* From ὀστεον, a bone, and σπερμα, seed, in allusion to the hardness of the fruit.

1833. *Othonna.* Dioscorides mentions this name as being applied to various things, but especially to a plant with a leaf like rocket, but perforated with little holes, whence it was called Othonna, from ὀθονη, linen. The plant of the ancients can have had little affinity with that of the moderns.

1834. *Hippia.* A name applied by Cordus to the common Chickweed, because it was agreeable food for

12695 Radiant florets fertile, Stem erect, Leaves hoary viscid oblong amplexicaul mucronate-toothed
12696 Radiant florets fertile, Leaves pinnatifid lyrate angular toothed downy beneath
12697 Radiant florets fertile, Stem erect, Leaves pinnatifid scabrous downy beneath revolute at edge
12698 Radiant florets fertile, Outer scales of invol. reflexed cuneate obl. with a broad short point somew. cobw.
12699 Radiant florets fertile, Stem erect, Leaves pinnatifid lyrate hoary downy beneath, Invol imbricated
12700 Stemless, Leaves lyrate pinnatifid hoary beneath 3-nerved, Outer scales of invol. linear recurved
12701 Radi. flor. fertile, Stem erect, Branches downy hairy, Lvs. pinnatif downy ben : seg lin lanc angul downy
12702 Radiant florets fertile, Stem erect, Pedunc. hairy, Lvs pinnatif. hoary downy ben : seg lanc. angul toothed
12703 Radiant florets fertile, Stem erect, Leaves downy beneath : segm. linear subpinnatifid wavy
12704 Radiant florets fertile, Leaves hoary downy long-stalked pinnatifid. segm lanceolate blunt toothed

12705 Leaves lanceolate glabrous, Heads paniculed
12706 Leaves obovate serrate downy, Spines branched
12707 Leaves lanceolate pinnatifid-toothed scabrous, Spines branched
12708 Leaves lanceolate mucronate somewhat stalked smooth serrated, Branches toothletted angular
12709 Leaves obovate serrated stalked subdecurrent
12710 Leaves oblong toothed-angular scabrous ½-amplexicaul Branches furrowed
12711 Leaves toothed pinnatifid hairy, Branches unarmed
12712 Leaves pinnatifid smooth, Segments lanceolate unequally serrated
12713 Leaves lanceolate scattered decurrent smooth entire, Axillæ woolly

12714 Leaves pinnatifid · pinnæ lanceolate entire decurrent
12715 Leaves pectinate-pinnatifid downy segm. linear toothed at the edge
12716 Leaves pinnate filiform, Invol hemispherical many-toothed
12717 Leaves multifid pinnated linear, Joints of stem villous
12718 Leaves lanceolate 1 toothed on each side in the middle or entire, Peduncles axillary, Stem divaricating
12719 Lower leaves lanceolate entire upper sinuate toothed
12720 Leaves lanceolate 3-nerved entire, Stem suffruticose creeping
12721 Leaves deeply pinnatifid glabrous segments linear somewhat toothed, Stem herbaceous
12722 Leaves pinnatifid very small, Peduncles long slender axillary 1-headed, Ray longer than disk
12723 Leaves lanceolate entire somewhat fleshy, Stem erect
12724 Leaves oblong toothletted smooth narrowed at base amplexicaul. Heads paniculed
12725 Radical leaves ovate angular toothed cauline lanceolate entire
12726 Leaves entire radical lanceolate, cauline lanceolate subcordate ½-amplexicaul Stem erect
12727 Leaves entire: radical cordate, cauline ovate lanceol cordate at base amplexicaul Stem flaccid filiform
12728 Leaves ovate somewhat toothed, Peduncles 1-headed very long
12729 Root tuberous, Leaves amplexicaul Peduncles 1-headed
12730 Leaves lanceolate smooth amplexicaul Heads paniculed
12731 Stem dichotomous imbricated leaflets acerose, Peduncle very long solitary in the divarications
12732 Leaves filiform fleshy, Stem shrubby
12733 Leaves oblong entire, Stem arborescent fleshy with woolly scars
12734 Fleshy naked smooth a span high, Leaves fascicled obovate sessile, Peduncle 1-headed

12735 Shrubby villous, Leaves pinnatifid, Heads corymbose
12736 Hispid erect, Leaves ovate serrated 5-nerved, Racemes terminal

12737 Leaves pinnated · leaflets linear many-times lobed acute, Pericarps cuneiform hairy

12738 The only species

12739 Leaves entire and divided, Heads corymbose
12740 Leaves linear silky

12741 Stem erect prolifer. at summit, Lvs lanc downy acute, Fls capitate in the axils of branches and terminal
12742 Stem erect dichotom Lvs lin acum downy, Fls crowded axill. and term Clust much shorter than leaves
12743 Stem erect subdichotomous, Leaves lanceolate spatulate downy, Flowers clustered axillary and terminal

and Miscellaneous Particulars.

horses, ἵππος, a horse; and given to this plant by Linnæus for no reason whatever. Little plants resembling Tansy

1835. *Soliva.* Named by the authors of the Flora Peruviana, after Salvator Soliva, a Spanish physician and botanist.

1836. *Psiadia* From ψιας, a drop of dew, in allusion to the dew-bespangled foliage of the plants.

1837. *Eriocephalus.* From ερίον, wool, and κεφαλη, a head, on account of the woolly grains collected in terminal heads.

1838. *Filago.* All the parts of these plants are covered with delicate threads or *fila.*

History, Use, Propagation, Culture,

1839. *Micropus* From μικρος, small, and πους, a foot; so called with reference to Leontopodium (which see), than which it is smaller, but which it resembles in its velvety silvery leaves

1840 *Parthenium* The Greek name of the Matricaria, which see The indecent derivation of the word *Hysterophorus*, is sufficiently explained by Vaillant. (*Mem. Acad Sciences, anno* 1720)

1841 *Iva* This name, according to Fuchsius, is a mere abbreviation of *abiga*, see Ajuga. It has been applied by Linnæus to these plants because their smell resembles that of the ancient Iva

1842. *Acicarpha.* From ακις, a point, and καρφος, a palea, because that appendage is spiny

1843 *Elephantopus* It is said that some resemblance may be found between the radical leaves of this plant and an elephant's foot (ελεφας, an elephant, and πους, a foot)

1844. *Œdera.* After George Œder, a Dane, professor of botany at Copenhagen, and the founder of the extensive Flora Danica.

1845. *Flaveria* From *flavus*, yellow, because the plants are used in Chili for dying of that color.

12744 Stem erect subdichotomous, Lvs lin. lanc appressed downy, Flowers clustered axillary and terminal
12745 Stem erect branch Branch. sprdg Lvs. lanc acute cottony, Fls conic clust. lat term. Clust longer than lvs.
12746 Stem erect panicled, Leaves oblong lanceolate woolly, Heads clustered lateral and terminal downy
12747 Stem erect branched, Lvs lanc cord at base amplexicaul woolly, Heads clust. lat. and terminal downy
12748 Leaves nearly glabrous above, Spike longer more interrupted
12749 Stem herbaceous quite simple, Leaves oblong spatulate downy beneath hoary, Heads clustered
12750 Stem erect branched, Lvs obov spatulate downy beneath, Heads axillary and terminal clustered spiked
12751 Stem decumb branch only from base, Flower stems erect, Fls solit or racem Lvs lin downy on both sides
12752 Stem quite simple nearly erect about 3-flowered, Leaves linear acute downy, Runners procumbent
12753 Stem branched erect, Leaves linear 3-nerved acute very narrow at base downy beneath
12754 Stem simple, Leaves linear 3-nerved acuminate silky beneath, Heads terminal clustered [than lvs
12755 Stem very much branch diffuse woolly, Lvs lin-lanc downy, Fls in term crowded clust. which are shorter
12756 Stem simple nearly erect downy, Fls. axillary forming a distant leafy spike Leaves linear lanc. downy

12757 Leaves opposite obovate cuneate
12758 Leaves alternate lanceolate, Heads woolly

12759 Leaves bipinnatifid
12760 Leaves undivided oblong toothed

12761 Leaves lanceolate-ovate, Bractes lanceolate and petioles downy
12762 Leaves lanceolate dotted scabrous deeply serrated, Stem shrubby

12763 Leaves spatulate

SEGREGATA.

12764 Leaves scabrous · radical narrowed at base, cauline lanceolate, Stem branched strigose
12765 Radical and cauline leaves oblong narrowed at base somewhat hairy, Stem simple hairy
12766 Leaves ovate downy

12767 Leaves lanceolate serrated reflexed

12768 Leaves somewhat stalked lanceolate 3-nerved mucronate-serrate

12769 Leaves mucronate subulate reflexed, Stem erect
12770 Leaves linear subulate oblique, Spike cylindrical

12771 The only species

12772 Leaves lanceolate-linear smooth glandular beneath, Corymbs decompound
12773 Panicle decompound, Leaves lanceolate decurrent with their under surface and the branches woolly
12774 Corymb nearly sessile, Leaves small linear white beneath

12775 Leaves lanceolate serrate decurrent glabrous, Peduncles winged, Wings of stem and peduncles serrated
12776 Leaves decurrent ovate serrated, Peduncles round
12777 Leaves obovate serrated hairy decurrent, Peduncles winged, Wings of stem and peduncles serrated

and Miscellaneous Particulars

1846 *Stæbe.* The name under which Theophrastus and Pliny designate a plant of a rough and spiny habit. This is the character of the modern plant, which is very dissimilar to that of the ancients, which is believed to have been Poterium spinosum

1847. *Naumburgia* Named by Willdenow without explanation; but we presume in honor of John Samuel Naumburg, author of a Dissertation upon Veronica Chamædrys, &c, published at Erfurt in 1792.

1848 *Cassinia* Named after M Henri Cassini, a celebrated French botanist, who has devoted much attention to the study of the very difficult tribe of plants to which this belongs, and with singular success But his observations are scattered through so many different works, that it is almost hopeless to acquire a knowledge of their actual extent. Neat New Holland shrubs with white or yellow flowers.

1849 *Sphæranthus.* From σφαιρα, a globe, and ανθος, a flower, on account of the globular form of the heads of flowers.

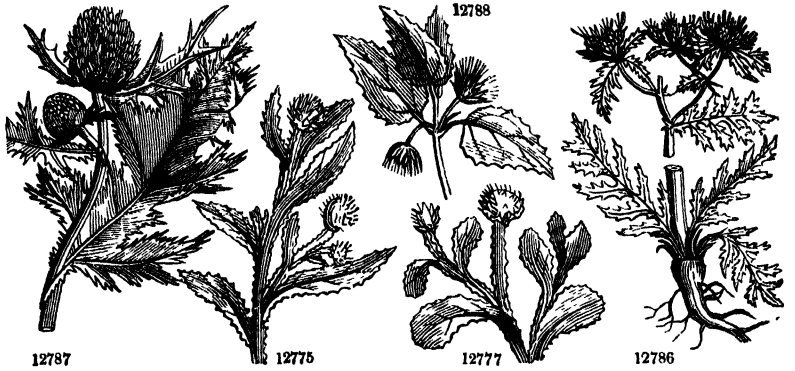
History, Use, Propagation, Culture,

1850 *Echinops* From ἐχῖνος, a hedgehog, and ὤψις, resemblance, because of the bristly round heads of flowers protected in every direction by stiff spines The woolly leaves of Echinops strigosus are employed in Spain as tinder Upon this genus M. Cassini has founded his tribe of Echinopseæ, which it must be confessed is entirely distinct from any other, and extremely remarkable on account of its very singular aberrations from the ordinary structure of Compositæ

1851 *Rolandra* After Daniel Rolander, a pupil of Linnæus, who visited Surinam Nothing appeared from him except an account of Dolichocarpus in the seventeenth volume of the Transactions of the Academy of Sciences of Stockholm



12778 Leaves pinnatifid downy above woolly beneath, Stem branched
12779 Heads scattered with long spines
12780 Head globose, Leaves pinnatifid smooth above
12781 Heads fascicled, Lateral involucre sterile, Leaves strigose on the upper side
12782 Stem branched woolly, Leaves subbipinnate: segments narrow smooth above, Head subsessile
12783 Leaves rugose squarrose pinnatifid smooth above glaucous with down beneath
12784 Stem simple upright 1-headed, Leaves eroded pinnatifid spiny-toothed smooth above downy beneath

12785 The only species

12786 Heads corymbose numerous

12787 Leaves long and spiny

12788 The only species

and Miscellaneous Particulars.

1852. *Brotera* Named after Felix Avelhar Brotero, a Portuguese botanist, professor at Coimbra; author of a useful Flora Lusitanica

1853 *Gundelia* Named after Andrew Gundelsheimer, a German botanist, who accompanied Tournefort in his journey into the Levant in 1709

1854 *Euxenia.* A name unexplained by its author Apparently derived from ξενος, hospitable, but in what sense we do not perceive.

CLASS XX. — GYNANDRIA.

THE singular plants which constitute this class are distinguished from all others by the anomalous structure of their flowers These do not, as is usually the case, contain a certain number of stamens surrounding a central ovarium or style, but on the contrary are furnished with a solitary fleshy undivided process, round which the sepals radiate, and which supplies the place of stamens and style The nature of this process has been variously explained the modern opinion is that it is formed by the accretion of the stamens and style into a single mass, and this opinion seems to be confirmed by analysis and analogy. Omitting, therefore, a notice of such theories respecting its nature as are opposed to that which is now received as the most correct, it will suffice to explain a little in detail, the opinion which is adopted in this work The central process, called the columna or column, is understood to be formed by the filaments of three stamens surrounding a style, and by mutual accretion firmly united with it and with each other into a solid mass Of these three stamens, it most frequently happens that the *two lateral* are sterile, and not furnished with even the vestige of an anthera; and that their presence is not indicated by more than two irregular excrescences, as in Orchis, or by the same number of small appendages, as in Satyrium, or by two horn-like or tooth-like processes, present in several of the genera with waxy pollen-masses · it even happens, and not unfrequently, that no vestige whatever of them remains But in Cypripedium both are fertile and bear perfect anthers, while the central stamen is barren and foliaceous When the lateral stamens are, as above stated, abortive, which is the most common form of the columna, the central stamen bears at its upper extremity an anther, which is either moveable or fixed firmly in its place The pollen which this contains, assumes three very distinct appearances in different tribes It is either granular, dividing into many separable small pieces, as in Orchis, or powdery, consisting of an infinite number of granules, as in Spiranthes, or waxy, when it consists of a few large concrete masses, as in Epidendrum The stigma is most frequently concave, and placed nearly under the anther, but in such a manner, that there is no contact between it and the pollen In what way, therefore, fecundation can take place among truly Gynandrous plants, is one of those mysterious contrivances of nature which has not yet been explained. It is generally believed to take place by absorption in some undiscovered manner, before the flowers expand, but it is extremely difficult to understand how this can occur in many genera The foregoing remarks apply only to the tribe of plants called Orchideous The few genera attached to the latter part of the class are Gynandrous by the cohesion indeed of their stamens and style, but in a much more obvious manner

Gynandrous plants are among the most interesting of the vegetable productions of the globe, whether we consider the vivacity of their colors, or the singularity of their organization, or the grotesque appearance of their tortuous roots, or the delicious perfume of their flowers They are distributed in abundance over all the earth. In Europe and the temperate parts of the world, they are principally found in meadows and pastures among grass, but in tropical regions they often constitute the chief beauty of the forest, occupying the forked branches of living trees, or the prostrate trunks of fallen timber, over which, in company with ferns and parasitical Aroideæ, they climb and trail in every direction, until they adorn the one with bright hues and rich odours foreign to their nature, and render the others more beautiful in death, than in the full vigour of their existence.

Order 1 MONANDRIA  Stamen 1

§ 1. *Anther terminal, erect Pollen granular, cohering by an elastic thread.*

1855 *Disa* Flowers ringent · helmet with a spur or bag at the base. Inner sepals united to the column. Lip without a spur

1856 *Satyrium* Flower ringent · five anterior sepals united at base. Lip behind, fornicate with two spurs or bags at the base. Anther resupinate. Stigma 2-lipped

1857 *Platanthera* Flower vaulted. Lip entire with a spur. Cells of the anther widely divided at their base by the broad interposed stigma Glands of pollen masses naked Lips of stigma absent.

1858 *Gymnadenia* Cor ringent Lip spurred at the base beneath Glands of the stalks of the pollen-mass naked, approximate

1859 *Orchis* Cor ringent. Lip spurred on the underside at the base Glands of the stalks of the pollen-mass (1-2) contained in one common little pouch

1860 *Nigritella* Ovary straight. Flower spreading Lip posterior, entire, with a scrotiform spur. Glands of pollen-masses distinct, and enclosed in a single 2-celled pouch

1861. *Habenaria* Cor ringent. Lip spurred on the upper side at the base beneath Glands of the stalk of the pollen-mass naked, distinct, with the cells of the footstalks adnate or separated.

1862 *Bartholina* Flower ringent inner sepals united below with the lip Lip spurred beneath at the base Stalks of the pollen-masses long, cells united to the column · glands distinct, half covered by the exterior lobe

1863 *Glossula* Sepals conniving in a galea the upper without a spur Lip anterior, spurred, 3-parted, with an inflated spur Pollen-masses 2, 2-parted, with 2 glands inclosed in distinct pouches.

1864 *Anacamptis* The flower of Orchis, from which it differs in having the gland of the pollen-masses single, with inflexed edges, and enclosed in a pouch

1865 *Accras* Flower ringent. Lip without a spur Glands of the pollen-masses included in a common pouch.

1866 *Ophrys* Flower somewhat spreading Lip without a spur Glands of the pollen-masses inclosed in two distinct pouches

1867 *Chamorchis* Ovary reclinate at end Flower galeate. Lip without a spur, undivided. Glands of the pollen-masses naked Upper lip of stigma divided Anther of Orchis

1868 *Herminium.* Flower somewhat spreading. Lip without a spur Glands of the pollen-masses naked, distinct.

1869 *Serapias* Flower ringent Lip without a spur. Column sharp-pointed Pollen-masses attached to a single gland inclosed in one pouch.

§ 2 *Anther parallel with stigma Pollen powdery*

1870. *Goodyera.* Cor ringent, with the 2 exterior or lateral segments of the perianth placed beneath the lip, which is gibbous at the base and undivided at the extremity. Column free. Pollen angular

1871. *Dauris.* Flower irregular Two outer linear sepals placed beneath the trifid lip, the inner clawed and spreading. Column with the lateral lobes petaloid. Pollen farinaceous.

1872. *Ponthieva.* Flower irregular. Lip behind, with the inner sepals inserted in the column. Pollen farinaceous.

1873 *Neottia.* Flowers connivent Lip sessile, 2-lobed, with no calli Anther terminal, sessile Stigma 2-lipped pervious, the front lip thickened.
1874 *Spiranthes* Spike spiral Ovary oblique at the end. Sepals connivent Lip clawed, parallel with columna, with 2 calli at the base, entire Anther terminal stalked. Stigma flat, cuspidate, membranous, finally split
1875 *Stenorhynchus* Like the last; but the lip adheres to the columna by means of the margins of its lateral lobes it has no callosities Stigma corneous, always entire
1876 *Lastera* Flowers connivent. Lip 2-lobed, sessile, with no calli Anther intramarginal, half covered over by the hooded clinandrium Stigma closed, nearly flat, with a strong transverse furrow.

§ 3. *Anther terminal, persistent. Pollen powdery*

1877 *Arethusa.* Lip united at base with the columna, at the end hooded, in the inside crested. Sepals 5, united at base Pollen angular
1878 *Calopogon* Lip at the back clawed, with a bearded inside. Sepals 5, distinct Column separate. Pollen angular
1879 *Pogonia* Lip sessile, hooded, crested inside Sepals 5, distinct, without glands Pollen farinaceous.
1880 *Epipactis* Lip ventricose below, the extremity either undivided or 3-lobed, the middle lobe the largest, connected as it were by a joint Pollen farinaceous
1881. *Calcana* Lip unguiculate, placed at the back, with a peltate hollow lamina, having a perforation on the outside Pollen farinaceous
1882. *Corallorhiza* Lip produced behind, adnate with the spur or free Column free Masses of pollen 4, oblique, not parallel.

§ 4. *Anther terminal, opercular deciduous Pollen waxy.*

1883. *Rodriguezia.* Perianth 4-leaved ringent Lip entire, unguiculate cornute at base, callous in the middle. Pollen-masses 2, with an elastic caudicula Stigma with 2 horns
1884 *Gomeza* Like the last, but lip not cornute at base
1885 *Cymbidium* Lip not spurred, concave, jointed with the simple base of the columna Sepals spreading, distinct. Pollen masses 2, 2-lobed behind
1886 *Brassia.* Lip expanded, undivided Sepals spreading, distinct Column not winged Pollen-masses 2, 2-lobed behind, fixed by the middle to a common process of the stigma.
1887 *Lissochilus* Pollen-masses 2, obliquely 2-lobed Lip saccate at base, sessile, undivided, convex at the base, united with the apterous toothless column Inner sepals divaricating, petaloid, outer reflexed, calycine
1888 *Geodorum* Lip cucullate-ventricose, sometimes spurred at base, sessile, not jointed with the column. Sepals like the lip, 1-sided Pollen-masses 2, lobed at back
1889 *Catasetum* Perianth not inverted, generally globose Lip saccate, concave, different from the sepals. Pollen-masses 2, 2-lobed behind, inserted on a large naked transverse caudicula, which finally separates with elasticity
1890 *Tyrzeuxis* Perianth 2-parted, upper segment 2-lobed, lower 3-parted, inflated Lip parallel with column, with a recurved dilated limb Stigma excavated. Anther 1-celled, fleshy. Pollen-masses 2, adhering to a fusiform caudicula
1891 *Xylobium* Perianth spreading Lip behind jointed, with an unguiform process of the column, 3-lobed, incumbent on columna Outer lateral sepals united by their bases, with the process of column. Pollen-masses 2, furrowed on one side, seated on a broad caudicula
1892 *Maxillaria* Perianth spreading Lip in front 3-lobed, jointed with the unguiform process of the column Lateral outer sepals united by their bases with the process of column Pollen-masses 2, bipartite, united by their bases to a common gland
1893 *Notylia* Perianth 4-leaved upper sepals spreading Lip divaricating entire Columna acuminate. Pollen-masses 2, entire Anther posterior, not terminal
1894 *Pleurothallis* Lip jointed with the simple or slightly lengthened base of column The two anterior sepals united at base Pollen-masses 2, not furrowed
1895 *Oncidium* Lip expanded, lobed, tubercled at base Petals spreading, sometimes only 4 Column winged Pollen-masses 2, 2-lobed behind, fixed by the middle to the common process of the stigma
1896. *Cyrtopodium.* Sepals 5, distinct Lip 3-lobed, connected with a joint with the unguiform process of the base of the apterous column Pollen-masses 2, 2-lobed behind.
1897 *Cœlogyne* Perianth resupinate, spreading Lip 3-lobed, cucullate, jointed with columna. Column winged Anther lateral, 2-celled Pollen-masses 2, 2-parted Stigma funnel-shaped, 2-lipped
1898 *Macradenia* Lip sessile, cucullate, concave, undivided, acuminate Sepals distinct, spreading Column distinct, with the lobes of its end conniving Pollen-masses 2, unfurrowed, seated on a long filiform caudicula
1899 *Dendrobium.* Lip without a spur, jointed with the unguiform process of the column, to whose edges the anterior sepals adhere Pollen-masses 4, parallel
1900 *Anæctochilus* Flowers erect Sepals conniving The two lateral exterior large, cohering at end two inner very small subulate Lip oblong, with 2 teeth near the base Pollen-masses 4, without gland or caudicula
1901 *Camaridium* Perianth resupinate, expanded Sepals distinct Lip distinct, sessile, cucullate, 3-lobed Column round Stigma arched. Pollen-masses 4, parallel, compressed, without a caudicula at the time of expansion.
1902 *Oxysthadium* Lip sessile, hooded, connate with the base of column. Sepals conniving Pollen-masses 4, oblique, furrowed at base
1903 *Isochilus* Lip almost of the same shape as the distinct, connivent, sepals Pollen-masses 4, parallel
1904 *Pholidota* Flowers resupinate Sepals uniform, the three outer erect, keeled at back. Lip ventricose Column dilated at end Anther 2-celled Pollen masses 4, each pair having 1 gland
1905. *Broughtonia* Column distinct, or at the very base united with the unguiculate lip, which is lengthened at the base into a tube, connate with the ovarium Pollen-masses 4, parallel, with a granular caudicula reflexed upon the masses.
1906 *Cattleya* Sepals spreading Lip sessile, cucullate, surrounding the half round column Pollen-masses 4, with as many powdery reflexed caudiculæ
1907. *Epidendrum* Column united with the claw of the lip, and forming a tube which sometimes runs down the ovarium. Pollen-masses 4, with as many powdery reflexed caudiculæ
1908 *Polystachya* Perianth not inverted, cuneate, closed Pollen-masses 4, placed on a simple naked caudicula with a gland
1909 *Cryptarrhena* Sepals 5, distinct, spreading. Lip not spurred, with a dilated flat lamina Column distinct, not winged Anther enclosed in the cucullate head of the column Pollen-masses 4
1910 *Ornithocephalus* Flowers resupinate Lip stalked Sepals nearly equal, the two upper finally reflexed Column short, with a very long beak Pollen-masses 4, adhering to a very long glandular caudicula
1911. *Bletia.* Lip sessile, cucullate, sometimes spurred at the base Sepals 5, distinct. Column separate. Pollen-masses 8 or 4, 2-lobed.
1912. *Eria* Perianthium woolly, conniving or expanded. Lip 3-lobed, jointed with an unguiform process of the column to whose sides the anterior sepals are united. Pollen-masses 8, cohering at the end by means of a powdery substance.
1913. *Octomeria* Lip jointed with an unguiform process, to the edges of which the anterior sepals adhere Pollen-masses 8. Perianthium quite smooth
1914. *Brassavola.* Lip with a simple claw, undivided. Sepals distinct, spreading Pollen-masses 8 or more

1915. *Sarcanthus.* Lip fleshy, entire, calcarate, the spur furnished with various appendages in the interior Sepals spreading equally Pollen-masses 2, seated on an elastic caudicula

1916. *Vanda.* Lip saccate, continuous with the simple base of the apterous column, trifid, with the middle lobe fleshy. Sepals spreading, distinct Pollen-masses 2, obliquely 2-lobed, attached to an elastic caudicula

1917 *Aerides* Lip spurred or saccate, inserted at the end of the unguiform process, to whose edges the anterior sepals are united Pollen-masses 2, two-lobed behind, fixed by a common process to the middle of the stigma.

1918 *Renanthera.* Like the last, but sepals very long and spreading, and lip only a little saccate at base

1919 *Ionopsis* Sepals connivent, the anterior placed under the labellum. Lip spurred at base Pollen-masses 2

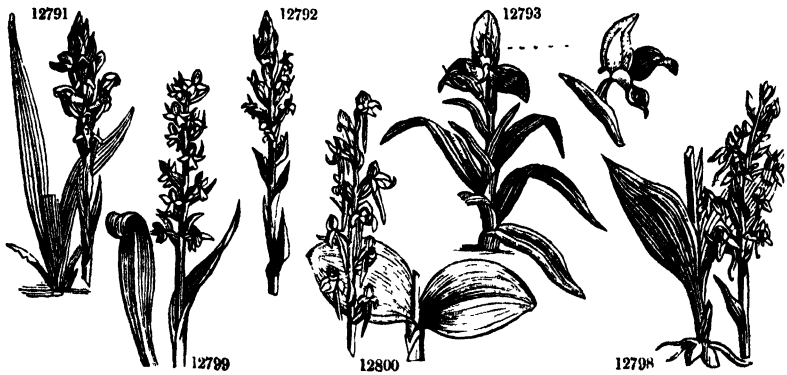
1920 *Eulophia* Sepals 5, distinct, uniform, ascending, spreading Lip spurred at base, with a sessile crested lamina, 3-lobed. Pollen-masses 2, two-lobed, with a posterior lobe attached to an elastic caudicula

1921 *Angræcum* Sepals conniving, galeate. Lip spurred 3-lobed, jointed with column. Pollen-masses 2. Stigma concave, transverse

1922 *Aeranthes* Lip spurred, membranous, entire, jointed with an unguiform process of the column, to which the two front sepals are adherent. Pollen-masses 2, hollow, perforated on one side, with no caudicula, and two glands.

1923 *Calanthe* Lip spurred, lobed, united with the columna. Perianth. spreading. Pollen-masses 8.

1924 *Stelis* Lip of the same form as the inner dwarf vaulted sepals Three outer sepals united at base. Pollen-masses 2



1925 *Malaxis* Lip flat, expanded, regularly vertical Column round Pollen-masses 4, loose.

1926 *Prescotia* Perianth. spreading Two upper sepals connate at base Lip behind, erect, fleshy, cucullate, entire, embracing the very minute column Pollen-masses 2, twin, granular, united by the end to a gland.

1927. *Macrostylis.* Lip flat, sagittate, or deeply cordate. Column very small, round. Pollen-masses 4, loose

History, Use, Propagation, Culture,

1855. *Disa* A name of unknown meaning, adopted by Linnæus from Bergius. Beautiful Cape herbaceous plants, with flowers of various colors, either growing singly, or in long spikes. Disa cornuta produces a spike, often a foot or a foot and a half long D grandiflora has large, nearly solitary flowers, of a brilliant scarlet color The species are cultivated without difficulty in a stove or in a greenhouse, if the roots are planted in light sandy peat, mixed with a very little loam, and not overwatered. The same treatment is suitable to the other tender tuberous or fibrous-rooted Orchideæ.

1856. *Satyrium.* The aphrodisiacal properties of Orchideous plants induced the ancients to give this name to almost all the species they knew, from σατυρος, a satyr The bag-like appendages of the lip have perhaps assisted in the application of the name The species are mostly handsome plants, with yellow or pink flowers Mr. Salisbury says, he preserved Satyrium cucullatum some years, by attending to planting the bulb in a pot, nearly full of broken tiles, mixed with pure sandy loam, and keeping it quite dry when not vegetating

1928. *Liparis.* Perianth. spreading. Lip flat, expanded, entire, turned various ways. Column winged. Pollen-masses 4, with neither caudicula nor glands

1929. *Calypso* Lip ventricose, spurred beneath near the end. Sepals ascending, 1-sided. Column petaloid, dilated. Pollen-masses 4.

§ 5 *Pollen granular. Seeds not arillate*

1930. *Vanilla.* Flower jointed with ovary, and deciduous. Lip united at base with columna. Capsule fleshy.

Order 2. DIANDRIA.  Stamens 2.

1931 *Cypripedium* Lip ventricose, inflated Column terminated by a petaloid lobe dividing the anthers Two anterior sepals usually united.

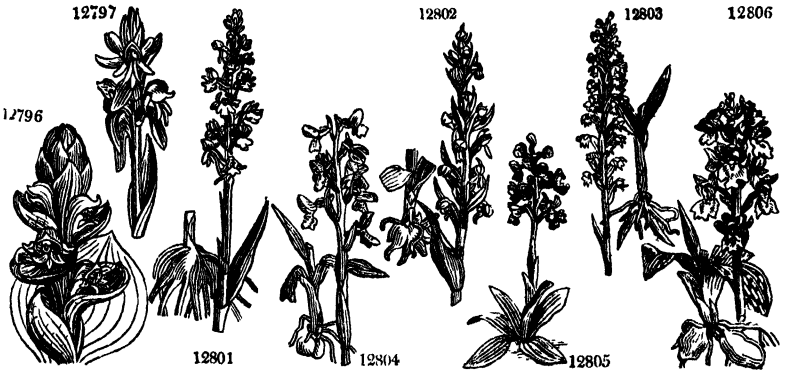
1932 *Stylidium* Cal 2-lipped Cor irregular, 5-fid, the fifth segment dissimilar. Column reclinate, with a double bend Anthers with 2 spreading lobes. Caps 2-celled

1933 *Gunnera* Cal. 2-toothed, superior. Cor. O Style 2-parted. Drupe 1-seeded, crowned by the teeth of the calyx.

Order 3. HEXANDRIA.  Stamens 6.

1934 *Aristolochia* Cal. O Cor. 1-petalous, ligulate, ventricose at base. Caps. 6-celled, many-seeded, inferior.

MONANDRIA.



12789 Helmet blunt spur conical deflexed, Inner sepals 2-toothed, Lip obovate velvety flat, Spike lax
12790 Helmet erect acute, Lip stalked dilated at end trifid, Stem few-flowered, Leaves linear
12791 Helmet blunt spur obl keeled convex at back, Lip linear acutish, Spike lax, Bractes shorter than fls.
12792 Helmet blunt spur obl Lip linear broadest at end, Spike cylindrical, Bractes erect longer than flowers
12793 Helmet acute erect spur conical nodding, Lip linear blunt, Stem about 2-fl
12794 Leaves filiform shorter than 3-flowered scape, Spur blunt ascending

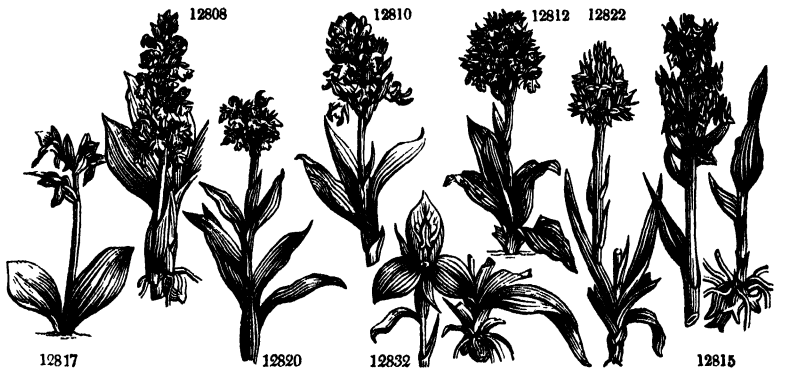
12795 Radical leaves twin cordate roundish concave · cauline remote cuculiate bluntish
12796 Radical leaves twin cordate roundish cauline sheath-like close, Spike compact, Sepals keeled outside
12797 Leaves ovate acuminate somew reflexed sheathing coriaceous crenated at edge, Fls and helmet cernuous

12798 Horn filiform twice as long as ovary, Lip linear entire, Rad leaves twin oblong narrowed at base
12799 Lip lanceolate obtuse dilated at base, Spur the length of lip a little shorter than the ovary, Stem leafy
12800 Lip linear lanceolate, Three upper sepals erect conniving lateral reflexed, Leaves 2 orbicular

12801 Bulbs palmate, Lip trifid entire, Spur setaceous twice as long as ovary
12802 Horn short double, Lip linear 3-toothed lateral teeth acute, middle very short
12803 Horn blunt 3 times shorter than ovary, Lip 3-parted: segments acute, middle one largest

[ovary
12804 Lip 3-lob.: lobes cren obt. midd one emargin Seg of perianth ascend. obt Spur cone ascend shorter than
12805 Lip 3-lobed. lateral reflexed toothletted, middle shorter than blunt, Spur long comp truncate ascending
12806 Lip 3-lob crenul. obt the midd lobe cleft, Seg of the perianth cleft, exterior one reflex Spur lin ascend compressed at the extremity rather longer than the ovary

and Miscellaneous Particulars.



1857 *Platanthera* So named from πλατυς, broad, and ανθηρα, an anther, on account of the width of that organ, which is as broad or broader than the base of the labellum Curious wood plants with greenish flowers.

Platanthera bifolia is one of our indigenous plants, which may be cultivated without any difficulty, if planted in pure loam from a lime-stone bottom It succeeds in a pot, if filled half full of broken tiles, and when in the open ground, the border should be well drained, at least six inches in depth. No plant bears forcing better, or exhales a more delightful perfume This species is never observed but in a lime-stone soil, and is exceedingly plentiful near Buxton.

1858 *Gymnadenia.* From γυμνος, naked, and αδην, a gland; because it differs from Orchis in not having the glands enclosed in a pouch, but altogether uncovered. The principal species of the genus is the Orchis conopsea of old botanists

1859. *Orchis.* The Greek name of the plant. In Arabic, according to Forskahl, it is called *sahlieb*, from

History, Use, Propagation, Culture,

whence doubtless our word *salep* has been obtained This is a curious and beautiful genus, but rather difficult of culture Few of the species produce seeds, but are propagated by their bulbs or tubers, which, in most of the species, are of a peculiar structure and economy An Orchis being taken out of the ground is found with two solid masses, ovate or fasciculated at the base of the stem, above which proceed the thick fleshy fibres which nourish the plant. One of these bulbs or tubers is destined to be the successor of the other, and is plump and vigorous, whilst the other or decaying one is always wrinkled and withered From this withered one has proceeded the existing stem, and the plump one is an offset, from the centre of which the stem of the succeeding year is destined to proceed By this means, the actual situation of the plant is changed about half an inch every year, and as the offset is always produced from the side opposite to the withered bulb, the plant travels always in one direction at that rate, and will in a dozen years have marched six inches from the place where it formerly stood

In the garden, the Orchis can hardly be said to be propagated, the species are generally taken up from their native habitations with balls, and transferred to a shady border, where they remain for a year or two, but seldom increase. Those which grow in the open fields are generally found in calcareous soil, and those in bogs or woods thrive best in peat, or peat and loam mixed. The culture of this genus, however, has been very little attended to According to Sweet, the best time to transplant the British Orchideæ, is when they are in a growing state.

The Orchis affords the preparation known as Salep, imported from Turkey, and other parts of the Levant; and which has also been made in this country from O mascula, and other species. The root is washed, the brown skin rubbed off, and then dried in an oven and ground into powder This powder, as an article of diet, is accounted extremely nutritious, containing a great quantity of farinaceous matter in a small bulk. O. mascula is very abundant in the meadows of Gloucestershire, and Salep has been made from its bulbs, equal to that imported. (*Encyc of Agr* 5527)

12838 Lip 3-lobed lateral short blunt : middle retuse

and Miscellaneous Particulars

Orchis fusca and militaris, according to Salisbury, succeed best in chalky soil, free from all manure whatever, but they will endure more moisture than would be supposed, for he found them in a very wet part of the meadow below the terrace, at Mill Hill, where they had, no doubt, been planted by Mr Peter Collinson. Gymnadenia conopsea affords another singular instance of this sort, which is found growing wild on the driest limestone, mixed with Anacamptis pyramidalis, and in bogs where one can hardly tread, mixed with Epipactis palustris.

1860 *Nigritella.* So named by M Richard, from *niger*, black, in allusion to the color of the flowers

1861. *Habenaria* From *habena*, a thong or rein, on account of the long spur of the flower, which resembles something of that sort. Most of the species have white flowers, and natives of America. Some have bright yellow flowers, others purple ones

1862. *Bartholina.* Named in honor of Thomas Bartholini, a Danish physician, who flourished at the end of the seventeenth century. A small Cape plant, with a beautifully fringed white flower.

1863. *Glossula.* So called by Mr Lindley, from γλωσσα, a tongue, in reference to the tongue-like segments of the labellum An obscure Chinese plant, with pale green minute flowers.

1864. *Anacamptis* From ανακαμπτω, to bend back, in allusion, it is presumed, to the reflexed edges of the appendage of the pollen-masses. In all respects similar to Orchis in habit It is the Orchis pyramidalis of Linnæus

1865 *Aceras.* From α, without, and κερας, a horn, in allusion to the absence of the spur from the labellum, by which character it is chiefly distinguished from Orchis Aceras anthropophora is difficult to cultivate It can only be propagated by seeds, which thrive best in a mixture of sand, loam, and chalk

1866 *Ophrys* From the Greek word οφυς, which signifies an eye-lash, to which the delicate fringe of the inner sepals may be very well compared. O apifera is a singularly beautiful plant, not uncommon on calcareous soils, near woods, and in open meadows. It ripens seeds plentifully, as will all the species, if care be taken, as

History, Use, Propagation, Culture,

Sweet directs, to "rub the pollen on the stigma." The seeds must be sown as soon as ripe, and the plants transplanted to where they are finally to remain, when of a small size Several species of this genus, and of Orchis, were successfully cultivated by Collinson, in his botanic garden at Mill-Hill. His method was to place them in a soil and situation as natural to them as possible, and to suffer the grass and herbage to grow round them O aránitera, with a little attention and management, will grow and flower freely in pots. Curtis found the following method successful · "take up the roots carefully when in flower, bare them no more than is necessary to remove the roots of the other plants, fill a large sized garden-pot with three parts choice loam moderately stiff, and one part chalk, mixed well together, and passed through a sieve somewhat finer than a common cinder sieve, in this mixture place your roots at about the depth of two inches, and three inches apart, water them occasionally during summer, if the weather prove dry, at the approach of winter place the pot in a frame under a glass, to keep it from wet and frost, which combined, destroy the beauty of the foliage, if not the plant itself, in the autumn, before any of the others make their appearance, this species emerges" (*Curtis, Fl Lond* n 68)

Salisbury says, that Ophrys muscífera, and most of its congeners, are very easily cultivated; but require the purest loam from a chalky bottom, and the border to be most effectually drained, for any permanent wet in summer makes them push too soon. On the hillocks and declivities where they grow wild, the slight showers are absorbed by the surrounding turf or long grass, and the heavy rains we usually have after midsummer-day run off quickly

1867 *Chamorchis* From χαμαι, dwarf, and *Orchis* A pretty little alpine plant, exceedingly difficult to cultivate Roots have been brought in damp moss from Switzerland, but they probably have perished ere *now*

1868 *Herminium* A name which is not explained by its author It is the Ophrys Monorchis of old botanists.

1869. *Scrapias* is the name of an Egyptian divinity, whose temples were notorious scenes of profligacy. In this sense, with reference to the uses of the plant, as also in Satyrium, the word seems to have been applied by Pliny. Rare herbaceous plants of the south of Europe, but cultivated in a frame

1870. *Goodyera* So called after Mr. John Goodyer, an obscure British botanist. The species grow freely in sandy peat, and, unlike most of the Orchideæ, may be increased by dividing the roots

12839 Lip 3-fid: middle lobe large 2-lobed, Anther blunt
12840 Stem leafy, Lip vill. 3-lobed: midd. lobe obov. shortly 3-lobed at end, Inner sepals linear-lanc. very short
12841 Stem leafy, Lip downy obov. 3-lobed at end: lobes nearly equal, Inner sepals lanc. twice as short as outer

12842 Leaves linear setaceous, Scape naked

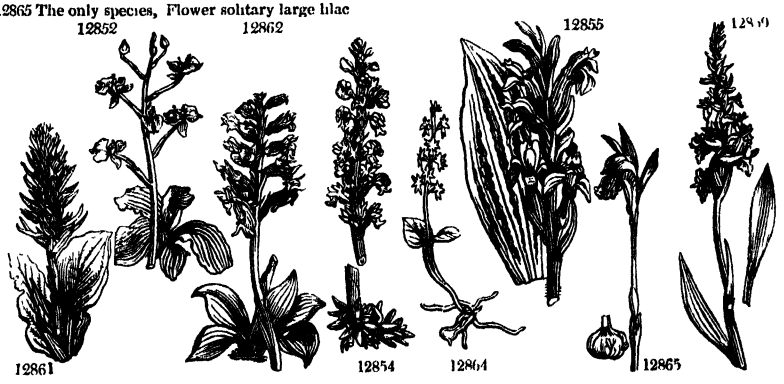
12843 The radical leaves lanceolate twin

12844 Lip 3-parted: middle lobe oblong lanceolate acute smoothish hanging down
12845 Lip 3-parted: middle lobe ovate acuminate hanging down with a hairy disk

12846 Radical leaves ovate, Lip and petals lanceolate
12847 Radical leaves ovate, Lip ovate acuminate, Sepals ovate
12848 Leaves fleshy chocolate-colored ovate without nerves
12849 Stem leafy, Leaves ovate-lanceolate stalked, Lip rounded glandular inside, Petals broad ovate
12850 A smooth variety of G. pubescens

12851 Leaves linear channelled shorter than scape, Middle segm. of lab. with a double keel inside

12852 Lip unguiculate acuminate, Inner sepals ½-ovate
12853 Spike lax erect, Leaves stalked erect crisp smooth, Flowers discolored



12854 The only species

12855 Rad. lvs obl lanc Scape with bractes, Anterior sepals decurrent placed under the ½-inferior labellum
12856 Lip obovate emarginate, Scape sheathed, Bractes shorter than flower, Leaves ovate stalked flat at edge
12857 Leaves linear-lanc Lip subsessile crenulate at end, Sepals ovarium and rachis quite smooth
12858 Lvs linear lanceolate 2-colored, Scape villous much longer than leaves, Fl gibbous on its outside at base
12859 Leaves lanceolate 3-nerved, Stem sheathed, Flowers recurved cernuous, Lip oblong entire acute
12860 Rad leaves oblong somewhat stalked, Spike twisted with the flowers on one side, Lip ovate

12861 Lip lanc undivided, Scape bracteate, Bractes longer than flower, Leaves oblong wavy towards the end
12862 Rad leaves broad lanceolate, Spike erect, Lip saccate at base with the sepals, Lip acuminate

12863 Stem with only a pair of ov-ellipt opp lvs Col of fructification having an appendage in which the anther [is placed
12864 Stem with only 2 cordate opposite leaves, Col without any appendage behind, Lip with 2 teeth at the base

12865 The only species, Flower solitary large lilac

and Miscellaneous Particulars

1871. *Dusris* From δις double, and ωσα, a tail, in allusion to the form of the sepals Beautiful New Holland plants, which may be cultivated in the same way as Disa

1872. *Ponthieva* Named after De Ponthieu, who sent many specimens of West Indian plants to Sir J Banks The species may be cultivated in pots, well drained, and filled with sandy loam and peat. Water must be sparingly given when the plants are not in a growing state

1873. *Neottia* This word in Greek signifies bird's nest, and has been applied to the present plant on account of the interwoven fibres of its roots No means of cultivating the only species has been yet discovered. It grows naturally in woods among decayed leaves, and is supposed to be parasitical

1874. *Spiranthes.* From σπειρα, a screw, or any thing spirally twisted, on account of the disposition of the flowers on their spike Delicate little herbaceous plants with fibrous roots, and generally white flowers. S. æstivalis has the germs on the flower-stalks placed regularly one above another, somewhat resembling tresses of plaited hair; whence its name of Ladies' traces or tresses This species grows more readily in the garden than most of its tribe

According to Salisbury, no plant whatever is more easy to cultivate than this At Chapel-Allerton it propagated itself every where, springing up from seeds in the neighbouring pots, whatever soil or plants happened to be in them, and they were once found germinating on a dead root of a Persian Cyclamen, in a pot, which, for want of draining, was full of Jungermannias

1875 *Stenorhynchus* A splendid genus of evergreen stove herbaceous plants, with brilliant red or yellow flowers They have been named from στενος, narrow, and ῥυγχος, a beak, on account of the long pointed stigma. N orchioides is one of the most beautiful plants of this genus, introduced by E. J A Woodford, Esq in 1806, from the Island of Barbadoes, where it grows wild in the most arid places among grass It requires, nevertheless, moderate waterings here while the leaves are green

1876 *Listera* Dr Martin Lister was a celebrated English physician and naturalist, who died in 1711 The species require a shady situation and a light sandy soil, with some peat intermixed They will grow on a bank under the drip of trees, or in small pots They are increased by dividing the roots

1877 *Arethusa* A poetical name. Arethusa was a nymph of Diana, who was transformed into a fountain. The species of this genus are all found in moist places. They are very impatient of cultivation The best way to manage them, is to plant them in loose wet peaty soil, and to keep them in a frame well exposed to the sun

History, Use, Propagation, Culture,

1878. *Calopogon.* From καλος, beautiful, and γωνια, a beard, in allusion to the beautiful fringe of the lip An elegant plant, which was introduced accidentally, as Mr. Curtis informs us, by the laudable exertions of his gardener, who, in the spring of 1783, examining attentively the bog earth which had been brought over with some Dionæas, found several tooth-like knobby roots, which, upon being planted in heat, afforded this plant: on the shelf of a stove, or on a bark pit it thrives exceedingly, and seems merely to require a longer and hotter summer than our climate affords.

1879 *Pogonia* A name with the same derivation as the last genus. The species also require the same treatment.

1880 *Epipactis.* A name given by the Greeks to a sort of Hellebore, and used by Swartz to distinguish a tribe of plants previously called Helleborine Pretty herbaceous hardy plants. "Some of its species thrive in the borders in the common garden soil, and most of them will do well in pots, in a mixture of loam and peat, they require but little water when in a dormant state, and are increased by dividing the roots." (*Bot Cult. 365*)

1881 *Caleana* Named after Mr George Caley, a most indefatigable and acute botanical collector, who resided several years among the natives of New South Wales, where he made a valuable collection of plants. The name has been subsequently changed by Mr Brown to Caleya which as being too similar to Calea, a very different plant, we cannot prefer to the original designation The species require the common treatment of the tribe, and are increased by division of the roots

1882. *Corallorrhiza.* From κοραλλιον, coral, and ριζα, a root, on account of its branched roots, which much resemble coral. A plant supposed to be incapable of cultivation It is a native of boggy places in the northern parts of the world. The three American species C verna, multiflora, and odontorhiza, are said to have been introduced in 1824, but we have not heard of their having been cultivated with any success.

12866 Leaves plaited long linear lanceolate The only species

12867 Root fibrous, Leaf of the scape and bractea elliptical lanceolate, Outer sepals oblong-ovate
12868 Root subpalmate, Leaf and bractea of scape linear oblong, Outer sepals lanceolate linear
12869 Leaves ovate squamiform amplexic Fls subcernuous solitary, Middle lobe of lip obl. crisp, Stem angular

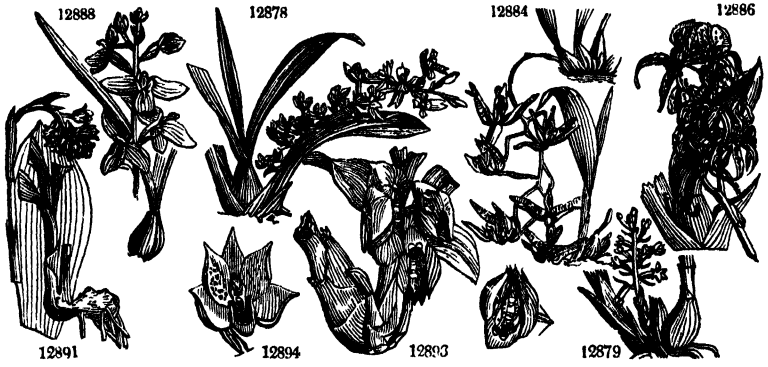
12870 Lvs ov amplexic Lower bractes long than fls Fls drooping, Lip entire acuminated shorter than petals
12871 Lvs lanc. amplexic. Bractes short. than fl Fls slightly drooping, Lip cren. obt. rather long than perianth
12872 Leaves ovate-lanceolate sessile, Bractes longer than the flower, Lip obtuse shorter than perianth
12873 Lvs. lanc much acum subdistich Bract very minute subul Fls erect, Lip obt much short than perianth
12874 Lvs lanc Bractes longer than ovary, Flowers erect, Lip acute with wavy elevated lines, Ovary smooth

12875 Leaf lanc lin. flat, Scape with a single bract in the middle, Lip smooth narrowed and ½-ovate at each end

12876 Spur abbreviated adnate

12877 Spikes nodding 1-sided, Leaves lanceolate complicate

12878 Spikes nodding 1-sided, Leaves lanceolate flat



12879 Stemless, Leaves growing on a bulb radical sheathing, Scapes many-flowered, Ovary 3-winged
12880 Leaves radical broad-linear channelled fleshy retuse at end, Scapes many-flowered pendulous
12881 Leaves radical ensiform nerved, Scape round few-flowered, Lip ovate somewhat recurved spotted
12882 Leaves radical ensiform nerved, Scape few-flowered, Flowers 1-sided, Sepals striated 3 outer reflexed
12883 Leaves radical lanceolate nerved narrowed at base, Scape round few-fl Lip obl recurved at end spotted
12884 Bulbous, Leaves plaited, Racemes divaricating pendulous radical
12885 Leaves thickish lin.-subulate channelled nerved crenate as long as scape, Spike few-fl Lip not spotted

12886 Sepals lanceolate spreading not longer than ovary
12887 Sepals linear lanceolate acuminate the lower caudate very much longer than ovary

12888 The only species A tall plant with long rigid linear lanceolate leaves on a bulbous base

12889 Scape longer than leaves, Raceme pendulous, Flowers alternate, Lip ovate acute painted
12890 Scape shorter than lvs. Spike pendulous, Fls close, Lip somewhat spurred at base blunt and entire at end
12891 Scape shorter than lvs Spike pendulous, Fls close, Lip somew spurred at base dilated and crenul. at end

12892 Two inner sepals spotted, Lip galeate 3-toothed
12893 Spike shorter than leaves, Leaves galeate fleshy 3-toothed at end, Sepals oblong inner spotted
12894 Spike short than lvs. Lip gal. blunt 3-tooth Two inner sep mott with purple, others as well as col green

and Miscellaneous Particulars

1883 *Rodriguezia* Named by the authors of the Flora Peruviana, after Emanuel Rodriguez, a Spanish physician, and, as it is said, of considerable botanical merit A beautiful herbaceous plant, growing upon decayed wood. Its flowers are placed in cernuous racemes of a lively pink color.

1884 *Gomeza* So called by Mr Brown, in honor of Senor Goinca, a Spanish apothecary. Mr Lindley thinks it not distinct from the last. A bulbous epiphyte, with drooping spikes of yellow flowers

1885 *Cymbidium* From κυμβη, a little boat, in allusion to the form of the labellum All the genuine species of Cymbidium are terrestrial, and rarely are found growing upon trees. In cultivation the species grow in loam, chips of wood, potsherds, and other rubbish, broken small, and put in well-drained pots They are increased by dividing at the root

1886. *Brassia* Named after Mr Brass, an intelligent gardener, who collected seeds and plants in Africa for the Kew Garden The two species now known are among the most beautiful of the various tribes of Epidendrums Brassia maculata has large pale yellow flowers, elegantly spotted with brown; B caudata has similar flowers, with long tails to their lower segments

1887. *Lissochilus* From λισσος, smooth, and χειλος, a lip, in reference to the absence of callosity or crests from that part An exceedingly rare and very noble plant, which grows freely in sandy loam with a little peat. The flowers grow in long spikes of a bright yellow color.

1888 *Geodorum* From γης, the earth, and δωρον, a gift, in reference to the beauty of the blossoms lying on the earth. Handsome plants, succeeding with the treatment of Cymbidium.

1889 *Catasetum* Apparently a word of hybrid extraction, from κατα, and seta, a bristle, in allusion to the two long bristles or horns of the columna, which constitute one of the most remarkable characters of the genus.

History, Use, Propagation, Culture,

Very fine epiphytes, with large bulbous roots, plaited leaves, and fine, often spotted, flowers of a greenish purple color The bulbs contain a quantity of viscid juice, which is used, when fresh, in Brazil, for the purpose of sealing letters The plants are there called *Cebolleta.*

1890 *Trizeuxis* So called by Mr Lindley without explanation We suppose the name has been formed from τρις, three, and ζευξις, union, in allusion to the remarkable union of three segments into one, which takes place in this genus A very singular epiphyte, which is with difficulty kept alive in the stove by being placed in finely pulverised decayed wood

1891 *Xylobium* From ξυλον, wood, in allusion to the substance upon which it grows A curious Brazilian bulbous epiphyte with plaited leaves This is of easy cultivation

1892. *Maxillaria* So called by the authors of the Flora Peruviana, as they inform us, because the labellum when looked at sideways, resembles the *Maxillæ* of some insects All fine South American plants, with plaited leaves and showy flowers They are cultivated like other epiphytes, and not with much difficulty

1893 *Notylia* So called, we presume, from νοτος, the back, and τυλος, a hump, in reference to a singular callosity at the back of the stigma, which Mr Lindley, the author of the genus, considers very curious. An unostentatious epiphyte without bulbs, and with solitary leaves, out of the bosom of which grows a pendulous raceme.

1894. *Pleurothallis* From πλευρα, a rib, and θαλλω, to flower, in allusion to the one-sided disposition of the flowers. Singular little epiphytes with solitary leaves, no bulbs, and flowers of a green color. They grow rarely in decomposed wood.

12895 Spike length of leaves erect, Flowers globose, Sepals rounded
12896 Perianth spreading, Lip opened out saccate crested

12897 The only species. Flowers very small in little heads upon a branched scape

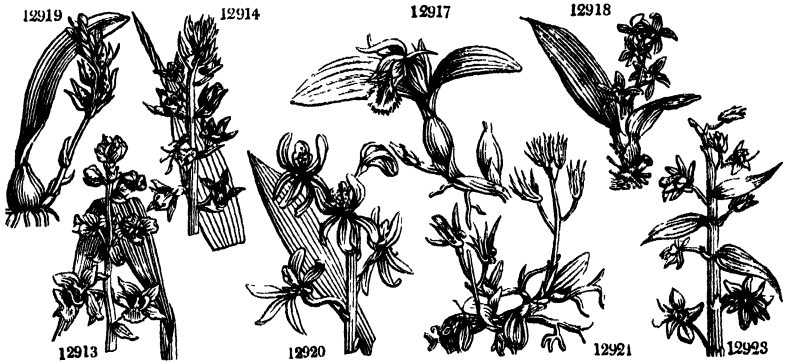
12898 Bulbs conical truncate, Flowers close, Leaves lanceolate plaited about 3-nerved twice as long as scape

12899 Leaves about 3 oblong nerved seated on a bulb, Scape about 1-flowered sheathed
12900 Lvs solitary lanc. plaited, Raceme 2-fl Perianth very large wavy spreading, Lobes of lip recurved crisp

12901 Spikes pendulous lax as long as the narrow oval nerved leaves

12902 Stem long 1-leaved, Scape erect longer than obl emarginate leaf, Fls racemose 1 sided
12903 Stem long 1-leaved, Leaf ovate-lanceolate, Flowers clustered in the bosom of the leaf

12904 Sepals 5 lanceolate longer than lip, Scape panicled
12905 Sepals 5 obovate unguiculate a little shorter than lip, Scape panicled
12906 Sepals 4 obov wavy, Lip long than sep midd lobe dilated reniform 4-lobed, Scape racem Bulbs 2-leaved
12907 Sepals 4 acute, Middle lobe of lip roundish undivided, Scape racemose, Leaves 2-cornered
12908 Leaves ellipt acute, Scape upright branched, Sepals wavy retuse spreading nearly equal, Lip reniform
12909 Lvs flat obl lanc Sepals 5 obovate undul ate blunt, Lip transverse shorter than seg bearded in the middle
12910 Lip 2-lobed spotted much longer than the sepals, Bulbs ovate comp leafy at base and end, Scape panicled
12911 Lvs rigid oval oblique, Panicle thyrsoid length of lvs Sep obov Lip 3-lobed crested, Wings of col ent
12912 Lvs solitary oval dotted spread Scape jointed 2-edged few-fl Upper sepals lin very long, Col 2-horned



12913 Lip narrow clawed lateral lobes divaricating longer than the middle which is hollowed out
12914 Lip ventricose lateral lobes shorter than middle which is crested and callous

12915 Bulbs fascicled, Lvs lanc atten at base, Sepals lanc finely dotted, Midd lobe of lip acute, Crest obsolete
12916 Bulbs and leaves coriaceous and shining
12917 Lvs. twin obl lanc spreading, Fls terminal solitary, Inner sepals filiform, Lip fringed with two crests

12918 Bulbs 1-leaved leafy at base, Leaves oblong 3-nerved, Spike erect shorter than leaves

12919 Leaves lanceolate keeled solitary on their bulb, Spike imbricated radical very little longer than the bulb

12920 Stems erect 2-3-leav at end, Lvs oval obl shorter than many-fl terminal raceme, Sepals narrow oblong
12921 Stems creep Lvs oval blunt depressed fleshy several times shorter than raceme, Sepals long linear acute
12922 Stems pendul Lvs bifarious lanc acum Ped opp the leaves about 2-fl Lip undivided ov cucul at base
12923 Stems pendul Lvs bifarious broadly lanc Pedunc about 2-fl Lip undivid tubul oblique almost truncate
12924 Leaves lanc striated, Racemes many-fl Lip undivided obliquely campanulate fringed
12925 Stem branched somewhat compr. tuberous at base, Leaves ovate-lanc Spikes erect, Fls remote alternate

and Miscellaneous Particulars

1895 *Oncidium.* From *ογκος*, a tumour, on account of the callosities with which the disk of the labellum is covered. Among the most beautiful of epiphytous plants, conspicuous by their long loose panicles of olive-colored or yellow flowers. Oncidium altissimum grows to the height of three or four feet. O Papilio, the curious Butterfly-plant of Trinidad, has large yellow and red blossoms poised on slender footstalks, and dancing about in the air like some gaudy insects All the species are cultivated without any difficulty in almost any soil, with plenty of heat and moisture

1896 *Cyrtopodium* From *κυρτος*, convex, and *τυς*, a foot, in allusion to the labellum of the original species These are handsome bulbous plants, growing either upon the ground or upon trees They are rather difficult to manage well, and are seldom seen in collections Their flowers, which are handsome, are rarely produced

1897 *Cœlogyne* So named by Mr Lindley, from *κοιλος*, hollow, and *γυνη*, a female, on account of the form of the stigma, which is peculiar for an Epidendrum Some of the species, natives of Nepal, which have not yet been introduced into our gardens, are most beautiful bulbous epiphytes, with shining fleshy leaves, and spikes of gorgeous flowers proceeding from a rigid imbricated scaly base

1898 *Macradenia.* From *μακρος*, long, and *αδην*, a gland, on account of the long subulate process to which the pollen-masses are attached A singular little epiphyte with yellowish brown flowers

1899 *Anisopetalum* From *α*, without, *ισος*, equal, and *πεταλον*, a petal, on account of the inequality of the sepals, or petals as they commonly called. A curious Nepal plant, with bulbous roots, and little erect spikes of brownish flowers

1900 *Dendrobium* From *δενδρον*, a tree, with reference to the habit of the species in growing upon trees In the woods of the East Indies they climb and twist themselves about the branches of live trees, or throw

History, Use, Propagation, Culture,

down their long shoots almost in the same manner as the Miseltoe in England. The flowers are generally very beautiful, and frequently highly fragrant they vary from a deep yellow to nearly white All the species in the gardens are cultivated without the least difficulty by being planted in any light vegetable earth. Sometimes they are put in baskets among damp moss, but they do not succeed so well under that treatment as when planted in earth.

1901 *Camaridium* Named by Mr Lindley, from καμαρα, an arched roof The stigma of this genus has the upper lip vaulted in a remarkable degree. An inelegant leafy caulescent bulbous epiphyte, with solitary white flowers

1902 *Ornithidium* From ορνιθος, a bird, in allusion to the resemblance which exists between the cuspidate upper lip of the stigma, and a bird's beak The habit of this plant is like that of the last, but the flowers are red. They are both cultivated without difficulty in a stove, by being planted among rotten wood, or tan.

Mr Salisbury says, Ornithidium coccineum is a parasite on old trees, near torrents, in the island of Martinico; its fibrous roots insinuating themselves into the crevices of their moist bark Here it thrives exceedingly, in pots filled with the same, flowering at various seasons, but chiefly in October and November During summer it should be placed in a shady part of the stove, and often sprinkled with water, but it requires little or none in winter, especially when plunged

1903 *Isochilus* From ισος, equal, and χειλος, a lip, because the lip and the other divisions of the flower are of nearly equal breadth The species grow in baskets of moss and old tan, or planted in pots of sandy soil, and chips of wood, and other dry rubbish They are increased by divisions at the root

1904 *Pholidota.* A singular bulbous epiphyte, native of Nepal, remarkable for the close manner in which the flowers are covered over by the imbricated scale-like bracteæ, from which circumstance (φολις, a scale), we

12926 Stems erect 2-3-leaved at end, Leaves oval obl. entire shorter than terminal many-fl. raceme
12927 Stem round jointed striated moniliform naked quite simple, Leaves oblong lanceolate
12928 Stems creeping, Leaves obl. lanceolate acute fleshy the length of the few-flowered spreading raceme

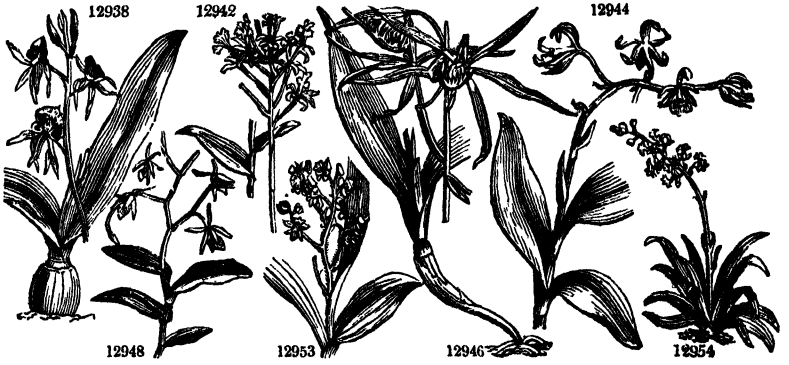
12929 The only species

12930 Flowers small and appearing in the axillæ of the long leaves, Stems branched bulb-bearing

12931 Spike terminal, Leaves distichous linear blunt emarginate, Stem simple
12932 Flowers axillary, Leaves distichous lanceolate oblong, Stem proliferous, Bulbs axillary 2-leaved

12933 Lvs solitary on a truncated conical naked bulb: lanceolate plaited, Raceme pendulous densely imbricated

12934 Leaves twin oblong seated on a bulb, Scape divided



12935 Outer sepals linear lanceolate acute 3 times as narrow as inner, Lip undivided
12936 Sepals nearly equal obtuse, Lip 3-lobed with the middle lobe saddle-shaped
12937 Sepals lanceolate. inner narrower wavy obtuse, Middle lobe of lip cordate lunate

12938 Leaves twin oblong seated on a bulb, Scape long, Lip cordate blunt
12939 Leaf lanceolate seated on a bulb, Scape short many-flowered, Lip cordate acuminate
12940 Stem simple, Leaves oblong emarginate, Peduncle terminal very long, Spike lax 1-sided
12941 Stem simple, Leaves obl or acuminate, Peduncle terminal long, Spike globose, Col. shorter than sepals

12942 Stem simple, Leaves oblong, Peduncle terminal long, Spike lax, Lip toothed ciliated
12943 Stem simple, Leaves obl somewhat emarginate, Flowers clustered in the bosom of a terminal leaf
12944 Stem simple, Leaves ov lanc amplexicaul Flowers spiked nodding, Lip 3-lobed. middle lobe 3-toothed
12945 Stem simple, Fls spiked erect, Lip 3-lobed middle lobe retuse, Inner sepals narrower, Leaves lanceol.
12946 Stem simple, Lvs twin oblong veinless, Lip 3-parted · middle seg subulate longest, lateral fringed
12947 Stem simple, Leaves 3, Spike remote few-fl Lip 3-parted middle segm linear, lateral cut fringed
12948 Stem simple 2-edged, Leaves oblong, Panicle terminal much branched, Lip cordate acuminate
12949 Stem simple, Leaves obl veinless, Flowers terminal, Lip 3-parted entire intermediate segm linear long
12950 Stem 1-leafed, Leaf ellipt lanc obt Raceme few-fl from the bosom of the leaf, Two inner sepals small
12951 Stem creeping bulbiferous, Bulbs 2-leaved 1-flowered, Lip cordate

12952 Spike compound spikelets alternate erect, Flowers smooth
12953 Spike panic. thyrsiform, Leaves lanc 7-nerved longer than scape, Fls. and ovaries downy, Bulbs ovate

12954 Leaves tufted lanceolate nerved shorter than erect spike

and Miscellaneous Particulars.

presume, Mr. Lindley has constructed the name No explanation, however, of his names is ever given by this author, who seems to attach too little importance to the etymology of botany.

1905. *Broughtonsa* Named by Brown, in the Hortus Kewensis, without explanation. A handsome plant, with fine scarlet flowers It is very rare, and cultivated with little success.

1906 *Cattleya* Named by Mr Lindley, after William Cattley, Esq. a munificent encourager of botany, and his early friend. A superb genus of bulbous epiphytes, with fleshy leaves growing in pairs, and large violet or yellow flowers

1907. *Epidendrum.* From *ἐπι*, upon, and *δενδρον*. All the species are found naturally growing upon trees, not however, as De Theis tells us, sucking their sap, by insinuating their little roots beneath the bark, but vegetating in the soil which collects upon the forks of the branches Many of the species have singular flowers, but none of those in the gardens are remarkable for their beauty They are generally cultivated with less difficulty than most other epiphytes. Salisbury tells us, Epidendrum ciliare should be planted in pots, filled with porous stones, a few decayed leaves, and knobs of bark taken fresh from the woods: but it requires very little water, and if the leaves turn yellow, it is a sign that they have either too much wet, or too much sun With such treatment by keeping four or five pots of it, the stove will be enlivened with their long tubular flowers, slowly succeeding one another, at most periods of the year. It is easily propagated by dividing its stems

1908 *Polystachya.* From *πολυς*, many, and *στάχυς*, a spike, on account of the compound nature of the inflorescence. Inconspicuous plants, requiring the treatment applied to similar kinds.

1909 *Cryptarrhena.* A pretty little stemless epiphyte with distichous leaves, and neat yellow flowers It was named by Mr Brown, from *κρυπτος*, concealed, and *ἀρσην*, a male, on account of the hooded apex of the column which covers up the anther. The plant is believed to be now lost to the gardens.

History, Use, Propagation, Culture,

1910 *Ornithocephalus* A very curious little plant, only an inch or two in height, found in Trinidad growing upon rotten sticks in the woods It bears two or three green flowers, which contain a column, the upper extremity of which is lengthened out into a fine subulate process, resembling a snipe's bill in miniature, whence the name, from ὀρνιθος, a bird, and κεφαλη, a head No successful method of cultivating this plant has yet been discovered

1911 *Bletia* Dedicated to Luis Blet, a Spanish apothecary, who has always, as we are informed by the authors of the Flora Peruviana, distinguished himself in his botanical studies Very noble plants, growing in the earth

Bletia Tankervilliæ is a common but beautiful species The first plant which flowered in this country, was cultivated at Apperly Bridge, near Bradford, in Yorkshire, in May 1776, and had been sent there to Mrs. Hird, by her uncle, Dr Fothergill, in a black Chinese pot full of stiff loam, in which it had been imported. Many small bulbs, with leaves like those of a snow drop, grew near the edge of the same pot in a regular circle, and these afterwards proved to be Amaryllis Aurea The Bletia Tankervilliæ delights in warmth, fresh loam, and plenty of water, by which treatment, and attention to fecundate the stigma, it will ripen fruit abundantly

1912. *Eria* From ἐριον, wool, on account of the woolliness of the flower of all the known species Curious epiphytous plants, with bulbous roots, and flowers usually of a yellowish color They differ from Dendrobium chiefly in the number of their pollen-masses, and in habit. E stellata is a fine free-growing plant, with long broad fleshy leaves, and spikes of beautiful brown-yellow flowers nearly a foot and half in length

1913 *Octomeria* So called by Mr Brown, with reference to the eight parts, οκτω, and μερος, into which the pollen is divided. A singular little plant, with filiform leaves and small nearly solitary flowers The true limits between this genus and the last remain to be determined The two seem to be separated by nature

1914. *Brasavola.* Named after Antonio Musa Brasavola, an Italian botanist, born at Ferrara in 1500 Plants with long subulate fleshy leaves, and large white flowers. They are cultivated without difficulty in peat and sand, if good decomposed wood is not to be procured

1915 *Sarcanthus.* A curious genus of plants not remarkable for their beauty Their habit is various, but always caulescent; their flowers either yellow or yellowish, marked with various shades of purple. The name

12955 Leaves distichous obtuse compressed

12956 Lip spurred undivided, spur short, Leaves radical ovate lanceolate
12957 Lip not spurred: ribs of the disk branched, middle lobe broader than long, lateral narrower upwards

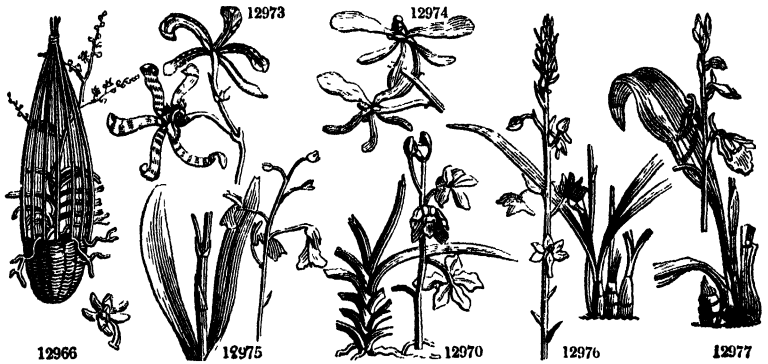
12958 Lip not spurred: ribs of the disk simple, middle lobe somewhat cuneiform, lateral broader at end
12959 Lip not spurred beardless, Pollen-masses 4, 2-lobed, Stem leafy, Flowers racemose
12960 Lip not spurred with a callus in the inside near the base, Stem leafy, Flowers capitate
12961 Leaves linear-lanceolate plaited, Sepals connivent, Scape higher than leaves

12962 Lvs. lanc. fleshy 5-nerved, Sep ov lanc. acum: midd lobe of lip acum Ovary and outer sep ferruginous
12963 Bulb obl.-ov. Lvs. distich. lanc smooth, Fls. loosely spik. Lip obl 3-lobed, Three exterior sep unit. at base

12964 Stem long 1-leaved, Leaf lanceolate, Peduncles twin 1-flowered, Root creeping

12965 Stem 1-flowered, Lip ciliated

12966 Stem panicled, Spur straight hanging down scarcely so long as ovary, Leaves bifid and unequal at end
12967 Leaves subulate, Lip spurred 2-celled, Raceme shorter than leaves
12968 Leaves lanc. flat somewhat recurved, Spike simple horizontal, Lip and anther rostrate



12969 Caulescent, Leaves remotely distichous broad linear channelled obtuse, Spikes opp the leaves
12970 Sepals oblong obovate wavy, Leaves obliquely 3-toothed at end
12971 Lip without a spur, Sepals linear-lanceolate nearly equal, Leaves cylindrical

12972 Spur ascending conical subulate, Middle lobe of lip shorter than lateral ones, Leaves blunt
12973 Stem branched rooting, Leaves lanceolate, Sepals revolute dilated at the end, Lip bifid in front

12974 The only species

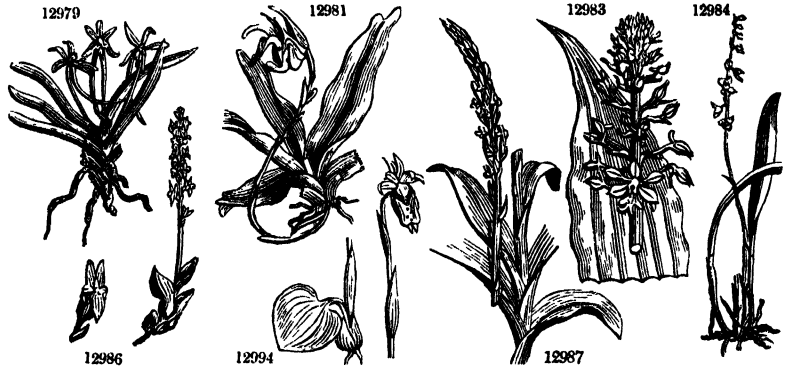
12975 Leaves lanceolate lined flat, Scape panicled, Sepals shorter than the lip

12976 Scape very slender 3 times as long as the lanceol 3-nerved leaves, Spur clavate, Midd lobe of lip obsolete
12977 Leaves lanceolate nerved, Spur ascending, Lip membranous complete

and Miscellaneous Particulars.

has been given by Mr. Lindley, from σαρξ, flesh, and ανθος, a flower, in allusion to the texture of the sepals and labellum.

1916 *Vanda.* The Hindoo name of the original species Noble caulescent plants adhering to old decayed arms of trees or fallen wood, by means of their tendril-like fleshy tortuous roots. The flowers of all the species are large and shewy Their treatment is the same as the next.



1917 *Aerides.* Derived from *aer*, the air, in allusion to the peculiar property the species possess of existing many months suspended in that element. This genus and the two last are those to which the name of Air-plant is most properly applied, very few others being capable of enduring for any considerable period such a removal from their natural places of growth The true species of this genus are beyond all comparison the most delightful productions of the vegetable world Their flowers are arrayed in long spikes or racemes of delicate colors and delicious fragrance. Hung up in a room in their native country, a little before flowering, they continue to unfold their blossoms in gradual succession for many weeks In this country they are rarely seen in flower. The only genuine species, the A odoratum, should be planted in rotten wood with a little peat, or a few decayed leaves, or any light black vegetable mould, and kept in the hottest and dampest place of the stove It put in baskets among moss and kept very damp, the plants will succeed for a short time, but they soon languish, and put on a yellow appearance, the certain indication of unhealthiness.

1918. *Renanthera* A name contrived by Loureiro, to express the kidney-form or reniform shape of the pollen-masses This plant is not uncommon in good collections, where it has sometimes acquired the height of six or eight feet, but it has never yet produced its flowers These appear, in the native country of the plant, in large loose panicles, and are individually of considerable size and of a rich crimson color, a little mottled with yellow

1919 *Ionopsis* So called by Mr. Kunth, from ιον, a violet, and οψις, resemblance I utricularioides is a pretty little epiphyte, with purplish falcate leaves. It succeeds ill under any management which has hitherto been applied to it.

1920 *Eulophia* From ευλοφος, well crested, with reference to the surface of the middle lobe of the lip. The two species in the gardens are terrestrial tender stove plants, with bulbous roots, plaited leaves, and flowers, in E. exaltata, green and inconspicuous, in E. guineensis, whitish pink, and very handsome. They should be treated like Cymbidium.

History, Use, Propagation, Culture,

1921. *Angræcum* A latinized form of the Malay appellation *angrec*, which is bestowed upon all epiphytous plants This is a pretty genus, remarkable for the distinct spur to the lip A. maculatum has handsome flat fleshy spotted leaves, and varies with flowers of a delicate pink and of a pale green color A luridum is an exceedingly rare species, with plaited leaves and conical bulbs covered with the vestiges of former leaves A falcatum is a little Japanese plant, whose flower has a spur nearly as long as the plant itself It is easily grown among loose moss in a warm damp place, but there should always be some bits of rotten wood mixed among the moss for the tender roots to adhere to

1922 *Aeranthes* A word with the same meaning as Aerides Fine Madagascar plants A sesquipedalis, which has not yet blossomed, bears in its own country very large white flowers, with a spur a foot and half in length The species are not caulescent as in Aerides, and the flowers appear singly, or two or three together, not in long racemes

1923 *Calanthe* From καλος, beautiful, and ανθος, a flower The genus consists of robust terrestrial, not epiphytous, plants, with long plaited leaves, and fine white flowers, remarkable for the curious conformation of the labellum They are easily cultivated as Cymbidium

1924 *Stelis* This was the Greek name of some parasitical plant found growing upon trees The modern genus consists of little inconspicuous West Indian plants, with solitary leaves, and minute green flowers disposed in long filiform axillary spikes They are not very easily managed, the best mode of cultivation is to plant them in very rotten wood with a little moss about them, and to keep them in a hot damp stove

1925 *Malaxis* From μαλαξις, softness, in allusion to the delicate texture of the genuine species. They are natives of moist places in marshes, and are scarcely capable of successful cultivation

1926 *Prescotia* So called by Lindley in compliment to his friend John Prescot, Esq, an English gentleman resident at St Petersburgh, and highly distinguished for his botanical acquirements. A curious little plant, with long spikes of green flowers It is easily cultivated in peat and sand

1927 *Microstylis* From μικρος, little, and στυλος, a column, on account of the minuteness of the columna. Little bog plants, resembling Malaxis in habit and manner of growth

1928 *Liparis* Probably derived from λιπαρος, unctuous, in allusion to the surface of the leaves of the original species, L Loeselii This genus consists of plants varying somewhat in habit, but agreeing in having pale green or greenish purple flowers, in terminal spikes or racemes. Part of the species are terrestrial, requiring the treatment of Malaxis; the remainder are epiphytes

1929 *Calypso* A poetical name, from καλυπτω, to conceal; not merely alluding to the covering of the stigma, but preserving an analogy between this botanical beauty, so difficult of access, and the secluded goddess, whose isle was fabled to be protected miraculously from the observation of navigators.

1930 *Vanilla.* An alteration of *vaynilla*, which is a diminutive of *vasna*, a Spanish word, signifying a sheath. The fruit is a long cylindrical pod, very like the sheath of a knife Vanilla aromatica produces the fruit of that name, which is used in England to flavor chocolate, and in Spanish America for that purpose, for perfuming snuffs, and as a medicine. The Spaniards have three different sorts, which they distinguish in com-

12978 **Leaves lanceolate spotted flat entire**
12979 **Leaves somewhat radical ensiform channelled falcate, Scapes few-fl. Spur filiform very long**
12980 **Stem compr. sheathing panicled, Branches quite simple spreading, Lip 3-lobed, Spur inflex. blunt emarg.**

12981 **Leaves 2-lobed and very unequal at end shorter than the weak radical sheathed scape, Spur emarginate**
12982 **Spur very long filiform, Spikes sheathed axillary**

12983 **Leaves lanc plaited nerved, Spike dense many-flowered, Bractes small lanceolate**

12984 **Stem 1-leaved, Leaves oblong lanceolate the same length as raceme, Flowers 3-cornered**
12985 **Stem long 1-leaved, Leaf broad-lanceolate shorter than raceme, Flowers 6-cornered**

12992 **Radical leaves unequal lanceolate entire acute fleshy about the same length as raceme, Lip oblong retuse**
12993 **Leaves lanceolate ensiform keeled, Raceme many-flowered, Lip 3-toothed at end**

12994 **Lip narr. at base somew clawed, Spur ½-bifid long than lip with acute teeth, Pedunc. longer than ovary**

12995 **Leaves ovate oblong nerved, Sepals wavy, Lip acute, Caps cylindrical very long**
12996 **Leaves oblong lanceolate flat obsoletely striated, Lip retuse**

and Miscellaneous Particulars

merce, viz ; the *pompona*, the *ley*, and the *simarona*. When the fruit begins to turn yellow, it is gathered and fermented in small heaps, in the same manner as is practised with the cocoa or chocolate pods (Theobroma) ; it is then spread in the sun to dry, and when about half dried, pressed flat with the hand and rubbed over with the oil of Palma Christi, or of the cocoa, it is then exposed to the sun to dry, the oiling repeated, and the pods covered with the leaves of the Indian reed to preserve them. The fruits which are brought to Europe are of a dark brown color, about six inches long, and scarce an inch broad, they are wrinkled on the outside, and full of a vast number of black seeds, like grains of sand, of a pleasant smell, resembling Balsam of Peru.

The species of this genus, like many other Epidendreæ, are falsely called parasitical, but are no more so than our Polypodium vulgare, which is often found growing on the trunks of old trees, especially pollards, rooted in the decaying bark. The Vanillæ shoot out roots at every joint like the Ivy, and may be either grown on a piece of a rotten trunk of a tree, or planted in a pot of rotten tan mixed with rubbish, and the stem trained against any surface which it can root into Like all the tribe, these plants require very little water.

Mr Salisbury has the following observations upon Vanilla planifolia. "It was discovered by Father Plumier, in the island of St. Domingo, where it grows wild, climbing to the tops of the highest trees; and is easily preserved in our stoves, throwing out one or more roots at every leaf, but as it seldom flowers here, I would recommend the following treatment — plant it at one end of a low bark stove, the temperature of which must be kept constantly hot and damp, never below sixty degrees of Fahrenheit in the night, during winter. Let the earth be fat loam, taken about an inch deep from the surface, in some old wood : mix this with a few decayed leaves and small pieces of rotten sticks, either in a tub bored full of holes, and sunk at the back corner of the bark pit ; or pale off a space of two square feet for it, draining the bottom a foot in depth very effectually with hollow tiles and porous stones. Select a healthy young plant to place in this earth, and as soon as it pushes vigorously, divide the stem, by pinching off its top, into three or four principal branches, which train backwards and forwards over that end of the bark pit, at two inches and a half distance from each other, on stout rods of a rough-barked elm nailed firmly across, the roots which issue from the bottom of the stem or branches must be suffered to penetrate into the earth, where they will swell and nourish the plants ; but if those beyond attempt to strike downwards, wind them gently along the elm rods, to which they will soon cling by small fibres, like those of Ivy. When the principal branches have extended to fifteen or twenty feet in length, divide them again by pinching their tops, as you find it necessary, into about a dozen branches in all, which must be left to flower, guiding them first horizontally, and afterwards in every possible direction, upon smaller rods of rough-barked elm, stuck into the bark pit at various angles. From the twentieth of March to the twentieth of September, shade that end of the stove by the light foliage of a Passiflora, trained all over the top, but pruned so thin as to admit the rays of the sun to play on the bed underneath : I prefer this method to a mat, for many reasons. Let the earth be always damp by gentle sprinklings of water, but never very wet, except in the great heats of summer, when I should be inclined to give the plant two or three drenching showers all over from a fine-nosed watering-pot, shutting up the house at night full of steam "

History, Use, Propagation, Culture,

1931 *Cypripedium* From Κυπρις, Venus, and ποδιον, a slipper, in allusion to the elegant slipper-like form of the labellum Handsome plants "which will only thrive in a shady border in peat soil. The American species should be covered with some dry straw in very severe frosts, or if there should be too much wet, they are not easily increased, but will sometimes perfect seeds in favorable situations, particularly if pains be taken to apply the pollen to the stigma." (*Bot Cult* 358.)

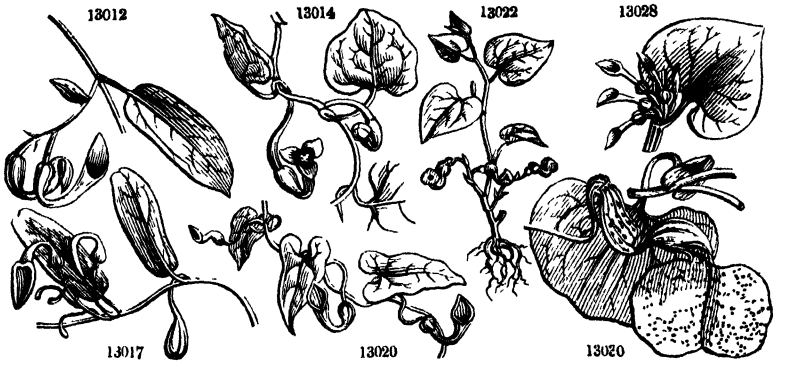
1932 *Stylidium* From στυλος, a column, in reference to the manner in which the stamen and style are united into one columnar mass Beautiful little New Holland plants with pink flowers, remarkable for the singular elasticity of their column, which, being touched with a pin, starts with violence from the side to which it was turned when stimulated The species grow in sandy loam and peat, and are increased by seeds, or dividing at the root, some of them by cuttings

1933. *Gunnera* So called after Ernest Gunner, bishop of Norway, who published a Flora of his country from 1766 to 1772. An uninteresting plant with orbicular leaves. May be planted in a pot of loam and peat, and plunged in water; it is increased by dividing at the root.

1934. *Aristolochia* From αριστος, excellent, and λοχος, a female in child-birth, the plant was considered formerly to possess considerable powers in aiding the expulsion of the placenta, and in exciting the lochial

DIANDRIA.

12997 Stem leafy, Lobe of column elliptical blunt, Lip shorter than sepals compressed
12998 Stem leafy, Lobe of column triangular acute, Lip shorter than sepals compressed
12999 Stem leafy, Lobe of column triangular oblong blunt, Lip shorter than sepals compressed
13000 Stem leafy, Lobe of column elliptical cordate blunt, Lip longer than blunt sepals, Spike in front
13001 Stem leafless 1-flowered, Leaves 2 radical oblong blunt, Scape scarcely longer than leaves
13002 Flowers with 5 sepals, Lip saccate spurred, Stem leafy
13003 Leaves distichous fleshy nerveless spotted, Scape little longer than leaves
13004 Leaves cartilaginous ligulate not spotted twice as short as the hairy scape



13005 Leaves linear toothletted at edge, Raceme spiked simple and scape glandular
13006 Leaves narrow linear decurrent smooth, Throat 4-crowned, Lip with an appendage
13007 Stem scandent, Leaves linear cirrhose, Throat crowned, Lip with an appendage, Column downy upwards
13008 Leaves setaceous linear sessile somewhat hairy, Orifice naked, Lip with an appendage

13009 Leaves linear, Spike subsessile divided: partial few-fl. Capsules adnate at base linear 1-celled

13010 Leaves reniform toothed shorter than the scape in fruit

HEXANDRIA.

13011 Leaves 3-lobed, Stem twining, Corollas cylindrical broken saccate at base, Lip cordate cuspidate
13012 Lvs obl acum 3-nerved, Stem twining, Peduncles many-flowered, Cor incurv Lip ovate mucronate

13014 Stem twining, Lvs stalked cord downy beneath, Pedunc sol without bractes, Tube of cor. twisted back
13015 Lvs cordate ovate, Stem twining, Pedunc 1-fl longer than leaf, Lip cordate lanceolate longer than cor
13016 Leaves cordate obl Stem twining, Cor straight limb spreading, Lip spatulate bearded at end
13017 Leaves elliptical blunt somewhat emarginate slightly cordate, Pedunc many-fl Cor erect
13018 Leaves roundish cordate acute, Stem twining, Peduncles about 3, Cor incurved, Lip ovate
13019 Leaves cordate ovate blunt glaucous beneath, Stem twining, Cor incurved, Lip ovate retuse
13020 Leaves cordate oblong acuminate, Stem prostrate flexuose somewhat climbing, Cor incurved
13021 Leaves cordate ovate retuse, Stem prostrate flexuose somewhat climbing, Cor erect, Lip lanc acute
13022 Leaves cordate oblong acuminate, Stem flexuous ascending, Pedunc radical, Lip of cor lanceolate
13023 Leaves cordate blunt, Stem weak, Flowers solitary, Bractes cordate stalked
13024 Lvs cordate ovate crenate scabrous netted beneath, Stem branched at base flexuose prostrate, Cor erect
13025 Lvs cordate ovate blunt subsess Stem nearly erect and simple, Pedunc sol. 1-fl Cor erect
13026 Lvs. cordate ovate blunt emarginate stalked, Stem flexuose nearly erect, Pedunc sol 1-fl Cor erect
13027 Lvs cordate ovate blunt downy stalked, Stem erect hairy, Pedunc sol 1-fl Cor. recurved
13028 Lvs roundish cordate bluntish stalked, Stem erect, Pedunc. 1-fl. heaped, Cor. erect
13029 Leaves cordate lanceolate, Stem erect shrubby
13030 Leaves reniform roundish cordate amplexicaul Corolla incurved at base saccate · 2-lipped in the middle
13031 Leaves cordate acuminate, Flowers in racemes, Capsules acutely hexangular

and Miscellaneous Particulars

discharge. The root of A serpentaria is said to be the substance which the Egyptian snake-jugglers chew, for the purpose of stupifying the snakes by the introduction of their saliva into the reptiles' mouths. A. clematitis (from κλημα, a young shoot of the vine, in allusion to its appearance) is a species which furnishes one of the roots employed in European medicine. It is stimulant, stomachic, and emmenagogue; use has been made of it for various purposes, as for paleness of the countenance, fistula, sarcoma, &c A. pistolochia is also employed for the same purposes It grows upon the dry stony places of Languedoc and Provence. It is used in cases of obstructed perspiration, and in disorders of the lungs The roots should be chosen of a plump texture, and a yellowish color. They should be newly dried, and possess an aromatic flavor and a bitter taste.

Aristolochia trilobata and odoratissima have strong smelling roots, which are looked upon in Jamaica as powerful medicines, and used as stomachics by the slaves The first species is called Contrayerva of the north side, from its growing in that part of the island; and the other Contrayerva of the south side, for a corresponding reason The root of A serpentaria retains a place in the Materia Medica The dried root is imported into this country from North America, it has an aromatic odor, not unlike that of Valerian, and a sharp, warm, bitter, pungent taste, resembling in some degree that of camphor. Medicinally, it is stimulating diaphoretic, and tonic.

Class XXI. — MONŒCIA.

Male and female organs in distinct flowers, but upon the same plant.

This class consists of a variety of plants of all kinds, natures, and affinities, combined by the character of having their flowers unisexual, but upon the same plant, in which respect Monœcia is distinguished from the next class, Dioecia It contains nearly all the most important timber-trees of the temperate countries of the world, such as the oak, the pine, the birch, the beech, the walnut, the plane, the cypress, and many others The bread-fruit, so important an article of food in some parts of the world, is placed in Monandria. Various palms occupy a station in other parts of the class. The dangerous Manchineel-tree, and many poisonous or medicinal plants, are also placed here To Monœcia Polyandria belongs the famous Upas-tree of Java, to which so many fables are attached It is described in Rumphius's Herbarium Amboinense (2 87), under the name of Ipo, and is now ascertained to be a species of Antiaris From Siphonia elastica, a plant of Monœcia Monadelphia, and native of Brazil, one of the kinds of Caoutchouc or gum elastic of commerce is obtained.

Sprengel, and others, refer most of the genera of Monœcia to other classes, considering those only to be truly referable to it, of which the male and female flowers have some differences of structure.

Order 1. MONANDRIA.  Stamen 1.

1935. *Artocarpus* Male A cylindrical catkin Cal O. Petals 2 Filament the length of cor. Female Cal O. Cor O Ovaries numerous, collected in a globe Style filiform. Drupe compound

1936 *Casuarina* Male Catkin filiform Calyx 2-valved Cor O. Female Catkin globose. Calyx an ovate scale Cor O Caps 2-valved, 1-seeded. Seed winged at end.

1937 *Ceratocarpus* Male. Cal 2-parted Cor O. Filament long Female. Calyx 1-leaved, 2-horned, attached to the superior ovary. Cor O Style 2. Seed 1, tightly enclosed in the calyx

1938 *Zannichellia* Barren fl Perianth. none. Fertile fl. Perianth. single of 1 leaf. Germens 4 or more Style 1. Stigma peltate. Capsules sessile

Order 2. DIANDRIA.  Stamens 2

1939 *Lemna.* Male. Cal 1-leaved. Cor O Female Calyx 1-leaved Cor O Style 1 Capsule 1-celled, 2-seeded.

1940. *Anguria.* Male. Calyx 5-fid. Petals 5 Female. Cal 5-fid. Petals 5. Fruit inferior, 2-celled, many-seeded

Order 3. TRIANDRIA.  Stamens 3.

1941 *Comptonia* Male A catkin Calyx a scale Petals 2. Filaments 2-forked. Female A catkin Calyx a scale Petals 6 Styles 2 Nut ovate

1942. *Hernandia* Male Calyx 3-parted Petals 3. Female Calyx truncate, entire. Petals 6. Drupe hollow, open at orifice, with a moveable kernel

1943 *Axyris* Male. Calyx 3-parted. Cor O Female Calyx 5-leaved Cor O Styles 2 Seed 1

1944. *Tragia.* Male Calyx 3-parted. Cor O Female Calyx 5-parted Cor O. Style 3-fid. Caps of 3 pieces, and 3 cells. Seed solitary

1945 *Typha* Flowers collected into cylindrical dense spikes or catkins Barren fl Perianth. O Stam 3 together, upon a chaffy or hairy receptacle, united below into 1 filament Fertile fl. Perianth O. Pericarp pedicellate, surrounded at the base with hairs resembling a pappus

1946 *Sparganium.* Flowers in spherical dense heads Barren fl Perianth single, of 3 leaves Fertile fl single, of 3 leaves Drupe dry, with 1 seed

1947. *Carex* Flowers collected into an imbricated catkin Barren fl Calyx of 1 scale, glumaceous Cor O Fertile fl. Calyx of 1 leaf, glumaceous. Cor of 1 leaf, urceolate, ventricose. Stigm 2-3. Nut triquetrous, included within the persistent cor

1948 *Cobresia* Flowers in an imbricated catkin Male Calyx a solitary scale Cor O. Female Cal generally a double scale, one flat, the other involving the ovary. Cor. O Stigmas 3. Nut somewhat three-cornered, naked.

1949. *Uncinia.* Flowers in an imbricated catkin, androgynous. Male Cal a solitary beardless scale Female Cal bearded, beard hooked from the base of the inside of scale Stigmas 3

1950. *Zea* Male in distinct spikes Cal a two-flowered blunt glume Cor a blunt glume Female Cal a 2-valved glume Cor a 2-valved glume Style 1, filiform, pendulous. Seeds solitary, immersed in an oblong receptacle

1951. *Coix.* Male in remote spikes Cal a 2-flowered blunt glume Cor a blunt glume Female Calyx a 2-flowered glume Cor a blunt glume Style 2-parted. Seed covered by the ossified calyx

1952. *Tripsacum.* Male. Glume 2-flowered: outer male, inner neuter Cor. a membranous glume. Female. Calyx a 1-fl. glume, surrounded by a 1-leaved involucrum, perforated at the recesses. Cor. a 2-valved glume Styles 2 Seed 1.

1953. *Heteropogon* Spike simple, monœcious. Flowers male on one side, female on the other Male Cal 2-valved. Cor 2-valved, beardless: the inner valve setaceous. Nectary 2-lobed, turgid. Female. Cal. two-valved. Cor 2-valved, one thickish and bearded. Beard very long and hairy

1954. *Oryza* Male Calyx a 1-flowered somewhat awned glume Cor O Female. Cal a 1-fl. spreading, ovate, awned glume. Cor. a 2-valved blunt glume. Style bifid. Seed cartilaginous.

Order 4. TETRANDRIA.  Stamens 4

1955. *Alnus.* Flowers collected into imbricated catkins. Barren fl. Scale of the catkin 3-lobed, with three flowers. Perianth. single, 4-partite. Fertile fl. Scale of the catkin subtrifid, with 2 flowers. Perianth. O Styles 2. Fruit compressed

1956. *Betula.* Barren flower in a cylindrical catkin, its scales 3-fl. Perianth O Stam. 10-12. Fertile fl. Scale of the catkin imperfectly 3-lobed, 3-flowered. Perianth. O. Styles 2 Germens compressed, 2-celled, one abortive. Nuts compressed, with a membranaceous margin, 1-seeded.

1957 *Buxus* Male Calyx 3-leaved Petals 2 Rudiment of an ovary Female Calyx 4-leaved. Petals 3 Styles 3 Caps with 3 beaks and 3 cells. Seeds 2.
1958 *Cicca* Male Calyx 4-leaved Cor O. Female. Cal. 4-leaved. Cor. O. Styles 4. Capsule 4-coccous, not splitting, somewhat fleshy
1959 *Morus.* Male. Cal. 4-parted. Cor O. Female. Calyx 4-leaved. Cor. O. Styles 2 Calyx berried. Seed 1.
1960 *Bœhmeria.* Male Cal 4-parted. Cor. O. Nut O Female Cal O Cor O Style 1. Seed 1.
1961 *Pilea* Male Cal 4-parted membranous. Stamens 4 elastic. Female Calyx 3-leaved, with one sepal fleshy and gibbous. Stigma sessile fringed.
1962 *Urtica* Barren fl Perianth single, of 4 leaves, containing the cup-shaped rudiment of a germen. Fertile fl. Perianth. single, of 2 leaves Pericarp 1-seeded, shining
1963 *Pachysandra.* Male. Calyx 4-leaved. Cor O Female Calyx 4-leaved. Cor. O. Styles 3. Caps. 3-horned, 3-celled Seeds 2.
1964 *Diotis.* Male Calyx 4-leaved. Cor. O Female. Calyx 1-leaved, 2-horned. Style 2-parted. Seed 1, villous at base, covered with the 2-horned calyx.
1965. *Empleurum* Male Calyx 4-fid. Cor O Female. Cal. 4-fid, inferior Cor O. Stigma cylindrical, seated on a lateral tooth of the ovary Caps splitting at side Seed 1, with an arillus
1966 *Aucuba* Male Cal 4-toothed Petals 4 Recept. with a square hole. Female Cal 4-toothed. Petals 4 Ovary inferior Style 1, short Nut ovate, 1-celled
1967. *Littorella* Barren fl Calyx of 4 leaves Cor 4-fid. Stam. very long. Fertile fl. Calyx O. Cor. unequally 3 cleft Style very long Nut 1.
1968 *Serpicula* Male Cal 4-toothed Petals 4 Female Cal 4-parted. Pericarp a downy nut
1969 *Maclura* Male A catkin Female Cal. O Corolla O Style 1, filiform, villous Ovaries numerous, coalescing into a compound globose berry of many cells, cells 1-seeded. Seed obovate, compressed.

Order 5 PENTANDRIA  Stamens 5

1970 *Exocarpus* Male Cal 5-leaved Cor O Stamens inserted in calyx Female Style simple, short. Stigma peltate Drupe 1-seeded, placed on a fleshy receptacle
1971 *Nephelium* Male. Cal. 5-toothed Cor O. Female Cal. 4-fid. Cor O Ovaries 2. Styles two to each Drupes 2, dry, muricated, 1-seeded
1972 *Schizandra.* Male Cal 9-leaved in a triple row Cor O Anthers subsessile, cohering at end. Female. Cal. of male Cor O Ovaries numerous, capitate Berries 1-seeded, inserted on a long filiform receptacle
1973 *Franzeria.* Male Cal common, 1-leaved, many-toothed Cor 1-petalous, tubular, 5-toothed. Recept naked Female Calyx many-leaved Cor O Styles 4 Drupe dry, 4-celled, setose
1974 *Xanthium* Male Common calyx imbricated Cor monopetalous, 5-fid, funnel-shaped. Female Cal a 2-leaved, 1-flowered involucrum Cor O Drupe dry, muricated, 2-fid Nut 2-celled
1975. *Amaranthus.* Male Cal 3-5-leaved Cor O Stamens 3-5 Female Cal of the male Cor O Styles 3 Caps 1-celled, cut round about
1976 *Luffa* Male Cal. 5-parted. Cor 5-parted, attached to calyx Female Cal and cor of male Filaments 5, sterile Ovary inferior Stigma clavate. Gourd with a lid, 3-celled, furrowed
1977 *Ambrosia* Male Common cal 1-leaved Cor 1-petalous, 5-fid, funnel-shaped. Recept. naked Female Cal 1-leaved, entire, 5-toothed beneath, 1-flowered Cor O Nut formed by the indurated calyx, 1-seeded
1978. *Securinega* Male Cal 5-parted Cor O. Stamens 5, inserted under a rudiment of a pistillum Female. Capsule 3-celled

Order 6 HEXANDRIA  Stamens 6.

1979 *Zizania* Male Cal O. Cor a 2-valved blunt glume, mixed with the females Female Cal O Cor a 2-valved glume, cucullate, and awned Style 2-parted. Seed 1, enveloped in the plaited corolla
1980 *Pharus* Male Cal a 2-valved 1-fl. glume Cor a 2-valved glume Female The cal of the male. Cor a long involute 2-valved glume. Seed 1
1981 *Guettarda* Male Cal cylindrical Cor 4-7-fid, funnel-shaped Female Cal cylindrical Cor. 4-7-fid. Ovary 1 Drupe dry
1982 *Sagus* Common spatha 1-valved Spadix branched Male Cal 3-leaved Cor O Filam dilated Female Cal 3-leaved, with two of the leaves bifid Cor O Style very short. Stigma simple. Nut tessellated-imbricated, 1-seeded
1983 *Cocos* Common spatha 1-valved Spadix branched Male. Cal 3-leaved. Cor. 3 petals. Female Cal. 2-leaved Cor 6 petals. Style O Stigma a depression Drupe fibrous
1984 *Elate* Common spatha 2-valved Spadix branched Male. Cal. 3-toothed Petals 3 Anthers sessile Female Cal 3-toothed Petals 3 Stigmas 3 A drupe
1985 *Bactris* Common spatha 1-valved. Spadix branched Male Cal 3-parted Cor 3-fid. Female Cal 3-toothed Cor 3-toothed Style very short. Stigma capitate Drupe fibrous, succulent.

Order 7 POLYANDRIA  Stamens more than 6.

1986 *Cratophyllum* Barren fl Cal. multipartite Cor. O Stam 16-20 Fertile fl Cal multipartite. Cor O. Stigma nearly sessile, oblique Nut 1-seeded
1987 *Myriophyllum.* Barren fl Cal of 4 leaves Petals 4 Stamens 8 Fertile fl Cal. of 4 leaves Petals 4 Stigmas 4, sessile. Nuts 4, subglobose, 1-seeded
1988 *Sagittaria* Male Cal 3-leaved. Petals 3 Stamens about 24. Female Cal 3-leaved. Petals 3. Ovaries many. Seeds many, naked.
1989. *Begonia* Male Cal O Petals 4: the two opposite the largest. Stamens numerous Female Cal. O. Petals 4 or 6, like the male Styles 3, bifid Caps inferior, 3-angular, winged, 3-celled, many-seeded.
1990 *Poterium* Barren fl Cal of 4 leaves. Cor 4-partite. Stamens 30-40 Fertile fl Cal of 4 leaves Cor 4-partite Germens 2. Fruit 2-celled, invested with the cal
1991 *Amurola* Male Calyx 5-fid lower segm cut down to the base. Cor. O Stamens 8, declinate. Female as in the male Style incurved Caps 3-coccous, inflated, 3-valved Seeds globose
1992. *Acidoton.* Male Cal. 5-leaved. Cor. O Stamens 35-40 Female. Cal. 6-leaved. Cor O Style 3-fid. Caps 3-coccous.
1993. *Thelygonum.* Male Cal 2-fid Cor. O. Stamens about 12. Female. Cal 2-fid. Cor. O. Ovary 1 Caps coriaceous, 1-celled, 1-seeded
1994 *Castanea.* Barren fl in a very long cylindrical catkin. Perianth. single, of 1-leaf, 6-cleft. Stamen 5-20 Fertile fl. 3, within a 4-lobed, thickly muricated involucrum. Perianth. single, urceolate, 5-6-lobed, having the rudiments of 12 stamens Germen incorp with the perianth. 6-celled, with the cells 2-seeded, 5 of them mostly abortive. Styles 6. Nut 1-2-seeded, invested with the enlarged involucre.

1995. *Ostrya.* Male, an imbricated catkin Cal a scale Cor O Filaments branched, Female, a naked catkin. Cal O. Cor O. Caps inflated, imbricated, 1-seeded at base.

1996. *Carpinus* Barren fl in a cylindrical catkin, its scales roundish ciliated at the base Stamens 8-20 Fertile fl. in a lax catkin, its scales large, foliaceous, 3-lobed, 1-flowered Invol. O. Perianth of 1 leaf, urceolate, 6-dentate, incorporated with the 2-celled germen, of which 1 cell is abortive. Styles 2. Nut ovate, striated, 1-seeded

1997 *Fagus* Barren fl in a globose catkin Perianth single, of 1 cut, campanulate, 6-cleft. Stamens 5-12. Fertile fl. 2, within a 4-lobed prickly involucre Perianth. single, urceolate, with 4-5 minute lobes Germen incorporated with the perianth, 3-celled, two of them becoming abortive Styles 3. Nuts 1-seeded, invested with the enlarged involucre.

1998 *Corylus* Barren fl in a cylindrical catkin, its scales 3-cleft. Perianth O Stamens 8 Anthers 1-celled. Fertile fl Perianth. obsolete Germens several, surrounded by a scaly involucre Stigmas 2 Nut 1-seeded, surrounded at the base with the enlarged united coriaceous scales of the involucre

1999 *Juglans* Male, an imbricated catkin Cal a scale Cor 6-parted. Filaments 4-18 Female. Cal. 4-fid, superior Cor 4-fid Styles 2. Drupe coriaceous, with a furrowed nut

2000 *Quercus* Barren fl in a lax catkin Perianth. single, somewhat 5-cleft. Stamens 5-10 Fertile fl Invol cup-shaped, scaly Perianth single, incorporated with the germen, 6-lobed. Germen 3-celled, 2 of them abortive Style 1. Stigmas 3 Nut (acorn) 1-celled, 1-seeded, surrounded at the base by the enlarged cup-shaped involucre.

2001 *Liquidambar* Male, a conical catkin, surrounded by a 4-leaved involucre. Cal O Cor O Filaments numerous Female, a globose catkin, surrounded by a 4-leaved involucrum Cal 1-leaved, urceolate, 2-flowered Cor O Styles 2 Capsules 2, surrounded at base by calyx, 1-celled, many-seeded

2002 *Platanus* Male, a globose catkin Cal O Cor scarcely any. Anthers growing about the filament. Female, a globose catkin Cal many leaved Cor O. Styles with a recurved stigma Seeds roundish, mucronate with the style, pappose at base.

2003 *Salisburia* Male, a naked catkin. Cal O Cor O Anthers imbricated. Female. Cal 4-fid Drupe with a 3-cornered nut

2004 *Cathdovica* Common spatha 4-leaved Spadix cylindrical Male Common calyx a cubical 4-flowered receptacle proper calyx many-toothed Female Cal an edge Styles 4, very long Stigmas anther-like. Berry cubical many-seeded

2005 *Caladium* Male Cal and cor O Anthers peltate, many-celled, disposed in a spike at the end of the spadix Female Cal and cor O Ovaries inserted at base of spadix Style O Berry 1-celled, many-seeded

2006 *Arum* Spatha of 1 leaf, convolute at the base Perianth O Spadix with germens at the base Stem (sessile) near the middle of the spadix, which is naked above Berry 1-celled, 1-seeded

2007 *Caryota* Common spatha compound. Male Cal 3-leaved. Petals 3 Female. Cal. 3-leaved. Cor 3-parted Style 1 Berry 1-celled, 2-seeded

Order 8 MONADELPHIA  Stamens united into a single body.

2008 *Nipa* Palm Male Cal O Petals 6. Filament 1, 12-fid Female Stigma a lateral furrow. Drupe angular, 1-seeded.

2009 *Areca* Common spatha 2-valved Male Cal 3-parted Petals 3 Stamens 6, cohering at base, Female Cal 3-leaved Petals 3 Nect 6 toothed Styles 3, very short Drupe 1-seeded.

2010 *Retis* Male Anthers 2-celled Female Scales imbricated in a lupuliform cone, very short, crested, bracteate at back, trigynous Lateral pericarps auricled, middle cuneate, deciduous with the cone

2011 *Agathis* Male Anthers many-celled Female Scales imbricated in a round cone, naked at back, persistent monogynous Pericarps winged, united to the inside of scale Cotyledons 2

2012 *Pinus* Male Anthers 2-celled Female Scales in a conical cone, bracteate at base, digynous Pericarps attached to the inside of scale, more or less winged, deciduous Stigmas 2-3 fid Cotyledons 4-8

2013 *Abies.* The same as Larix, excepting its habit and stigma, which is that of Pinus Cotyledons 3-9

2014 *Larix* Male Anthers 2-celled Female Scales imbricated in a round cone, bracteate at base, digynous Pericarps attached to inside of scale, winged, deciduous Stigma hemispherical, cupped, glandular. Cotyledons 5-9

History, Use, Propagation, Culture,

resembling that of the crumb of wheaten bread mixed with Jerusalem Artichoke The plant was first brought to England by the unfortunate Captain Bligh A fresh supply has been more than once received, and there are now a number of plants in the nurseries about London The bread-fruit, according to Sweet, is generally supposed to be difficult of cultivation in this country. He considers that the plants have been, in general, treated too tenderly, and not allowed sufficient air "They appear," he says, "to be of the same nature as the Fig, to which they are nearly allied Large cuttings root freely in a pot of sand, plunged under a hand-glass, in a moist heat, with all their leaves entire. If the leaves are shortened, it is a great chance if they succeed" (*Bot Cult* 19)

There are several varieties of the bread-fruit, as of all plants that have been long in cultivation The principal of these varieties are without seeds, the natives of Otaheite reckon at least eight, differing in the form of the leaf and fruit A integrifolia is also by many considered a variety of the other, for the leaves are sometimes lobed, and the situation of the fruit varies with the age of the tree, being first borne on the branches, then on the trunk, and finally on the roots

The bread-fruit is ripe in December, and is used boiled, or fried in Palm oil Besides the use of the fruit, the economical purposes to which the other parts of the tree are applied are various The wood is used in building boats and houses, a cloth is made of the inner bark, the male catkins serve for tinder, the leaves for wrapping up food, and for wiping the hands instead of towels, and the juice for making bird-lime, and a cement for filling up the cracks of vessels for holding water According to Forster, three trees are supposed to yield sufficient nourishment for one person.

The bread-fruit tree is distributed very extensively over the East Indian continent and islands, as well as the innumerable islands of the South Seas In 1793 it was introduced to the West Indies, and subsequently to different parts of South America Much has been said in praise of it by Europeans, and certainly, to the inhabitants of the South Sea Islands, it may be a valuable food, as the acorn was to the inhabitants of Britain, when they were in a certain state of civilization But whether a civilized and refined people would esteem this fruit for their own use as highly as they do for the use of the semi-barbarians of the South Seas, is a point which may reasonably be doubted

1936. *Casuarina.* The name under which the tree is described by Rumphius, who probably called it so from the resemblance its foliage bears to the plumage of the *casoar* or *cassowary* of the same country. By the Malays it is called *filao*, and by the South Sea Islanders *club-wood*, on account of the use of it for warlike weapons. Casuarina equisetifolia is a large spreading and lofty tree, with leaves, or rather branchlets, hanging down in bunches from twelve to eighteen inches in length, like a long head of hair, or a horse's tail, all jointed from top to bottom. The appearance of the whole tree is very remarkable. It was introduced by the first Lord Byron.

13034 Branchlets flaccid round, Scales of cones unarmed villous
13035 Dioecious, Branchlets erect furrowed, Scales of cones unarmed smoothish
13036 Dioecious, Branchlets ovate round, Scales of cones unarmed ciliated
13037 Dioecious, Branchlets flaccid, Scales of cones villous and rough with tubercles
13038 Dioecious, Young branches somewhat flaccid, Scales of cones villous, Male sheaths submultifid ciliated
13039 Branches erect, Scales of cones mucronate pubescent, in which it chiefly differs from C stricta
13040 Monoecious, Branchlets erect square, Scales of cones unarmed smooth

13041 Stem much branched diffuse making globose tufts

13042 Anthers 4-celled, Stigmas entire, Pericarps toothed on the back

DIANDRIA.

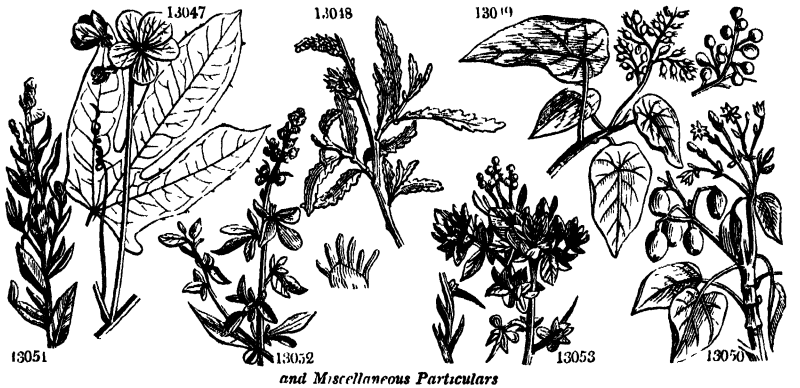
13044 Fronds nearly ovate compressed, Roots solitary
13045 Fronds obovate nearly plane above hemispherical beneath, Roots solitary
13046 Fronds obovate rotundate compressed, Roots numerous clustered



13047 Fruit small, Leaves 3-lobed

TRIANDRIA.

13048 Leaves oblong alternately sinuated

13049 Leaves peltate
13050 Leaves cordate ovate acuminate flat stalked at base

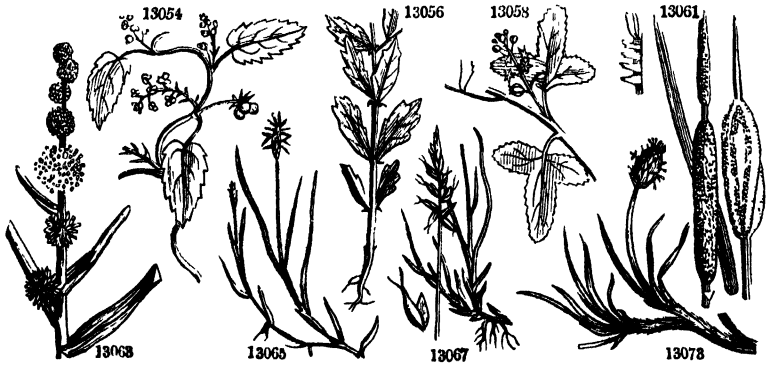
13051 Leaves ovate, Stem erect, Spikes simple
13052 Leaves ovate, Stem erect, Spikes panicled
13053 Leaves obovate, Stem somewhat divided, Flowers capitate

and Miscellaneous Particulars

1937. *Ceratocarpus* Named from κερας, a horn, and καρπος, fruit, because the seeds have two horns Useless weeds.

1938. *Zannichellia* So called in honor of John Jerome Zannichella, a Venetian apothecary, who died in 1729 He left behind him a few works of little consequence A plant found abundantly in the marshes of some parts of England

1939 *Lemna* Said to have been so called from λεπις, a scale, in allusion to the form of the plants Theophrastus describes under the same name an aquatic plant Annual weeds, which float on stagnant water, their flowers are very obscure, and not produced freely in northern climates L trisulca has dichotomous, filiform, divaricated stems, having a lanceolate leaf at the angle of the branches, but proliferous ones terminating the branches, where these leaves are conjoined, there shoots out a pendant radicle, with a conical papilla at its base. Linnæus observes, that the stems are flatted and proliferous, crossing each other, and thus resembling in the mode of growth the opuntia or Indian fig The leaves of L. minor are very small, of a roundish ovate form, collected into heaps by twos or threes, and forming extensive green plats on stagnant waters, each leaf drops a single radicle This plant affords nourishment not only to ducks, but to the fresh water polype, to Phalæna Lemnata, &c Its quick and extensive propagation makes it troublesome in some cases, but at the same time it is considered valuable as converting hydrogen gas into air adapted to respiration L. polyrhiza is distinguished by its dropping bundles of thick black fibres from the lower surface of the leaves. The plants sink in the water in the winter season, and either these or new ones appear again in the spring.



1940 *Angurıa* One of the Greek names for the Cucumber. The plant now so called is also a kind of gourd The species grow freely on light soil, and are propagated by seeds or roots.

1941. *Comptonia* Named in honor of Henry Compton, Lord Bishop of London, by whom the fine collection of plants attached to the episcopal palace at Fulham was formed. A handsome shrub, which thrives in peat soil, or sandy loam, and is increased by suckers or layers.

1942 *Hernandia.* So called in honor of Francisco Hernandez, a Spanish botanist, and first physician to Philip the second of Spain, by whom he was sent to Mexico for the sake of investigating the natural history of that country Linnæus is said to have named it in allusion to the large leaves and little flowers of the plant, which may be supposed to represent the great means and small advantages which attended the expedition of Hernandez This is an upright lofty tree, with an elegant head. The fruit is a nut, sustained and partly enveloped by a yellow persisting calyx The nuts are very large, and as they move in the wind, produce sound enough to alarm unwary travellers. In our stoves the plants grow freely in loamy soil, and ripened cuttings, with their leaves on, root in sand under a hand-glass.

1943. *Asyris* A word of unknown meaning Plants of little beauty and the easiest culture.

History, Use, Propagation, Culture,

1944. *Tragia.* In honor of a German botanist named Jerome Bock, born in 1498, and died in 1554; *Tragus,* which was the name he bore in science, being a Greek translation of his real name, both signifying a goat. He published a history of plants, or Kræuterbuch, and several other works Twining plants of no interest

1945. *Typha* From τυφος, a marsh, in which all the species naturally grow T latifolia is one of the handsomest aquatics of the reed kind, its leaves are of a bluish color, an inch in width, and three feet long, the pollen of the flower is very abundant, and a light being applied to it, a flash of fire is produced Haller says, that the roots are eaten in salads, that cattle eat the leaves, and that the downy seeds serve for stuffing pillows. The leaves are sometimes used by coopers, and introduced between the staves of their casks, they are frequently used for making mats, baskets, chair bottoms, and sometimes for thatch Rubens, and other

13054 Leaves cordate ovate acuminate serrated smoothish, Petioles ciliated, Female sepals hairy entire
13055 Leaves hispid ovate-acuminate serrated, Female sepals pinnatifid setose hispid
13056 Leaves lanceolate sessile blunt somewhat toothed at end, and stem, which is erect and branched, downy
13057 Leaves linear lanceolate stalked blunt mucronate, Stem branched diffuse
13058 Leaves deeply 3-lobed toothed, Middle lobe long

13059 Leaves linear nearly plane, Sterile and fertile catkins close together
13060 Leaves linear plane twice as short as culm, Male and female catkins remote
13061 Leaves linear convex below, Sterile and fertile catkins a little distant from each other

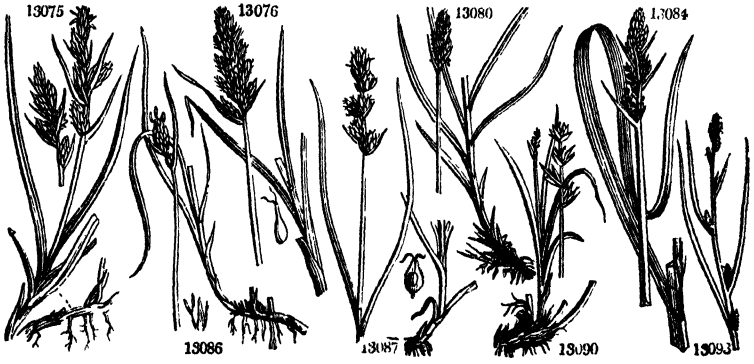
13062 Leaves triangular at the base their sides concave, Common flower-stalk branched, Stigma linear
13063 Leaves triangular at the base their sides plane, Common flower-stalk simple, Stigma linear
13064 Lvs floating plane, Common fl.-stalk simple, Stigma ovate very short, Head of sterile fls mostly solitary

§ *Spikes dœcious*

13065 Spike simple dœcious, Fruit ascending ovate shortly acuminated striated rough at the margin upwards
13066 Spike simple dœcious, Fruit ovate much acuminated recurvate-deflexed smoothish at the margin

§ 2 *Spikes androgynous*

* 1 *Spike simple*



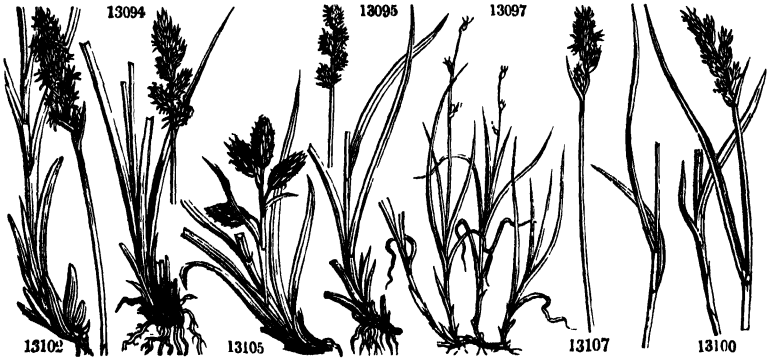
13067 Spike simple androgynous, Flowers few, Fruit distant oblongo-lanceolate acuminate reflexed, Stigmas 2
13068 Spike simple androgynous male at top, Stigmas 3, Fruit oblong with a short beak horizontal
13069 Spike simple androgynous of very few fls Fruit distant lanceolate subulate patenti-reflexed, Stigmas

* 2 *Spikelets capitate*

13070 Spikes androgynous male below collected in globose involucrated heads, Stigm 2, Fr lanc with 2 points
13071 Spikes androgynous male above collected in an oblong head, Stigm 2, Fr. ovate comp. nerved with 2 teeth
13072 Spikes androgynous male above collected in an ovate form, Stigm 2, Fr ov acumin Culm branched at base
13073 Spikl. ster. at extrem collected into a roundish head, Fruit broad rotund-ov short acum swell on both sides nearly entire at the point, Culm obt angular, Leaves channelled
13074 Spikes androgynous male above collected into an oval head, Stigm 2, Fruit ellipt. roundish acuminate bifid

* 3 *Spikelets spiked, many-flowered* [Culm triang. Lvs plane

13075 Lower spikel fert · upp ones ster all crowd Fr with membr marg Bract membranc low ones subfoli.
13076 Inferior and term spikelets fertile intermediate ones sterile, Fruit acutely margined, Culms triangular
13077 Spike androgynous comp Spikelets obl altern clust male above, Stigmas 2, Fr round ov edged 2 toothed
13078 Spike androgynous comp Spikelets ovate alternate clustered male below, Stigmas 2, Fr ovate 2-toothed
13079 Spike androg comp somew distich Spikel about 5 altern cun obl lanc male bel Stig. 2, Fr ov edg bifid
13080 Spikel ster at the base oval about 5 approxim Fruit as long as the cal ovato-acumin convex on one side, concave on the other, with a membranaceous margin bifid at the point
13081 Spike androg. comp Spikel 12 altern ellipt blunt approxim, male below, Stigms 2, Fr ov lanc edg bicusp
13082 Spike androgynous comp Spikel about 5 altern ellipt blunt somewhat approxim male below, Stigmas 2, Fruit ovate lanceolate edged bicuspidate
13083 Spike androgynous comp. Spikel numer collected in 3s or 5s ovate clustered male above, Stigmas 2, Fruit spreading ovate acuminate 2-toothed edged compressed
13084 Spikel ster at their extremities three comp collected into a cylind crowded spike, Fruit ovate acuminat. convexo-plane acutang.-diverg Stem very acute triang Leaves rather broad
13085 Spike androg comp Spikel about 5 obl male above clust Stigm 2 Fr spread ov acum with 2 points nerv.
13086 Spikel ster at their extremities crowded into a somewhat ovate head lower ones with a leafy erect bractea at their base, Fruit roundish ovate convex on one side slightly concave on the other
13087 Spikel ster at their extremities subcomp collected into a rather long more or less interrupted spike, Fruit convexo-plano ovato-acuminate acutangular divergent rough at the margin upward
13088 Spike androg comp Spikel 4 altern obl male below somewhat approxim Stigmas 2, Fr obl acutish compr
13089 Spike long somew decompound branched at the base lower spikelets remote, Fruit erect smooth at edge
13090 Spikel ster at base 3 or 4 dist Fr ov much attenuat convexo-plane acutangul divaricat rough at margins
13091 Spike androg comp Spikel about 4 remote male above, Stigm 2, Fr ov acum 2-tooth horiz. ciliat at base
13092 Spikes subternate remote sessile, Bractes long, Fruit bifid at end
13093 Spikel. ster at base dist. Fruit longer than cal obl-ovate acuminate convexo-plane subacutang obtuse at the marg the point bifid, Bract very narr reaching beyond the culm



and Miscellaneous Particulars

Italian painters after him, have put it into the hand of Christ as a sceptre, when he was saluted as a king in mockery by Herod's soldiers The plant appears to be a native of every part of the world, in ponds, ditches, and by the sides of rivers and brooks

1946. *Sparganium* From σπαργανον, a band, in reference to the long ribbon-like leaves of the plants Sparganium ramosum is the commonest species it has a strong creeping root, and soon fills up a ditch or pond, if suffered to remain unmolested. It is common not only in Europe, but in Barbary, Siberia, and North America.

1947 *Carex*. From the Latin *carere*, to want. The upper spikes of these plants are constantly without seeds, consisting only of male flowers This numerous family of plants grow mostly in wet swampy grounds,

History, Use, Propagation, Culture,

extreme rigour of his climate C remota is a very elegant plant C paniculata grows in bogs in immense tufts, making a firm support for the heaviest bodies C Fraseri is the handsomest species of the genus, resembling at a short distance when in flower, one of the Liliaceæ C riparia has leaves half an inch wide, and from one to three feet long, in Italy the leaves are used by the glass-makers to bind their wine flasks, by the chair-makers to bottom chairs, and by the coopers to place in the junctures in the heads of casks, in the same manner as the leaves of the Typha are used in the same country, and the stalks of Scirpus lacustris in England C. arenaria increases rapidly in loose sand, and is sometimes planted with a view of fixing soils of this description, along with Elymus and Arundo

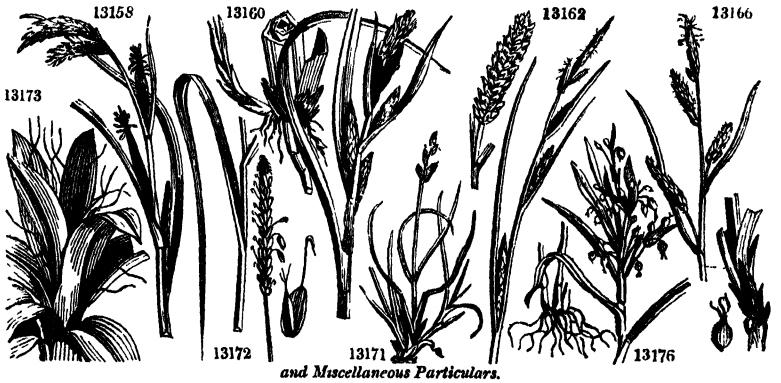
1948 *Cobresia.* Named by Willdenow, after a German nobleman of the name of De Kobres, who is said to have been a great promoter of natural history The plants resemble Carex.

13135 Male spike sol Scales obl. with very long beaks: female cylind. 2, stalk of the lower exserted, Stigm. 3, Fr. ovate inflated 5-nerved beaked
13136 Male spike sol. · fem 2 obl. close; low. stalk Stigm 3, Fr ellipt. glob. shin. bifid at end larg than ov scale
13137 Male spike sol.. fem. 3-rem , lower stalk Stigm. 3, Fr ov. nerv memb. at mouth long than mucron. scale
13138 Male spike sol . fem 3 few-fl 2 close sessile; lower rad. on a very long stalk, Stigm 3, Fr obov obl. 3-cornered with a very short beak
13139 Sheaths none, Bracteas foliaceous auric. at base, Spikes sess obl or subcylind obt Fruit broadly elliptical
13140 Fertile spikes nearly sessile cylindric. filif acumin Fr ovate somewhat acute plane above on each side, Culm acutely angular straight
13141 Fert. spikes cylind very long droop Fr ov short acum bif. at extremity closely imbricated, Leaves broad
13142 Digynous, Sheaths none, Spikes ovate. upper sessile, Leaves somewhat recurved rigid, Fruit compressed

* 3. *Male spike solitary, female all stalked*

13143 Fert. spikes few-fl lax drooping, Fr as long as ovate membranac decid scales oblongo-ovate acuminate
13144 Fert. spikes pedunculated oblongo-cylind subpendul Bract subfoliac Fruit ov.-ellipt. tumid obt glabrous
13145 Sheaths elongated shorter than the flower-stalk, Fruit elliptical ovate beaked (black) bifid at the point
13146 Fert spikes narrow obl very few-fl lax pendul Bract. subsetaceous, Scales acute longer and broader than the fruit, Fruit ovate somewhat acumin striated
13147 Fert spikes oblongo-ovate pendulous, Bracteas subsetaceous, Scales acute as long as the fruit, Fruit ellipt rotundate striated shortly mucronate
13148 Fertile spikes upon long footstalks cylind pendul Bract very leafy, Scales setaceous, Fruit oblong very much acuminate cloven at the tips striated
13149 Male spike sol fem about 4 remote filiform stalked cernuous, Stigm 3, Fr dist altern. obl beaked bifid
13150 Fert. spikes filif rather slender slightly drooping, Fr broadly ov much acumin cleft at point, Lvs narrow
13151 Male spike solit . fem usually twin stalk filif Stigm 3, Fr lanc hisp. scabr 2-toothed long. than obl scale
13152 Fert. spikes slend filif nearly erect, Fruit ov.-lanc nerved slightly recurv loose imbric. Lvs. rather broad

* 4 *Male spikes more than one*



13153 Fertile spikes subcylindrical drooping, Fruit obovato-globose obtuse rather downy entire at the point
13154 Male spikes twin fem twin obl sess rem Stigm 3, Fr ov nerved forked ventric larg than ov lanc scale
13155 Male spikes 3 fem twin on short stalks nodd cylind Stigmas 3, Fr ellipt ventricose with a short ent beak
13156 Fert spikes short peduncul oblongo-cylind their cal subcusp Fr ov short beak bif at point very pubes
13157 Lvs subsessile subhn thickened, Stigmas 2, Fr ellipt with short beak ent at end as long as rounded scales
13158 Fert spikes long cylind acum slender erect when in fruit, Fr oval swelling subacum entire at point, Culm acutely angular scabrous
13159 Scal of sterile spike obtuse, Fertile spikes cylind obtuse, Fruit oblongo-ovate acute bifid at point striated
13160 Foliaceous, Scal. of sterile spike acum Fertile spikes scarcely peduncul broadly cylindrical acute, Fruit ovate subacum bifid at the point
13161 Fert spikes cylind slightly droop Scal lanc Fr broadly ovate inflat subulato-rostrate deeply bifid at point
13162 Fert spikes cylind long near erect, Scal lanc Fr crowd subglob. inflat setaceo-rost. slightly bif at point
13163 Male spikes 2 female 3 obl remote subsessile, Stigmas 3, Fr obl compr rostr bifid ciliate serrat. at edge
13164 Male spikes 2 female 3 obl remote subsessile, lower subrad Stigmas 3, Fr ovate comp. 2-toothed hairy
13165 Bracteas long foliac Fertile spikes short cylind distant their scal cuspidate, Fr ov with long beak hairy
13166 Fert spikes droop cylind all the scal acum or mucr Fr ov triang with rather long acum beak bif at point
13167 Male spikes twin fem 4 dist stalk pendul cylind Stigm 2, Fr round ellipt ventric with very short beak
13168 Male spikes 2 fem 2 rem on very long stalks erect obl Stigm 2, Fruit ellipt with short beaks ent at end
13169 Male spikes about 4 female 2 erect stalked cylind Stigmas 3, Fr obov obt shorter than obl blunt scale
13170 Male spikes 3, female 2 cylindr stalked erect, Stigm 3, Fr ov glob beaked with 2 forks, Beaks hispid

13171 Spikes 3 or 4 alternate male above

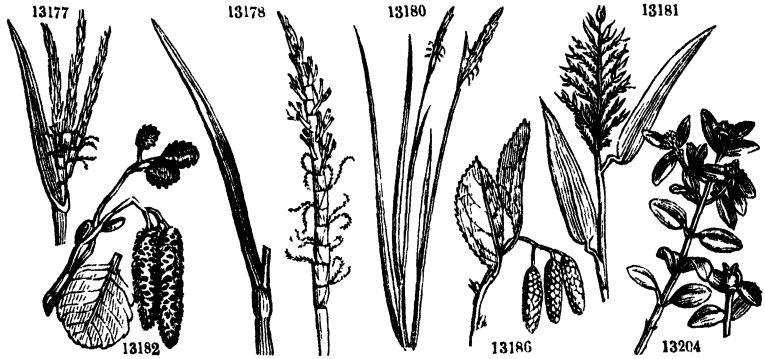
13172 Fruit oblong 3-cornered smooth at edge

13173 Leaves entire
13174 Leaves serrated

13175 Culm half round at top and obtuse, Flowers naked, Fruit ovate
13176 Culm round, Flowers naked, Fruit nearly round

and Miscellaneous Particulars.

1949 *Uncinia.* So called from *ογκος*, a hook, in allusion to the hooked awn, which in the fruit becomes hardened Plants with the habit of Carex



1950 *Zea.* The Greek name of corn of some kind. It is derived from *ζαω*, to live, and applied to this nutritive plant with propriety. The word *Maize* is the denomination of the vegetable among the South Americans Zea Curagua is the curious Valparaiso corn, to which a sort of religious reputation is attached, on account of the grains, when roasted, splitting regularly into the form of a cross. Of the well known Indian corn, Z Mays, there are numerous varieties, some of which are sufficiently hardy to thrive in this climate

1951 *Coix* A name used by Theophrastus to designate a kind of grass. C. Lachryma, commonly called Job's tears, derives its name from the appearance of its shining pearly fruit, which, when suspended on its slender pedicels, resembles in no inconsiderable degree a falling tear. Tropical grasses, which flower and seed plentifully in rich light soil

History, Use, Propagation, Culture,

1952 *Trípsacum* So called by Linnæus, from τριβω, to bruise or crush, in allusion to the purpose to which its grain may be applied Forage grasses of the West Indies

1953 *Heteropogon* From ἑτερος, various, and πωγων, a beard, in allusion to the various kinds of awns with which the flowers are furnished

1954 *Olyra* A name under which Homer speaks of a grain which was used as the food of horses, and which has been thought analogous to Barley The plant now so called is a native of America, and has no resemblance to that of the ancients

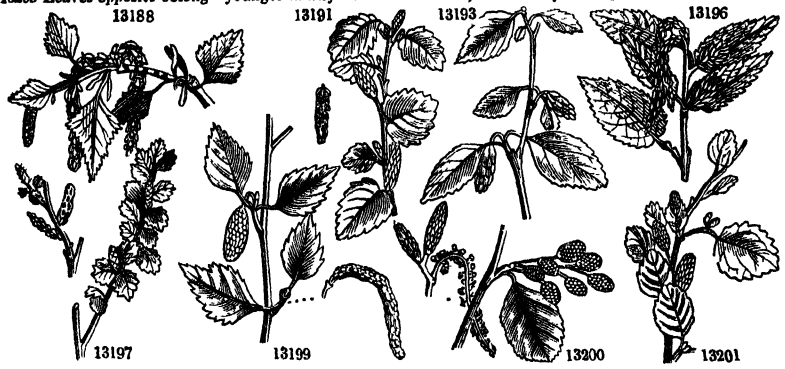
1955 *Alnus* From the Celtic word *al*, near, and *lan*, the edge of a river, in reference to the places where the species grow A glutinosa, *Aulne*, Fr, *Elter*, Ger, and *Alno*, Ital, is a well known timber tree, which will grow in marshy situations The timber is applied to a variety of purposes, and in general for all works intended to be constantly under water, for turnery and furniture The bark is used by dyers and tanners, the sap being of a yellow color and very astringent There is a variety with cut leaves sold by the nurserymen as an ornamental tree, though it is more curious than showy

1956 *Betula.* *Betu* is the Celtic word for the Birch *Bouleau*, Fr, *Birchenbaum*, Ger, and *Betulla*, Ital B pendula is the most graceful tree of the genus, it grows both in mountainous situations and bogs, from Lapland to the subalpine parts of Italy and Asia. B. lenta, the mahogany birch, mountain mahogany, or cherry birch of Canada, abounds in the middle states of Pennsylvania, New York, and the Jerseys; but disappears altogether in the higher latitudes of the northern states. It is thought a very fit tree for planting in the valleys of the mountainous districts of Britain Its growth is rapid, and the timber is close grained, beautifully variegated, and well adapted for cabinet work The leaves, which appear early in spring, possess

13177 Spikes 3 clustered · male above, female below
13178 Spike solitary: male above, female below
13179 Spike solitary hermaphrodite flexuose, Spikelets somewhat distant

13180 Culm nearly simple, Sheath of leaves bearded at edge, Spike smooth

13181 Culm branched, Panicle terminal



TETRANDRIA.

and Miscellaneous Particulars

a peculiar fragrance, which they retain after being dried in a stove, affording by infusion an agreeable diluent, superior to some of the common teas of commerce.

B populifolia and papyracea are elegant rapid growing trees, well deserving culture for their timber. All the species are ornamental, and more or less fragrant, and B. pumila and nana are pretty little shrubs. Of the Betula papyracea the North American Indians construct their large portable canoes, from which circumstance that species is known by the name of canoe birch Betula lenta is the most interesting of the genus, on account of the excellence of its wood It is known by the names of mountain mahogany, black birch, cherry birch, and sweet birch This last appellation it has from the sweet scent the branchlets give when bruised.

1957 *Buxus* An alteration of *πυξος*, its Greek name. B. sempervirens, *Buis*, Fr., *Buchsbaum*, Ger., and *Bosso*, Ital is one of the most useful of evergreen shrubs, edgings of the dwarf variety are of universal use in the walled gardens of Europe, and what is called the tree box is not less valuable as an evergreen shrub, which will grow under the shade and drip of trees The box is a native of most parts of Europe, from Britain southwards, and is very abundant in different parts of France and Switzerland. It abounds in many countries of Asia, as about Mount Caucacus, in Persia, China, Cochin China, and America. It was formerly very common in England, but has gradually disappeared as agriculture extended Box-Hill in Surrey, Boxley in Kent, and Boxwell in Gloucestershire, are named from their abounding in this tree. The timber of the box tree is of considerable value. It is sold by weight, and being very hard and smooth, and not apt to warp, is very well adapted to a variety of nicer works It is as extensively employed now as it appears to have been in the days of Evelyn, "for the turner, engraver, carver, mathematical instrument maker, comb and pipe or

History, Use, Propagation, Culture,

flute maker; and the roots for the inlayer, and cabinet maker Of box are made wheels and shivers, pins, pegs for musical instruments, nut-crackers, button-moulds, weavers' shuttles, bollar-sticks, bumpsticks, and dressers for the shoemaker, rulers, rolling-pins, pestles, mall-balls, beetles, tops, tables, chessmen, screws, bobbins for bone-lace, spoons, knife-handles, but especially combs "

The English wood is esteemed inferior to that which comes from the Levant, and the American box is said to be preferable to ours, for most purposes, but the English is superior for the purpose of the engraver.

The ancients made combs of box, and musical instruments to be played upon by the mouth The Romans likewise clipped it into form, for which nothing, says Pliny, is more fit And Martial mentions clipped box trees in the gardens at Bassus's country-house

The tree box was second to the yew with us in former times for the purpose of being clipped into the shape of animals, &c ; but the dwarf box stood unrivalled " for bordering up a knot, and was esteemed a marvellous fine ornament to the flower garden "

The branches were in request among our ancestors for decking up houses, they are still seen among other evergreens in churches at Christmas, and in some countries they are borne by attendants at funerals

Box has been much celebrated as a medicine in the venereal disease, colicks, intermittent fevers, and even madness According to Dr Blaine, it is the principal ingredient in Well's Watford Drink, which is given as a preventive to canine madness

Pliny affirms, that no animal will touch the seed of box Gmelin relates, that the branches are fatal to the camels that eat them None of our animals seem to touch this tree Corsican honey was supposed by the ancients to owe its infamy to the bees feeding on the box

1958 *Cicca* A word of unknown meaning Cicca disticha thrives in light loamy soil, and is increased by cuttings with their leaves on, planted in sand, and covered with a hand-glass

1959 *Morus* Μορέα was the Greek name of the Mulberry; it is derived from the Celtic *mor*, which signifies black *Murier*, Fr, *Maulbeerbaum*, Ger, and *Moro*, Ital M. alba is commonly cultivated in France and other countries for its leaves, to feed silk-worms, though in some parts of Spain and in Persia they are said to prefer the black mulberry. In China, it appears that both sorts are grown for the same purpose. The most valuable variety of M alba is one grown in Italy, and especially in Lombardy, with vigorous shoots, and much larger leaves than the other A number of plants of this variety have been lately imported for the purpose of making a plantation in the south of Ireland, with a view to try the growth of silk in that country. In France the white mulberry is grown as pollard elms are in England, in Lombardy it is grown exactly in the same way as we grow willows for baskets, and in similar soil, in China it is also grown in moist loamy soil, and both there and in the East Indies as low bushes, and the plantation rooted up and renewed every three or four years In many parts of the continent, when the leaves are wanted for the worms, they are stript off the young shoots, which are left naked on the tree, in other places the shoots are cut off, which is not so injurious to the tree, while the points of the shoots, as well as the leaves, are eaten by the worms. The plants are sometimes raised by seed, but more commonly by layers, the Italian variety is frequently grafted on seedling stocks of the common sort, in order to preserve it from degenerating In the East Indies, the plants are raised from cuttings, three or four of which are placed together where they are finally to remain. (*Encyc. of Agr.* 884.)

The fruit of the white mulberry is white, and less acid than that of the black species

M. nigra is naturally a stronger tree than the other, the fruit is of a dark blackish red, and of an agreeable aromatic and acid flavor. It has a place in the Materia Medica, as cooling and laxative, allaying thirst, and being grateful in febrile diseases Young trees, like most others of the Monœcious class, often produce

13206 Leaflets oblong, Racemes lateral

13207 Leaves deeply cordate unequal at the base ovate lobed unequally serrated smoothish

13223 Leaves opposite ovate pointed copiously serrated, Stipulas elliptical entire glauc. Corymbs much branched axillary longer than the footstalks

and Miscellaneous Particulars

only male blossoms for many years after they are planted, and yet afterwards become fruitful As the tree increases in age, it increases in fruitfulness, and in full grown trees the fruit is much larger and better flavored than in young ones In some of the old gardens near London, there are mulberry trees of a great age, which are very healthy and fruitful Bradley says, that most of these were planted in the times of James I, who attempted unsuccessfully to set up a silk manufacture in England. The fruit of the mulberry, like that of the strawberry and raspberry, is said not to undergo the acetous fermentation in the stomach, and therefore it may be safely eaten by gouty and rheumatic persons It is a mistake, however, to suppose that these fruits are lighter than others which have not the same antifermentative qualities

The mulberry is generally propagated by layers, but it may also be increased by seeds, cuttings, or grafting. It is generally grown as a standard in orchards; but will produce fruit sooner as an espalier or wall tree

M rubra has black shoots, rougher leaves than the black mulberry, and a dark reddish fruit, longer than the common sort, and of a very pleasant taste The tree is cultivated in China for feeding silk-worms, but not so generally as the white mulberry M indica is also cultivated for the same purpose. M tatarica bears pale red berries of an insipid taste, but eaten in Russia fresh, conserved, or dried, a wine and a spirit are also made from them, and the leaves are used for feeding silk-worms

M tinctoria is a tall branching tree, with a fine head, smooth leaves, and awl-shaped solitary spines The whole plant abounds in a slightly glutinous milk of a sulphureous color The timber is yellow, and a good deal used in dying that color, for which it is chiefly imported into Europe, under the name of Fustick-wood The berries are sweet and wholesome, but not much eaten, excepting by birds

All the species of Morus are remarkable for putting out their leaves late, so that when they appear, gardeners may safely set out their greenhouse plants, taking it for granted, that all danger from frost is over.

1960 *Bæhmeria* Named after George Rudolph Bohmer, a German botanist, and a member of the academy of Wittemberg He published several works, besides an academical dissertation upon the cellular tissue of vegetables Plants of little beauty, and easy cultivation and propagation

1961 *Pilea* So called by Mr Lindley, from *πίλος*, a cap, in allusion to the nature of one of the divisions of the perianthium A neat little creeping plant, which makes a good cover to hide the earth of large pots of tropical plants.

1962 *Urtica* A word formed from *uro*, to burn, in allusion to the stinging properties of most of the species. The English term *Nettle* seems to be the Anglo-Saxon *Netel*, which is itself an alteration of *nædl*, a needle, in the same language U dioica grows all over Europe, in Barbary, Siberia, and Japan, in hedges, neglected fields, gardens, and pastures This species, U urens, and pilulifera, with one or two others, are furnished with stings The small projecting bristles or prickles with which they are covered are tubular, and stand on a bag filled with a poisonous juice, they are perforated at the point, and when they are gently pressed vertically, the pressure at once forces the poison to ascend the tube, and enables the point to lodge it in the skin The tops of the tender shoots of U dioica are sometimes used as a pot herb early in spring, and they have even been forced for that purpose. A strong decoction of the plant salted, will coagulate milk very readily and without any disagreeable flavor The stalk is found to have a texture somewhat like that of hemp, and to be capable of being manufactured into cloth, ropes, and paper The leaves are the only food of the caterpillars of three of our most beautiful butterflies, Atalanta, Paphia, and Urticæ, the principal food of the Io, and the occasional food of the Comma album, the caterpillars also of the urticata and verticalis moths feed on it · a great number of other indiscriminate feeders devour its foliage, and the bases of the leaves in autumn are frequently disfigured by tubercles, which contain small maggots, probably producing Musca Urticæ. As a remedy for the

History, Use, Propagation, Culture,

sting of the nettle, its own juice, or that of the dock, may be applied. The exotic species are of easy culture.

1963 *Pachysandra* From παχυς, thick, and ανηρ ανδρος, signifying, in botanical language, a stamen; the stamens are very stout. A plant of easy culture in common light soil, and freely increased by suckers from the roots

1964 *Diotis.* From δις, double, and ους ωτος, an ear, on account of the two appendages which exist at the base of the florets A shrub of no great beauty, which thrives in light soil, and is easily increased by layers or cuttings under a hand-glass

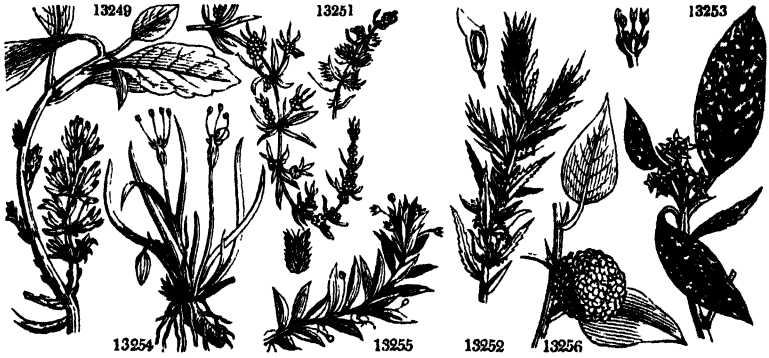
1965. *Empleurum.* From ευ, in, and πλευρον, the pleura, or membrane which envelopes the lungs The seeds of this plant are attached to a sort of coriaceous membrane

1966. *Aucuba.* The Japanese name of the plant. It is a well known laurel-like evergreen shrub, with leaves mottled with yellow Female flowers only have been produced in the gardens, but according to Kœmpfer,

13224 Leaves opposite elliptic-oblong acute serrated towards the point reticulated beneath, Stipulas ovate-entire, Clusters panicled about the length of the footstalks
13225 Leaves opposite elliptical acute serrated triple-ribbed their veins hairy, Stipulas roundish permanent, Clusters slightly branched, Stem shrubby shaggy with rusty hairs
13226 Leaves opposite elliptical with about 5 ribs, Clusters of flowers nearly simple
13227 Leaves ovate acuminate cordate at the base, Clusters of flowers much branched in pairs mostly dœcious
13228 Leaves opposite broadly ovate somewhat heart-shaped coarsely serrated, Fls. monœcious · male in twin upright unbranched stalked spikes with winged recept. : fem in nearly sess spikes shorter than footst.
13229 Leaves opposite ovate obl acute 3-ribbed serrated thickish reticulated and pale beneath, Corymbs stalked forked longer than the leaves, Flowers tufted
13230 Stem petioles and lvs. covered with rigid dense stimuli, Lvs. ov acum. doubly serrat. Spikes comp. whorled
13231 Leaves opposite in three deep pinnatifid segments, Clusters cylindrical in pairs erect
13232 Leaves opposite elliptical serrated 3-ribbed rugged, Clusters short dense terminal, Stem simple erect
13233 Lvs chiefly term opposite ellipt.-lanc pointed 3 ribbed entire nearly smth Stem angul. leafl. below, Cluster lateral dœcious
13234 Leaves opposite ovato-lanc. serr. heart-shaped at the base, Stem and footstalks hispid, Flowers dœcious, Clusters in pairs somewhat branched about as long as the footstalks
13235 Leaves opposite ovato-lanc entire, Stem much branched, Flowers dœcious
13236 Leaves opposite ellipt. 3-ribbed crenate fringed acute at each end entire at the base, Stem divaricated, Flowers aggregate on axillary stalks about the length of the footstalks
13237 Leaves long lanc. very rugose. glabrous above, beneath having a fine white down
13238 Stem downy roughish, Lvs on long stalks ov acute crenat downy roughish 3-nerv Stip lanc acute scar
13239 Lvs alternate ov serrat. minutely heart-shap at the base, Clusters axill forked, Fruit in orbicular corymbs
13240 Lvs. alternate ovate somewhat hairy serrated, Stipulas obtuse, Clusters axill compound spreading shorter than the leaves the lower ones male sessile, upper female stalked
13241 Leaves alternate roundish-ovate pointed toothed 3-ribbed snow white and downy beneath, Clusters axill repeatedly compound, Fl fasciculate
13242 Leaves alternate heart-shaped toothed prickly as well as the shrubby stem, Calyx of the fruit pulpy
13243 Leaves altern heart-shaped acutely crenate rough above soft and downy beneath, Panicles lateral leafless forked divaricated, Flowers capitate dœcious, Stem arborcous
13244 Leaves on long stalks cordate acuminate acutely serrated stinging, Spikes panicled
13245 Leaves stalked cordate acuminate serrated stinging, Racemes axillary
13246 Leaves cordate entire and 3-lobed coarsely tooth-serrated, Petiolcs and stem with long strigose prickles
13247 Stem with very long stimuli, Leaves pinnatifid with finely toothed segments, Spikes axillary compound
13248 Stem downy, Leaves on long stalks ovate-lanceolate acuminate subcrenate rough above soft beneath

13249 Stem procumbent, Leaves short oval crenate toothed above, Calyx minutely ciliated
13250 Leaves ovate lanceolate acuminated nerved

13251 Leaves lanceolate downy, Female flowers woolly



13252 Leaves lanceolate ensate crenate smooth, Capsules 1-celled

13253 The only species

13254 The only species

13255 Flowers tetrandrous, Leaves alternate linear lanceolate entire rough

13256 A small lactescent tree with alternate entire leaves and spiny branches

and Miscellaneous Particulars.

the fruit is a red oblong drupe, like a laurel berry, with a white sweetish pulp, and a kernel with a bitter taste.

1967. *Littorella* From *littus*, the shore, in allusion to the places where it grows. A pretty little delicate plant, with long tremulous white stamens.

1968. *Serpicula.* From *serpo*, to creep, on account of the habits of the species.

1969. *Maclura.* Dedicated by Nuttall, to William Maclure, Esq. of the United States, a philosopher, whose devotion to natural history, and particularly to the geology of North America, has scarcely been exceeded by Ramond or Saussure in Europe. A spreading deciduous tree, about twenty or thirty feet high, with a yellow axillary berry the size of an orange, but not so succulent, and said to be as agreeable when fully ripe. It was originally found by Hunter and Dunbar, on the banks of the Little Missouri or Washita river, also near Natchitoches, and upon the banks of the Arkansa.

History, Use, Propagation, Culture,

1970 *Exocarpus* So called from ἐξω, outside, and καρπος, fruit, because the nut appears to be seated on the outside of the pericarp, on account of the great receptacle on which it is placed.

1971. *Nephelium.* According to Dodoens, *Nephelion* was a name anciently given to the Burdock. The modern plant bears bristly fruit like the involucrum of the Burdock It is an excellent fruit, known in the islands of the Indian Archipelago by the name of Rambutan; grows in rich light loam, and is struck in pots of sand under a glass

1972. *Schizandra.* From σχιζω, to cut, and ανηρ, a stamen, its stamens are split A handsome plant, which grows in light loam and peat, and ripened cuttings root in sand under a hand-glass.

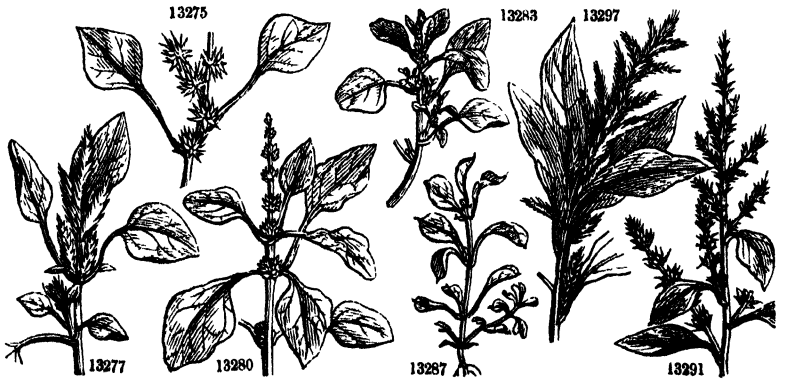
PENTANDRIA.

13257 The only species

13258 Leaves alternate pinnated, Racemes erect shorter than leaves

13259 Leaves lanceolate oval acute at each end end, rarely somewhat toothed

13260 Leaves bipinnatifid toothed, Petioles winged
13261 Leaves ovate-lanceolate cordate toothed, Petioles with an appendage



13262 Stem unarmed, Leaves cordate 3-nerved
13263 Stem unarmed, Leaves cuneiform ovate somewhat 3-lobed
13264 Spines ternate, Leaves 3-lobed
13265 Stem unarmed, Fruit oval aculeate, Prickles hooked echinate at base

1. *Triandrous.*

13266 Clusters axillary, Leaves linear-lanceolate cuneate retuse, Stem branched diffuse
13267 Clusters axillary, Leaves linear-lanceolate acute mucronate, Stem branched erect
13268 Clusters axillary, Leaves obovate retuse, Stem square simple

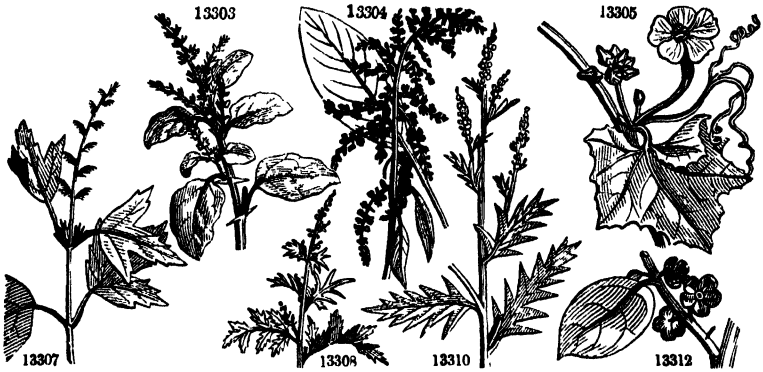
13295 Racemes supradecompound erect clustered, Branches downy, Leaves ovate wavy
13296 Racemes compound erect, Leaves ovate blunt mucronate
13297 Racemes compound nodding, Leaves ovate lanceolate
13298 Racemes compound nodding, Leaves lanceolate
13299 Racemes compound erect clustered, Leaves oblong lanceolate mucronate
13300 Racemes decompound naked spreading, Leaves lanceolate ovate
13301 Racemes simply spiked, Flowers axillary clustered, Leaves ovate acute
13302 Racemes decompound pendulous, Leaves lanceolate ovate, Stem nodding

and Miscellaneous Particulars.

1973. *Franzeria.* A genus dedicated by Cavanilles to Antony Franzer, a botanical physician, whose merits are forgotten. Cuttings root in loam and peat under a hand-glass.



1974. *Xanthium.* From ξανθος, yellow, a color which it is asserted by Dioscorides, *lib. 4. cap.* 133, that an infusion of this plant communicates to the hair. Weeds of little beauty and easy culture.

1975. *Amarantus* From *a*, privative, and μαραινω, to wither, because the flowers of most of the species retain their bright colors when dead. Some of the species are very ornamental, and most of them might probably be used as spinage, as some sorts are in the East. A. polygamus is used in this way in Guiana and China, and A. oleraceus, tristis, and viridis, in India. A. melancholicus and tricolor are popular tender

History, Use, Propagation, Culture,

annuals, and A. sanguineus and caudatus common border flowers, like all the species, they are of easy culture in light rich soil. Most of the species are very prolific in seeds, which preserve their germinating quality several years.

1976. *Luffa.* Its name in Arabic is *loûff*, according to Forskahl. A curious kind of gourd, not often seen on account of its offensive odor. It is cultivated in Arabia and China. It climbs up the Palm trees, covering and elegantly adorning their trunks. The fruit when young is pickled, like the Mango, but Europeans think it has a disagreeable taste, and is not very wholesome. L. Charantia has a fruit with a yellowish skin, but very red flesh, and when ripe, it bursts elastically. Culture as in Cucumis.

1977. *Ambrosia.* A poetical name. *Ambrosia* is the name of the food of the heathen divinities, as nectar was their beverage, of the former, the odor was delightful, whence its name has been applied to an herb, the leaves of which, when bruised, emit a grateful scent. Weedy plants of no beauty.

1978. *Securinega.* From *securis*, a hatchet. The name was given by Commerson, because the wood was so hard as to be capable of being manufactured into cutting instruments. It grows and flowers freely in loam and peat, and cuttings strike in sand under a hand-glass.

1979. *Zizania.* One of the Greek names of the rye-grass was ζιζάνιον; according to Golius, the same plant was called by the Arabs *Zohán.* The modern plant has no relation to the ancient, being a native of America, where it is called Canada rice. This plant has been acclimated in Middlesex and Ross-shire, it grows on the margins of ponds, and is exceedingly prolific of bland farinaceous seeds, which afford a very good meal. It abounds in all the shallow streams of North West America, where its seeds contribute essentially to the support of the wandering tribes of Indians, and feed immense flocks of wild swans, geese, and other water fowl. Pinkerton says, this plant seems intended by nature to become the bread corn of the north.

1980. *Pharus.* From φάρος, a covering. Brown gave this name to the plants, because their long broad leaves are employed as wrappers for various purposes by the natives of Jamaica. Fine *stove* grasses.

1981. *Guettarda.* Etienne Guettard was a French botanist, who published in 1747, a catalogue of the plants growing in the vicinity of Estampes. Splendid plants, which grow in loam, peat, and sand; and are increased by cuttings in sand in a moist heat and covered.

1982. *Sagus.* So named in allusion to the nutritive properties of the substance obtained from it. From this palm is produced the Sago of the shops. The wood is full of white pith, like that of elder; the pith is taken out, bruised in a mortar, and then put into a cloth or strainer, held over a trough, and water being poured in, the pith is washed through the cloth into the trough; the water being then drawn off, the sago is taken out and dried for use or transportation. The fruit is eaten by the Japanese, but the tree is chiefly esteemed for its highly nutritive pith.

1983. *Cocos.* Linnæus regards this name as of Greek origin. In that language, κωκος means a kind of fruit, but it does not appear that there was any relation between that and the modern cocoa nut. D'Herbelot

13303 Racemes pentandrous terminal compound, Axillæ spiny
13304 Clusters densely spiked somewhat whorled, Spikes decompound erect colored, Lvs. obl. ellipt. red beneath

13305 Leaves cordate 5-lobed, Flowers large, Gourd a span long

13306 Leaves ovate sessile acuminate serrate ciliated at base
13307 Leaves 3-lobed serrated
13308 Leaves bipinnatifid smoothish, Petioles with long ciliæ, Racemes terminal panicled
13309 Leaves bipinnatifid hoary beneath: upper pinnatifid, Racemes 3 terminal
13310 Leaves smooth bipinnatifid: upper pinnatifid, Racemes terminal solitary, Branches fastigiate
13311 Leaves bipinnatifid blunt hoary beneath, Racemes terminal solitary, Branches villous

13312 Leaves alternate ovate, Flowers axillary clustered

HEXANDRIA.

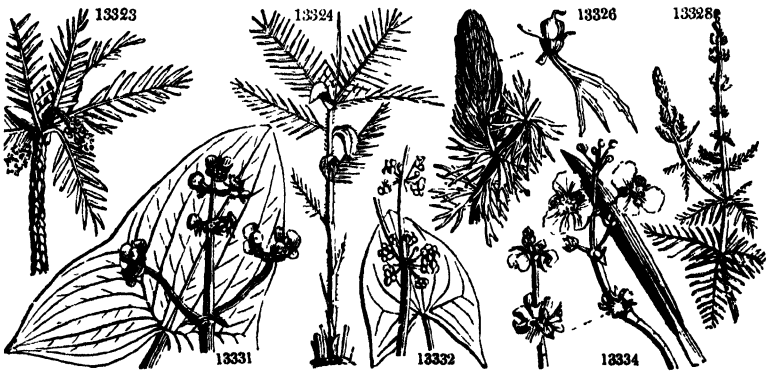
13321 Caudex cylindrical prickly upwards, Fronds pinnated prickly
13322 Aculeate spiny, Caudex fusiform, Fronds pinnated, Stems and spathes spiny

and Miscellaneous Particulars.

says, (*Bibl Or* 278) that in India the fruit is called *coza*, whence the Turkish name *coz*, for a nut: but this requires confirmation. In Malabar it is called *tenga*, in the Moluccas *calappa*, and by the Brahmins *medo*. C. nucifera is a native of, and cultivated in, most places within the tropics. The trees grow to a great height, with a straight trunk, and, like almost every species of the Palm tribe, without branches. The leaves are from twelve to fifteen feet long, the flowers come out round the top of the trunk in large clusters, inclosed in a sheath, and the nuts succeed them, commonly ten or twelve together

There are few trees more extensively or variously useful The leaves are employed as thatch to cover houses, and to make mats either for sitting or lying upon The leaf, when reduced to fine fibres, is the material of which a beautiful and costly carpeting is fabricated for those in the higher ranks, the coarse fibres are made into brooms. After these useful materials are taken from this leaf, the stem still remains, which is about the thickness of the ankle, and furnishes firewood

The wood of this palm, when fresh cut, is spongy, but becomes hard after being seasoned, and assumes a dark brown color. On the top of the tree a large shoot is produced, which, when boiled, resembles brocoli, but is said to be of a more delicate taste, and though much liked, is seldom used by the natives, because on cutting it off, the pith is exposed, and the tree dies Between this cabbage-like shoot and the leaves, there spring several buds, from which, on making an incision, there distils a juice differing little from water, either in the color or consistence It is the employment of a certain class of men to climb to the top of the trees in the evening, with earthen pots tied to their waists, which they fix there to receive the juice, which is regularly carried away before the sun has had any influence upon it. This liquor is sold at the bazaars by the natives under the name of toddy. It is used for yeast, and forms an excellent substitute. In this state it is drank with avidity, both by the low Europeans and the natives, and is reckoned a cooling and agreeable beverage. After being kept a few hours, it begins to ferment, acquires a sharp taste, and a slight intoxicating quality. By boiling it, a coarse kind of sugar is obtained, and by distillation, it yields a strong ardent spirit, which being every where sold, and at a low price, constitutes one of the most destructive annoyances to our soldiers. The name given to this pernicious drink by Europeans, is Pariah arrack, from the supposition that it is only drank by the Pariahs, or out-casts, that have no rank.



The trees from which the toddy is drawn do not bear any fruit, on account of the destruction of the buds, but if the buds be left entire, they produce clusters of the cocoa nut. This nut in the husk is as large as a man's head, and when ripe falls with the least wind. If gathered fresh, it is green on the outside; the husk and the shell are tender. The shell, when divested of the husk, may be about the size of an ostrich's egg, and is lined with a white pulpy substance, which contains about a pint and a half of a liquor like water, and though the taste be sweet and agreeable, it is different to that of the toddy.

In proportion as the fruit grows old, the shell hardens, and the liquor diminishes, till it is at last entirely absorbed by the white milky substance, which gradually acquires the hardness of the kernel of the almond.

History, Use, Propagation, Culture,

and is almost as easily detached from the shell. The natives use this nut as their victuals; and from it they also express a considerable quantity of the purest and best lamp oil. The substance which remains after this operation, supplies an excellent food for poultry and hogs. Cups and a variety of excellent utensils are made of the shell.

The husk of the cocoa nut is nearly an inch thick, and is, perhaps, the most valuable part of the tree, for it consists of a number of strong fibres, easily separable, which furnish the material for the greatest part of the Indian cordage, but is by no means the only substitute which the country affords for hemp. This the natives work up with much skill.

Plants of the cocoa nut tree are frequent in our stoves, being easily raised from the nuts sold in the shops, planted in rich earth, and on a moist heat, but the plants are seldom allowed room enough to come into flower, though it has been observed, that this is almost the only palm that could be cultivated in this country for perfecting its fruit, all the others being dicecious plants Sweet observes, that they seldom succeed well in our collections; perhaps from being too much exposed to the sun: he is "informed they thrive best in the shade in the West Indies, where cultivators of them plant tall trees near them for that purpose." (*Bot. Cult.* p. 42.)

C. aculeata has a trunk the thickness of the human body, the pinnæ of the fronds are longer than in the cocoa, and prickly like the bark of the trunk. The fruit is as large as a crab, and of the same shape, under a green skin it has a thin sweetish astringent pulp; and within that, a nut full of a white sweet eatable kernel. The nut is said to yield the true palm oil The outside of the trunk is made into laths, bows, and darts.

1984. *Elate.* This was one of the names given by the Greeks to the membrane which envelopes the female flowers of the date; that is to say, to its spatha. Modern authors have applied the word to a kind of Indian palm. The fruit of E. sylvestris resembles a wild plumb The poorer sort of people chew it in the same manner with the Areca nut, with the leaf of the betel pepper and quick-lime. The elephants are fond of the fruit-stalks, which are very sweet. In our stoves the plants require a sandy loam, and a strong heat.

13323 Fronds pinnated, Leaflets opposite

13324 Fruit roundish
13325 Fruit ovate

POLYANDRIA.

13326 Fruit armed with three spines

13353 Thorns none, Stem somewhat angular, Stamens much longer than the calyx
13354 Unarmed, Stems angular, Terminal flowers female lower male, intermediate hermaphrodite

and Miscellaneous Particulars.

1985 *Bactris.* So called by Jacquin, from βακτηρον, a cane, because the small stem is made into walking-sticks, which are much valued. B minor produces a fruit of a dark purple color, the size of a common cherry, containing an acid juice, of which the Americans make a sort of wine It is also eaten raw, but is not pleasant. Canes are made of the stem, they are dark-colored, shining, jointed, and very light; the French call them *Cannes de Tobago* B major has a large nut with a solid kernel, which is eaten in Carthagena. In our stoves they form handsome plants, and grow freely in sandy loam; like other palms, they are only to be increased by seed.

1986. *Ceratophyllum.* So called from κερας, a horn, and φυλλον, a leaf, on account of the numerous horned divisions of the leaves. Aquatic weeds of no beauty

1987. *Myriophyllum.* From μυριος, a myriad, and φυλλον, a leaf, on account of the infinite number of divisions of its leaves Aquatics of some beauty, and the easiest culture.

1988. *Sagittaria* So called from *sagitta*, an arrow, in reference to the arrow-headed form of the leaves. S. sagittifolia is one of the handsomest of British aquatics, and is common in Siberia, China, Japan, and Virginia The bulb, which fixes itself in the solid earth below the mud, constitutes an article of food among the Chinese, and upon that account they cultivate it extensively. The roots are larger in those countries than with us. All the species are of common culture.

1989 *Begonia.* Named in honor of Michael Begon, a Frenchman, born in 1638; he was an intendant of Marine, and a promoter of botany. These are universally plants remarkable for the neatness of their foliage, and their succulent habit. B. argyrostigma and discolor are the two most beautiful species. They are all cultivated without difficulty either from seeds or cuttings.

1990. *Potersum* Literally, this word signifies a drinking vessel, and in the same sense, a kind of beverage A drink was made of it, which was reckoned useful in many complaints, it is also an ingredient in cool tankards. P. sanguisorba is sometimes sown along with clover as an herbage plant, it is now, however, out of

History, Use, Propagation, Culture,

repute The leaves when bruised smell like cucumbers, and taste something like the parings of that fruit; they are sometimes put into salads. All the species are of the easiest culture.

1991. *Amirola* A word with an unknown meaning The Peruvians form the shining black seeds of Amirola nitida into rosaries

1992. *Acidoton.* From ακιδωτος, pointed, in allusion to the stinging pointed hairs of the leaves.

1993. *Thelygonum.* A name under which Pliny described a plant which appears to have been Mercurialis It was derived from θηλυς, a woman, and γονυ, a knee, because of its joints, which where thought to resemble a woman's knee. Cyno-crambe, literally interpreted dog-cabbage, was the Greek name of Mercurialis perennis

1994 *Castanea* A native of the territory of Castanea, a town of Thessaly, near the borders of the river Peneus, where magnificent chesnut trees still are found The chesnut, *Châtagnier*, Fr, *Castansenbaum*, Ger, *Castagno*, Ital, is, like the walnut, both a timber and a fruit tree, some of the oldest trees in the world are of this species, as that mentioned by Brydone on Etna, and the chesnut at Tortworth, in Gloucestershire The fruit is generally eaten roasted, abroad, it is not only boiled and roasted, but ground into meal, and puddings, cakes, and bread are made from it. The timber is thought to have been formerly in very general use for house carpentry, though some consider what is generally called chesnut in our old buildings as oak. It is one of the best trees for hop poles, and scarcely any other is now planted in Kent and other hop districts for that purpose. Some excellent fruit-bearing varieties have been lately imported from France, these are increased by grafting or budding in the usual methods, but the plants for coppice woods or timber are best raised from nuts There is a variety with striped leaves which is very ornamental. The most esteemed of the French kinds are called *Marron*, a word which in old French literally signifies a substance, which it must be confessed the fruit is not unlike.

The American chesnut differs so little from the European, that no specific distinction can be drawn It is one of the largest and most useful trees of the forests, the wood being extremely durable, and in high esteem for posts and rails to construct fences The nuts are very delicious The Castanea pumila or Chinquapin nut, is a small tree, or rather shrub, growing to the height of thirty feet in the southern states, but scarcely exceeding seven or eight in cold latitudes. The fruit is very sweet and agreeable to eat.

1995. *Ostrya.* So called from οστεον, a scale, in allusion to the scaly catkins of the fruit, which resemble those of the hop, whence the plants are called Hop-Hornbeam. The wood of Ostrya virginica is exceedingly hard and heavy, whence it is generally known in America under the name of Iron-wood. In some parts it is called Lever-wood.

1996. *Carpinus.* From the Celtic words *car*, wood, and *pin*, the head, that is to say, wood fit for the yokes of cattle. The wood is white, and of a fine close texture, which makes it peculiarly fit to be wrought into the

13355 Unarmed, Stems round striated
13356 Unarmed shrubby, Branches round villous, Spikes long loose
13357 Spiny shrubby, Spines branched, Branches villous somewhat angular, Spikes oblong loose

13358 Leaves simple and ternate ovate serrated, Petioles thickened on each side

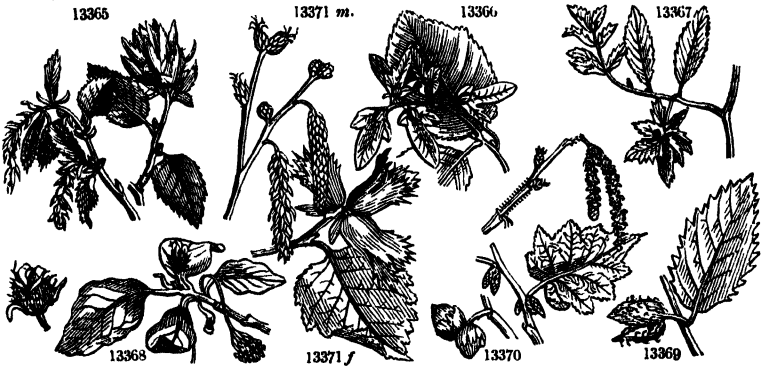
13359 Leaves alternate lanceolate ovate, Flowers in racemes

13360 Leaves ovate, Stem diffuse

13361 Leaves oblongo-lanceolate acuminate mucronate serrate glabrous on each side
13362 Leaves oblong acute mucronate serrate white with down beneath

13363 Cones ovate pendulous, Leaves ovate acute, Buds blunt
13364 Cones oblong ovate erect, Leaves oblong ovate acuminate, Buds acute

13365 Scales or bracteas of the fruit oblong serrated with two smaller lateral lobes



13366 Scales of cones 3-parted middle segment oblique ovate lanceolate 1-toothed on one side
13367 Scales of cones ovate unequal at base undivided somewhat angular unequally serrated

13368 Leaves ovate glabrous obsolctely dentate, their margins ciliated

13369 Leaves ovate acuminate downy beneath coarsely toothed ciliated at edge

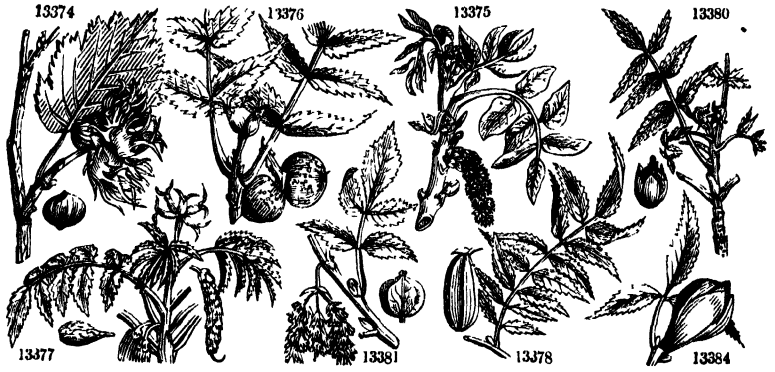
13370 Stip. obl. obt Lvs roundish-cordate pointed, Invol. of fruit campanulate rather spreading torn at margin

13371 Stip. obl. blunt, Cal. of fruit tubul cylind contracted at end cut toothed, Leaves roundish cord acuminate

and Miscellaneous Particulars

various forms with which the country people of all nations have delighted to ornament their yokes. Our English word Horn-beam has evidently the same meaning C Betulus is a tree of little merit or beauty, having persistent leaves like the beech, it is well adapted for hedges or separation, where the object is shelter

1997 *Fagus.* From the Greek φαγος, which also signifies eatable We all know that mast was the original food of man The Fagus of Virgil, was the Quercus Æsculus. *Hêtre*, Fr, *Büche*, Ger., *Faggio*, Ital. F sylvatica is a handsome tree in every stage of its growth It seems to thrive best in a chalky clay or loam, rather sheltered It is one of the handsomest single trees for parks, and is well adapted to form lofty hedges The timber is brittle, and not of long duration, but it is much used by turners, joiners, and millwrights. The bark is remarkably thin, and has been used for making baskets and band-boxes The leaves are used in France by the country people, on account of their elastic quality, instead of straw for the paillasse to lay under their mattrasses The mast is readily eaten by swine and deer



F cuprea, the copper colored, and F. purpurea, the purple beech, are two of the most striking of timber trees, from the color of their foliage. They are propagated by grafting, and grow as freely as the common beech.

Fagus ferruginea is distinguished by the Americans from the common kind by the name of Red Beech, the wood being of a darker color.

1998. *Corylus* From κορυς, a bonnet, to which the enwrapping calyx may be very well compared. Our word Hazel is in like manner derived from the Anglo-Saxon *Hæsel*, which signifies an head-dress. *Noisette*, Fr, *Nussbaum*, Ger, and *Avellano*, Ital C avellana has the specific name from Avellino, a city of the kingdom of Naples, near which, in a valley, it grows to a great extent, and in Swinburne's time, brought in an annual profit of near 12,000*l* sterling It is said they were originally imported into Italy from Pontus, and known among the Romans by the appellation of nux Pontica, which in process of time, was changed into that of nux Avellana, from the place where they had been propagated with the greatest success The common Hazel-nut is wild in many woods and coppices in Britain, whence the fruit is gathered in plenty and sent to the neighbouring markets. As underwood, the plant is of some value for hoops, fishing-rods, walking-sticks, withes for faggoting, crate-making, hurdles, wattling-fences, and springles to fasten down thatch Formerly the roots were used by the cabinet-makers, and where yeast was scarce, they twisted the twigs, steeped them in ale during its fermentation, hung them up to dry, and when they brewed put them into the wort.

There are several varieties of the cultivated filbert. What is called the frizzled filbert is esteemed the best. The plants do not require a rich soil, but one with a dry bottom. They are generally propagated by suckers, and grown as dwarf standards, each plant with a single clean stem, from six feet high down to twelve inches When allowed to throw up suckers from the root and form a thick bush, they cease to bear fruit in any quantity The filbert bears principally upon the sides of the upper young branches, and from small shoots which proceed from the bases of side branches cut off the preceding year. Hence the spurring-in method of

History, Use, Propagation, Culture,

pruning is the most successful in the production of fruit. C Colurna may be treated in the same manner as the other, but the plants kept at a somewhat greater distance apart

The nuts of the American Hazel-nut, Corylus americana, are very excellent.

1999 *Juglans* That is to say, *Jovis glans*, the nut of Jove, on account of its excellence, which must have been great indeed, when gods had nothing but oak or beech-mast to eat J regia, walnut, from *gaul*-nut, the tree being introduced from France, *Noyer*, Fr, *Walnussbaum*, Ger, and *Noci*, Ital, is cultivated both as a fruit and timber-tree The fruit in a green state, before the stone hardens, is much used for pickling, and also as an adulteration of soy sauce An oil, which supplies the place of that of almonds, is expressed from the kernel in France In Spain they strew the gratings of old and hard nuts, first peeled, into their tarts and other meats. The leaves strewed on the ground, and left there, annoy worms, or macerated in warm water, afford a liquor, which from its bitterness may effect their death The unripe fruit is used in medicine for the same purpose Pliny says, "the more walnuts one eats, with the more ease will he drive worms out of the stomach" The timber is used in this country for gun-stocks, being lighter in proportion to its strength and elasticity than any other It is used in cabinet-work in most parts of the continent the young timber is held to make the finest colored work, but the old to be finer variegated for ornament When propagated for timber, the nut is sown, but when fruit is the object, marching from the branches of fruit-bearing trees is preferable Budding has also been successfully adopted by Mr Knight, the buds succeed best when taken from the base of the annual shoots, ordinary-sized buds from the upper parts of such shoots generally fail. Walnut trees that have not been grafted or budded, may be induced to produce blossoms by ringing the bark

Juglans nigra, the black walnut, is a tree of large size, and its nuts are eaten by men and several species of animals. The wood is put to various mechanical and economical uses J. cathartica is known under the name of butter-nut, oil-nut, and white walnut, the nuts are used by the American Indians medicinally. The fruit of J. olivæformis, or the Pekan-nut, is delicious, sometimes it is exposed in the fruiterers' shops for sale. The nuts of J. sulcata, which is called thick shell-bark hickory, and Springfield and Gloucester nut, are large and well-tasted. The shell-bark hickory, shag-bark, or scaly-bark hickory, J. alba, is so called on account of its bark, which is torn lengthwise in long loose strips, as in J sulcata. The wood of J tomentosa, the Mocker-nut, white-heart hickory, or common hickory, is excellent for mechanical purposes, and particularly esteemed as fire-wood; but the nuts are hard, with but little kernel in them The Americans make very good and durable brooms by slitting into narrow slips the very tough wood of J. glabra, which is called pig or hog-nut, also broom hickory.

13372 Cal. of fruit roundish campan. larger than nut, Lamb dilated tooth serrated, Lvs. roundish cord. acumin.
13373 Stip. lin. lanc Cal. of fruit camp. tubul larger than nut 2-parted: seg cut toothed, Lvs. obl. ovate acumin.
13374 Stip. lanc. acum. Cal. of fruit double: outer many-parted; inn 3-part. Seg palm. Lvs. roundish ov. cordate

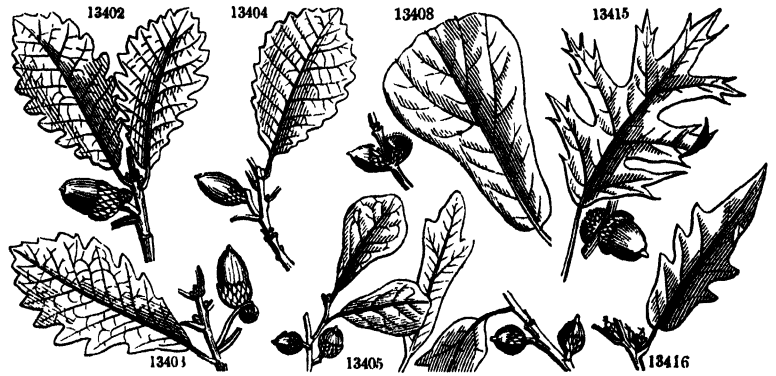
13390 Leaves elliptical oblong acute at each end entire almost sessile downy beneath, Nut nearly globose
13391 Leaves obovate entire smooth nearly sessile tapering at the base, Nut roundish even

13392 Leaves obovate entire shining somewhat heart-shaped at the base downy and yellow beneath

B *Leaves toothed spiny*

13393 Leaves elliptical coriaceous entire or serrated very downy beneath, Bark even, Nut cylindrical elongated
13394 Leaves ovate-oblong acute coriaceous entire or serrated hoary beneath, Bark even, Nut ovate

13395 Leaves ovate-oblong bluntish coriaceous entire or sharply serrated downy beneath, Bark cracked fungous
13396 Lvs. ellipt.-obl rigid smooth on both sides with spread brist spin. teeth, Nut ov Cal with spread point. ac
13397 Leaves roundish ellipt. nearly sess undulated with deep spin. divaricat. teeth densely downy beneath somewhat heart-shaped at the base



and Miscellaneous Particulars.

2000. *Quercus.* This name is derived from the Celtic *quer*, fine, and *cuez*, a tree, it was so called, in distinction to other trees, because the holy misseltoe grew upon it · otherwise the common name of the oak in Celtic was *derw*, whence *druids*, and the Greek δενς Phellos was the Greek name of the cork, Q. suber. Gramuntia has derived its name from growing in the wood of Grammont, near Montpelier. Suber is generally thought to have been formed from the Latin *sub*, under, because the bark was used by the Roman women as sandals, both for keeping their feet dry, and increasing their stature, but Vossius is of opinion, that it comes from συφαι, the Greek name of bark of any kind Coccifera has been so called because the little insect, coccus, which affords the well-known kermes dye, is found upon it. Kermes itself is an alteration of *qermez*, which signifies in Arabic, a little worm, the same people called the red dye *qermezy*, whence our Norman-English word *cramoisye* Robur is an alteration of *rove*, a Celtic synonym of the oak. Ægilops, literally goat's-beard, was so called on account of the long truss or beard-like lichens which were frequently found hanging suspended from it

The oak is a genus of trees familiar to man in the temperate zones of both hemispheres Q. Robur, now valued for its timber and bark, and formerly for its acorns, is familiar to every Briton There are two distinct varieties or subspecies, Q sessiliflora and pedunculata, and another Q pubescens Q. pedunculata is thought to be the common oak of England, being much more frequent in natural woods than the others. The timber of this variety is said to be whitish and hard, while that of the sessile-fruited is reddish and brittle. The bark of this and all the hardy species of oak is or may be used by the tanner. Oak saw-dust is the principal indigenous vegetable used in dyeing fustian, and different shades of drab and brown are also made from it Oak-apples are used in dyeing as a substitute for galls, the black got from them by the addition of copperas is more beautiful than that from galls, but not so durable These galls are occasioned by an insect of the Cynips kind, which deposits its eggs in the substance of the leaf When the bark of the oak has performed its office to the tanner, it is employed by the gardener to produce heat by its fermentation. Oak leaves are also used for the same purpose When a great proportion of the island was in forest, acorns were of importance for feeding swine; they are still valued for this purpose in districts where the oak abounds, as in Hampshire and Northamptonshire. Q cerris is a very handsome tree, and the timber is considered nearly as valuable as that of the common oak The Lucombe (from the name of the nurseryman who raised it) and Fulham (from the name of the nursery where it was first originated) varieties are nearly evergreens; they retain their verdure till Christmas, and remain on the tree in a brown or withered state till April or May following.

Q. coccinea is one of the handsomest of the American oaks; the leaves, which are six inches long, change in

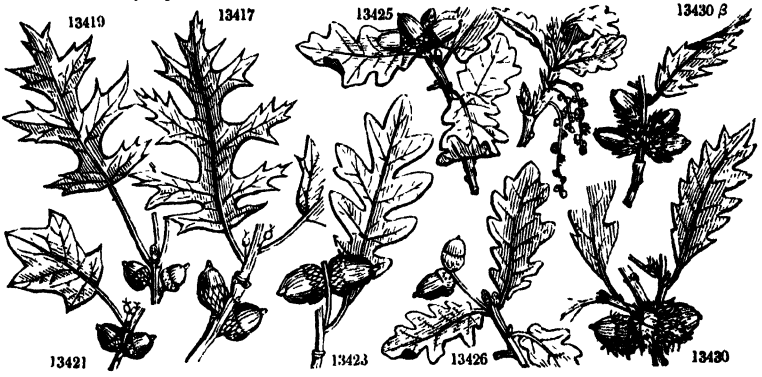
History, Use, Propagation, Culture,

autumn to a beautiful scarlet color, and unless hard frost comes on early, they do not fall off the tree till near Christmas. Q. rubra bears a near resemblance to the last species. Q tinctoria, *Quercitron*, Fr., has been recommended to be cultivated on account of its bark, which affords a valuable yellow dye. (*Calcd. Hort Mem.* iii. 378.

Q. suber is cultivated in Spain, Portugal, and the south of France, for its cork-bark The exterior bark is the cork, which is taken from the tree every eight or ten years, but there is an interior bark which is left on to protect the tree, so that stripping off the outer bark is so far from injuring the trees, that it is necessary to their continuation Trees that are never barked are said to die at the age of fifty or sixty years. The bark is taken off for the first time when the tree is about fifteen years old; it soon grows again, and may be rebarked three times, the bark improving every time till the tree attains the age of thirty years It is taken off in sheets or tables, much in the same way as oak or larch bark is taken from the standing trees in this country. After being detached, it is flattened by presenting the convex side to heat, or by pressure. In either case it is charred on both surfaces to close the transverse pores, previously to its being sold. The carbonized surface produced by this charring, may be seen in bungs and taps, but not in corks, which being cut in the lengthway of the wood, the charring is taken off in the rounding.

13398 Leaves elliptic. with deep point. serratures downy beneath, Fruit racemose, Cal. hemispherical, Nut obl.
13399 Lvs. on short stalks obov. acutely and coarsely toothed at base glaucous ben. Cup hemispheric. Acorn ov



C. Leaves sinuated.

13400 Leaves oblong mucronate-toothed smooth on each side
13401 Leaves oblong coarsely mucronate-toothed smooth on each side cuneate at base, Branchlets hairy
13402 Lvs. on long. stalks obov. ac somew downy ben. with near eq serrat. Cal of fr contract at base, Nut ov.
13403 Lvs. nearly sess. obovate downy and white beneath with very broad unequal teeth, Fruit in pairs on long bristle-pointed stalks, Calyx hemispherical, Nut oblong ovate
13404 Lvs. on shortish stalks obovate acute downy and white beneath with nearly equal dilated short blunt serr. Cal. hemispherical with rugged scales, Nut oblong ovate
13405 Lvs wedge-shaped smooth tapering at the base dilated and obscurely 3-lobed at the end: the middle lobe largest, Calyx nearly hemispherical, Nut roundish
13406 Lvs. obl wedge-shaped smooth somew sinuated 3-lobed at extrem Lobes divaricated pointed: the middle one largest, Forks of the vein downy beneath
13407 Lvs on long footst. obl lanc pointed somewhat downy ben with numerous nearly equal dilated serratures, Cal. hemispherical, Nut round ovate
13408 Lvs. wedge-shaped somew cord dilated very slightly 3-lobed at the end, smooth above rusty beneath, Cal. hemispherical with membranous scales, Nut round ovate
13409 Lvs wedge-shaped with 3 terminal bristly-pointed lobes: the midd one longest downy beneath, Cal of the fruit flattish, Nut nearly round
13410 Leaves oblong sinuated downy beneath · lobes blunt, upper dilated 2-lobed, Cups hemispherical

13411 Leaves evergreen oblong-lanceolate undivided 3-lobed or sinuated smooth on both sides, Lobes pointed
13412 Lvs. downy ben. sinuat. with 3 or more somew falc brist.-point lobes term. one elong jagg Cal hemisph [undern Nut globose

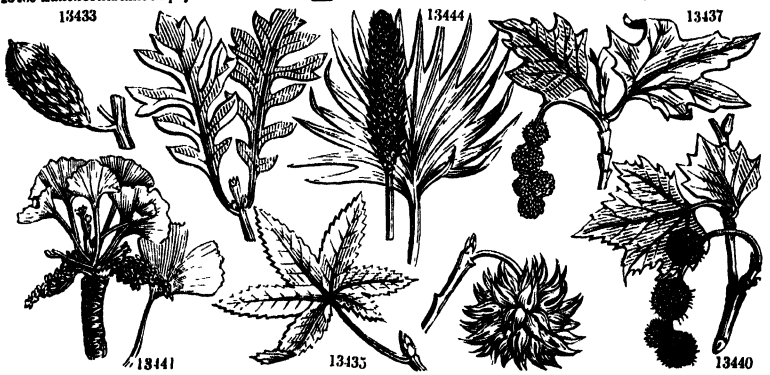
13430 Lvs. on very short stalks obl. deeply and uneq pinnatif hairy ben. Stip longer than footst. Cal of the fruit

13431 Lvs. on longish stalks ovate obl slightly but copiously sinuated downy and hoary ben. · lobes short ovate acute entire, Stipules shorter than the footstalks, Cal of the fruit hemispherical bristly



and Miscellaneous Particulars.

The uses of cork in Britain are well known It was used as sandals by the Greeks, whence our cork soles, and probably the Venetian choppings (*cioppini*, Ital.), or shoes so high heeled, as to raise the women above the men. The poor people in Spain lay broad planks of it by their bed-side to tread on, as great persons use Turkey and Persian carpets to defend them from the floor; and sometimes they line the walls and insides of their houses built of stone with this bark, which renders them very warm, and corrects the moisture of the air. Both in Spain and Barbary bee-hives are made of cork, for this purpose, they roll the bark into a cylinder of five or six feet long, and six inches in diameter, boring holes for the entrance and exit of the bees, as in the Polish hive. (*Encyc. of Gard.* 1738.)

Q. coccifera, *Cusoja*, Span., has prickly leaves like those of the holly, or Q. ilex, from this species is collected the kermes or scarlet grain, a little red gall, occasioned by the puncture of the Coccus ilicis. With these galls scarlet color was dyed, till the discovery of America, when another species of Coccus, the cochinillifer, was found in the Mexican woods upon the Cactus.

Q. phellos is remarkable for the form of the leaves, which differ in character from those of the rest of the species. Q. ilex, the holly, or holm oak, *Chêne verd*, Fr., *Elice*, Ital., and *Euzina*, Span., is a handsome evergreen tree, and the timber is supposed equal to that of the common oak. Q gramuntia is thought by some

History, Use, Propagation, Culture,

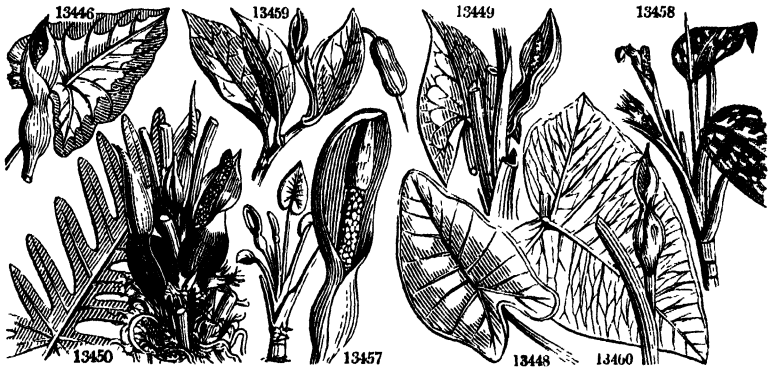
to be only a variety of this species The acorns of Q esculus are sweet, and, it is said, are frequently eaten by the poor in the south of France the tree very much resembles the common English oak.

The willow oak grows to the height of about fifty or sixty feet The Q virens, or live oak, grows to the height of forty or fifty feet, spreading its branches, when in open places, extremely wide, it yields the finest and most durable ship-timber of any species known, for which reason it is considered one of the most valuable trees in America The laurel oak, or, as it is sometimes called, swamp willow oak, is about fifty or sixty feet high, its wood, according to the elder Michaux, is very valuable, and almost preferable to that of Q. virens. The water oak, Q aquatica, is about forty feet high when full grown · its wood is but little valued. Its leaves vary according to the soil and age, *ad infinitum* There is scarcely one tree found having leaves like the other, and the same tree is almost as variable in its different branches The downy black oak, Q triloba, is from twenty to forty feet high, according to Michaux, of very rapid growth, and extremely well calculated for inclosing land. The barren oak, or black jack of the Virginians, Q nigra, is of low growth, especially in the more northern states, it bears very abundantly, and furnishes a fine mast for hogs, the wood is small, but excellent for fuel The black oak, or Quercitron, Q tinctoria, is one of the largest trees of the American forest, and highly valuable on account of its timber as well as bark, which is very superior for tanning to any other oak. Q falcata is a very large tree, commonly called Spanish oak. The wood of the upland white oak, or iron oak, is of great value in ship-building The fruit of the Q Prinus, known by the name of the chesnut white oak, swamp chesnut oak, and, in the southern states of North America, white oak, is large, and of a sweet taste The bark of the rock chesnut oak, Q montana, is excellent for tanning The yellow oak, Q castanea, is a large and beautiful tree with eatable acorns

2001 *Liquidambar* From this tree flows a strong balsamic substance, which has been compared to ambergris, and named from *Ambar*, amber, and *liquidum*, fluid. L. styraciflua, in its general form and leaves, bears a considerable resemblance to the lesser Maple, (Acer campestre) as the wood is good timber and beautifully variegated Between the wood and the bark issues a fragrant gum, which trickles from the wounded trees, and by the heat of the sun congeals into transparent drops, which the Indians chew as a preservative to their teeth. It smells like the balsam of Tolu The species are propagated by layers, or from seeds.

The sweet gum-tree, or Liquidambar styraciflua, is sometimes found of an immense size, particularly in the southern states, its wood is of an exquisite hard texture and fine grain, and furniture made of it has a handsome appearance.

2002. *Platanus* From πλατυς, ample, broad, in allusion to the shadow afforded by the foliage. The species are trees of peculiar grace and elegance, and from that circumstance, and the classical associations attached to them, they are eminently adapted for pleasure grounds The chenar, or eastern plane, is very much employed



13432 Leaves oblong sinuate serrated downy beneath, Bark fungous
13433 Lvs. obl smooth glaucous ben. deeply and unequally pinnatif. Fruit ellipt.-ovate, Cal. cup-shaped fringed
13434 Lvs obl. deeply sinuated smooth much contracted in the middle: lobes acute; the upper ones dilated angular and abrupt, Calyx of the fruit globose muricated nearly covering the nut
13435 Leaves palmate-lobed, Recesses at the base of the veins villous
13436 Leaves palmate-lobed, Recesses at the base of the veins smooth

13437 Leaves 5-lobed palmate cuneate at base, Segm. lanceolate sinuated, Stipules nearly entire
13438 Leaves 3-5-lobed toothed cuneate at the base smoothish
13439 Leaves cordate 5-lobed remotely toothed truncate at base
13440 Leaves 5 angular obsoletely lobed toothed cuneate at base downy beneath

13441 The only species

13442 Fronds forked: segments ensiform narrow, Stems round
13443 Fronds forked. segments lanceolate, Stems channelled
13444 Fronds flabelliform 3-5-parted

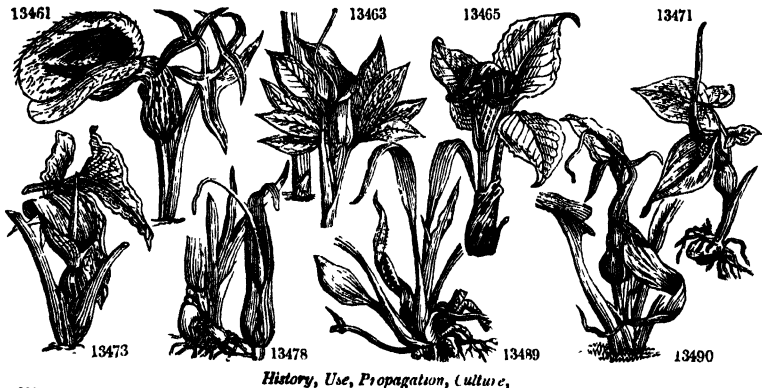
13445 Stemless, Leaves pedate entire, Spadix as long as spathe [contracted in the middle
13446 Stemless, Lvs pelt-cordate sagittate colored in the disk, Spadix shorter than the hooded spathe, which is
13447 Stemless, Lvs peltate-cordate sagittate, Spadix longer than the cylindrical spathe sagittate at end
13448 Stemless, Leaves peltate-cordate, Spadix shorter than ovate-lanceolate spathe
13449 Stemless, Leaves sagittate acuminate, Spadix shorter than ovate-cucullate spathe
13450 Stemless, Leaves pinnatifid
13451 Caulescent suberect, Leaves oblong cuspidate, Spadix shorter than oblong spathe
13452 Caulescent rooting, Leaves cordate sagittate, Spadix as long as the cucullate ovate spathe
13453 Caulescent erect, Leaves sagittate, Spadix shorter than the cucullate ovate spathe
13454 Caulescent rooting, Leaves ternate, Petioles naked, Spadix as long as the cucullate ovate spathe
13455 Caules. root. Lvs ternate. leaflets eared at base on outside, Petiol winged bel. Spad shorter than spathe
13456 Caulescent rooting, Leaves cordate sinuate
13457 Caulescent, Leaves cordate with rounded lobes, Spadix as long as cymbiform spathe
13458 Caulescent suberect, Leaves oblong acuminate cuspidate cordate at base finely spotted with clear white
13459 Caulescent scandent, Leaves ovate oblong acuminate, Spadix longer than cucullate spathe
13460 Caules. erect, Lvs. cord sagittate, Spadix shorter than spathe, which is cucullate and contracted in middle

and Miscellaneous Particulars

in the gardens of Persia and India; it was highly esteemed by the Greeks and Romans, and was planted near their houses in the form of avenues and groves Groves of these trees are still equally revered in India, and are commonly found near the native temples and burial places of the princes. The timber is considered of similar quality to that of sycamore All the species are of easy culture by layers, and they will also grow by cuttings

The Platanus occidentalis is known in America by the name of the button-wood, water beech, sycamore, and plane-tree, in Canada it is called cotton-tree It is, perhaps, the largest tree in North America, on the fertile banks of the Ohio and Mississipi there are trees measuring from ten to sixteen feet in diameter

2003. *Salisburia* So called in honor of Richard Anthony Salisbury, F. R S., a modern distinguished botanist. A large tree remarkable for its fan-shaped leaves, cloven like some of the Adiantum species The fruit is a pale brown drupe of a globular form, it has never been produced in this country, though there are trees of a considerable size The fruit is yellow when ripe, with a fleshy, juicy, white pulp, adhering closely to the drupe, which is like that of an apricot The kernel is white, rather firm, sweet, with a mixture of austerity or bitterness when raw, but agreeable when roasted Dr Abel says, he saw the fruit exposed in the markets in China, but could not find out to what purpose it was applied.



2004 *Carludovica* Named by the authors of the Flora Peruviana, in honor of Charles IV, king of Spain, and Luiza, his queen, both of whom were noble patrons of botany, and deserving of a finer genus to commemorate their virtues. The species are low palm-like herbs, of little beauty, but of great botanical interest.

2005 *Caladium* A name originally employed by Rumphius, to designate some species of Arum, and revived by Ventenat. Its meaning is unknown The species have the appearance of Areca, and are only cultivated for their singularly spotted stems, or neat green leaves, which are rarely disfigured by any of the accidents to which other stove plants are liable. The species are plants of the same general appearance as Arum. C sagittifolium, *Chou-de-Brezil*, Fr, and *Essbare Arum*, Ger., bears a near resemblance to Arum Colocasia, and is carefully cultivated in the West Indies for the leaves, which are boiled and eaten as coleworts, being extremely pleasing to the taste The roots are also eaten there, but they are in less esteem than the leaves This is generally supposed to be the species of the Arum family the most universally cultivated It is found in the East and West Indies, China, Japan, New Zealand, and the South Sea Islands. The root is extremely acrid, and when eaten raw, will excoriate the mouth; but baked in hot ashes, it looses its acrimonious quality, and becomes mild and well tasted; it is, however, heavy on a weak stomach, and is apt to occasion costiveness The leaves, which are very soft, glaucous, and covered with a very fine silky nap, are used in many places instead of plates and dishes.

History, Use, Propagation, Culture,

2006. *Arum* Formerly *aron*, supposed to be an ancient Egyptian word by which the A colocasia was known The last mentioned name is an alteration of its Arabic denomination *golqás*, according to Forskahl Perennial herbaceous plants, mostly natives of hot climates The roots are fleshy, hot, and acrid, but in many species eatable, they are generally without stems, and altogether, with the Caladiums, form a very singular family A Dracunculus, *Serpentaire*, Fr, *Drachenwurz*, Ger, and *Dracunculo*, Ital, is a very remarkable plant, the stalks of the leaves being spotted with brown and purple, like the belly of a snake The flower, which, like others of the genus, has a very singular appearance, smells so strongly of carrion, that few persons can endure it. It might be used in medicine and domestic economy for the same purposes as A maculatum A Colocasia has a tuberous thick large oblong root, and leaves resembling those of the water-lily In Egypt and the Levant, this plant is esteemed a wholesome food, though not very delicate. The roots and petioles are boiled, and the leaves when young are sometimes eaten raw A trilobatum, and various others, are similarly used in the West Indies. There and in Europe the culture of all the species is of the simplest kind

A. maculatum, *Gouet*, Fr, *Aronswartzel*, Ger, and *Aro*, Ital, has a tuberous whitish root about the size of a large nutmeg, which is used both as food and medicine On tasting them, they seem to be merely mucilaginous and insipid, but they soon affect the tongue with a pungency as if pricked by needles; this uneasy sensation may be alleviated by milk, butter, or oil The acrimony is lost in drying, and the roots become farinaceous, insipid, and fit for boiling or baking. In the Isle of Portland, where the plant is very abundant, the roots are generally eaten by the country people, they are macerated, steeped, and the powder so obtained is dried and sent to London, and sold under the name of Portland sago. Medicinally, the root in its recent state is stimulant, diaphoretic, and expectorant. Though retained in the Materia Medica, it is seldom used. The berries which succeed the flower are devoured by birds, and Mr Curtis thinks, that even the roots are eaten by them, particularly pheasants. Dried and powdered, they are used by the French as a wash for the skin, under the name of cypress powder

2007. *Caryota.* The Greeks gave this name to a kind of cultivated date. Pliny says, it was so called,

13461 Leaves pedate entire, Spadix cylindrical shorter than ovate flat spathe, which is hairy inside
13462 Leaves pedate entire, Spadix lanceolate shorter than the ovate flat smooth spathe
13463 Leaves pedate entire, Spadix subulate longer than the oblong convolute spathe
13464 Leaves pedate entire, Spadix shorter than lanceolate spathe
13465 Stemless, Leaves ternate entire, Spadix clavate shorter than ovate acuminate flat stalked spathe
13466 Stemless, Leaves ternate ovate twice as short as spadix
13467 Stemless, Leaves ternate, Spadix longer than spathe
13468 Stemless, Leaves peltate ovate repand emarginate at base
13469 Stemless, Leaves paltate cordate repand 2-parted at base
13470 Stemless, Leaves cordate hastate, Spadix subulate longer than the reflexed ovate-lanceolate spathe
13471 Stemless, Leaves sagittate 3-lobed, Flowers sessile
13472 Leaves all radical hastato-sagitate: lobes deflexed, Spadix club-shaped obtuse shorter than the spathe
13473 Leaves hastate 3-parted, Spathe stalked 2-colored longer than spadix the end lanceolate and deflexed
13474 Stemless, Lvs. veiny with white hastate sagit lobes auricled diyaricating, Spad clav shorter than spathe
13475 Stemless, Lvs hastate sagittate mucronate lobes deflex Petioles dotted, Spad. cylind shorter than spathe
13476 Stemless, Leaves hastate cordate acute angles obtuse [cucullate spathe
13477 Stemless, Lvs hast sagittate mucron lobes deflexed oblong obtuse, Spadix cylind incurved shorter than
13478 Stemless, Leaves linear-lanceolate, Spadix subulate longer than lanceolate spathe
13479 Caulescent erect, Leaves peltate cordate auricles cucullate
13480 Caulescent subcrect, Leaves ovate bind at base rounded, Spadices axillary
13481 Caulescent, Leaves peltate cordate acute cut out at the base with a wide recess
13482 Leaves sagittate acute rounded at base
13483 Leaves peltate cordate sagittate, Spathe roundish oblong acute, Spadix obtuse much shorter than spathe
13484 Leaves lanceolate acute entire, Edge of petiole sheathing, Spathe cucullate
13485 Leaves peltate cordate
13486 Caulescent rooting, Leaves cordate oblong acuminate, Petioles round
13487 Caulescent creeping, Leaves cordate lanceolate, Petioles with a membranous edge
13488 Stemless, Leaves decompound bulbiferous, Spadix oblong ovate shorter than the obtuse veiny spathe
13489 Stemless, Leaves linear lanceolate, Spadix lanceolate shorter than the oblong lanc spirally twisted spathe
13490 Steml. Lvs. ov. ent. or 3-lob Spathe urceol at base reflex and taper-point at end, Spadix length of spathe

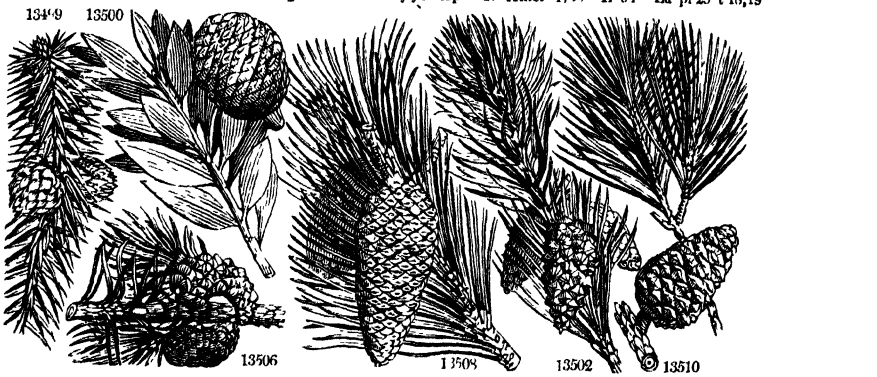
13491 Unarmed fronds bipinnate, Leaflets cuneiform obliquely bitten off
13492 Fronds bipinnate, Petioles nodding, Fruit 1-seeded

MONADELPHIA.

13493 Frond pinnated, Female flowers terminal capitate: male lateral with dichotomous peduncles

13494 Fronds pinnated, Leaflets plaited terminal bitten off, Stems and spadices smooth
13495 Fronds pinnated, Leaflets cuneiform truncate, Fruit globose ovate acute
13496 Fronds pinnated, Leaflets linear acute, Fruit oblong incurved

and Miscellaneous Particulars



because a wine was prepared from it which soon got into the head, κεφαλη, head C urens, a fine species of palm, produces flowers in long pendulous spikes, which are succeeded by strings of succulent globular berries, dark red when ripe, with a thin skin, soft pulp, and very sharp and acrid to the taste In Ceylon, it yields a sort of liquor, sweet, wholesome, and no stronger than water It is taken from the tree twice or thrice a day, and an ordinary tree will yield three or four gallons They boil this liquor, and thus make a kind of brown sugar of it, called Jaggory The fruit is not eatable When the tree has come to maturity, there comes out a bud from the top, this bud they cut and prepare by putting salt, pepper, lemons, garlick, leaves, &c. over it, which keep it from ripening They daily cut off a thin slice from the end, and the liquor drops into a vessel, which they set to catch it The buds, like those of the Cocoa and Betel-nut, are excellent in taste, resembling walnuts or almonds C mitis is a very beautiful palm, with fronds four feet long and a branched spike of flowers, succeeded by berries, round, coriaceous, smooth, black, the size of a musket bullet, but not eatable Both species grow freely in sandy loam

2008 *Nipa* The name given to this fine palm in the Moluccas

2009 *Areca* The name which this palm bears in Malabar is, when it is an old tree, *Areec;* when young it is called *Paynga* A Catechu produces the nut which is cut in slices, wrapped in the aromatic leaves of the betel-pepper, and chewed as we do tobacco These leaves are previously covered with a thin layer of shell-lime (Ehunam), to preserve the flavor longer in the mouth In most parts of the East Indies the natives are continually chewing it, swallowing their saliva tinctured with the juice, and spitting out the rest. The inside of their mouths appears as red as blood, and it gives their teeth a dark color but it preserves the teeth, sweetens the breath, and is a stomachic and diuretic This palm is very generally cultivated in the East Indies.

A oleracea is the highest of the American palms, and is very distinct from the East Indian Areca. The sheaths of the leaves are very close, and form the green top of the trunk a foot and a half in length. The

History, Use, Propagation, Culture,

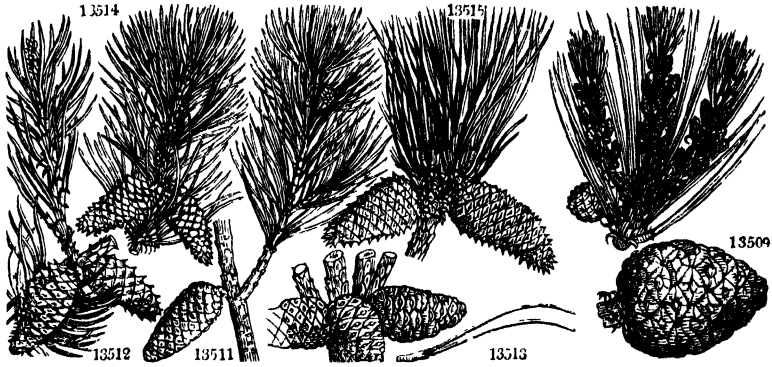
inhabitants cut off this top, take out the white heart of two or three inches in diameter, consisting of the leaves closely folded together, and eat it, either raw with pepper and salt, or fried with butter like the artichoke

2010 *Bellis* Named by R A Salisbury, in the Transactions of the Linnean Society, from βέλος, a javelin, on account of the form and texture of the leaves, which are not unlike a javelin head B lanceolata is a beautiful evergreen shrub, with distichous neat leaves, easily cultivated in any good conservatory.

2011 *Agathis* From ἀγαθὸς, a cluster, because the flowers are collected in clusters This genus is formed of the Dammar Pines, of which the A australis, or New Zealand Cowdie Pine, is one of the finest trees in the world, often growing perfectly straight to the height of 100 feet or more, and yielding one of best descriptions of wood for masts

2012 *Pinus* This name is of Celtic origin, and is the same in all the dialects of that tongue *Pin* or *pen*, a rock or mountain, has given rise to *pin*, in Armorican, *penge*, in Erse, *punua*, in Welsh, *pinu*, in Anglo-Saxon, *pine*, in English, *pynbaum*, in German, all signifying the fir-tree hence also the Appennines (Alpes penninæ), Pennafiel, Pennaflor, &c towns of Spain embosomed in mountains The fruit of P Pinea was formerly called Nux pinea, the pine nut Pinaster is Pliny's name for the wild pine Cembra is an alteration of the word *cembro* or *cirmolo*, the name given by the inhabitants of Trentin and Valteline to the plant Tæda is derived from the Greek δαὶς δαδὸς, which signifies a torch, for which the wood of P tæda is particularly adapted Strobus is a name employed by Pliny for an eastern tree, which was used to perfume apartments The moderns have applied it to a noble North American species

The trees which compose this genus are not less remarkable for their grandeur and beauty, than for their valuable timber They are all evergreens, and of lofty and erect growth The trunk of the Scotch pine is more generally employed and more universally applicable as timber than any other tree in the temperate zone of the northern hemisphere P sylvestris, *Pin*, Fr, *Kiefer* or *Föhre*, Ger, and *Pina*, Ital, is erroneously called a fir, and has the term Scotch applied to it, because it is the only species of the genus indigenous to Britain, and there only in the northern parts of Scotland. It is also indigenous in the Alps, in the north of Germany, Russia, and abundantly so in Sweden and Norway The finest pine woods in Britain, are at Invercauld in Inverness-shire, and Gordon Castle in Aberdeenshire The timber of the Scotch pine is the red or yellow deal of the north of Europe, and is the most durable and valuable of any of the genus, unless we except, in point of durability, the larch That grown in cold elevated situations in the highlands of Scotland, is found to be not inferior in quality to any imported from Norway, but that which has been planted in the low districts, is greatly inferior in point of durability, and can seldom be used in house carpentry and joinery The tree is of great value as a nurse plant to others less hardy The trunk of the tree produces resin by incision, and the roots tar by distillation Several varieties of the wild pine have been noticed by botanists. According to Sang, the variety commonly cultivated is least worth the trouble "The P sylvestris, v. r montana," he says, "is the variety which yields the red wood even young trees of this sort are said to become red in their wood and full of resin very soon The late Mr Don, of Forfar, exhibited specimens of cones of each variety to the Highland Society of Scotland, and likewise to the Caledonian Horticultural Society The variety preferred by Don, is distinguished by the disposition of its branches, which are remarkable for their horizontal direction, and for a tendency to bend downwards close to the trunk The leaves are broader and shorter than in the common kind, and are distinguishable at a distance by their much lighter and beautiful glaucous appearance.



13497 Fronds pinnated, Stems hirsute, Spadixes branched spiny, Spines incurved
13498 Fronds pinnated, Leaflets plaited bitten off, Stems and spadixes branched smooth, Fruit roundish gibbous

13499 Leaves solitary lanceolate flat spreading, Cones round, Scales acuminate

13500 Leaves elliptical lanceolate striated'

13501 Leaves ovate oblong smooth not striated

13502 Leaves in pairs rigid, Cones conico-ovate acute as long as the leaves, generally in pairs
13503 Leaves in pairs, Trunk ascending, Cones ovate erect
13504 Lvs twin very long of two forms, Cones ovate, Scales narrowed at base very thickened at end not angular
13505 Leaves twin short acute, Cones ovate conical, Prickles of scales long subulate incurved lower reflexed
13506 Leaves twin divaricating oblique, Cones recurved twisted, Crest of anthers dilated
13507 Leaves double or triple rigid, Cones oblong generally in pairs rounded at base
13508 Leaves twin roughish at edge, Cones oblong conical shorter than leaf narrowed at base, Scales echinate
13509 Leaves twin the first dilated, Cones ovate blunt somewhat unarmed longer than leaf, Nuts hard
13510 Leaves twin very fine, Cones ovate-conical very smooth solitary stalked
13511 Leaves twin, Cones ovate-conical rounded at base somewhat shorter than leaf, Scales blunt
13512 Leaves twin, Cones oblong-conical the length of leaves solitary rounded at base, Scales echinate
13513 Leaves twin, Cones ovate-conical rounded at base solitary half as short as leaves, Scales unarmed
13514 Leaves twin or ternate, Cones ovate-conical subsolitary, Prickles of scales incurved
13515 Leaves long, Cones deflexed spines inflexed, Sheath of leaves long
13516 Leaves in 5s very long slender lax toothletted, Cones cylindrical smooth pendulous longer than leaves
13517 Leaves 3 very long, Cones roundish ovate mucronate
13518 Leaves 3, Cones ovate clustered, Spines of scales reflexed, Sheath of leaves short

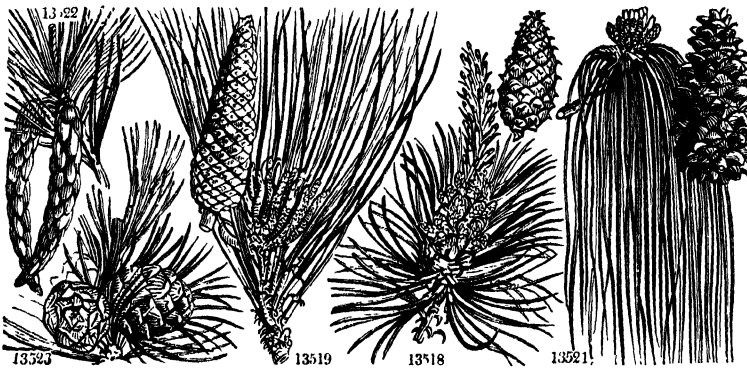
and Miscellaneous Particulars

The bark of the trunk is smoother than in the common kind The cones are thicker, and not so much pointed. The plant is more hardy than the common sort, grows freely in almost any soil or situation, and quickly arrives at a considerable size "

P laricio is said to be nearly allied to the Scotch pine, but a much handsomer and finer tree Professor Thouin considered it equally hardy with P sylvestris, its wood is more weighty and resinous, and consequently more compact, stronger, and flexible It grows wild on the summits of the highest mountains in Corsica P resinosa, the red Canadian pine, is not unlike the Scotch pine, but rather redder in the bark The timber of this tree is frequently imported as masts, and is considered valuable. Grown on a damp and fertile soil, it is much less durable than from elevated situations, it is equally hardy with P sylvestris P pinaster is a grand and picturesque tree, and is a great favorite with the Roman and Florentine painters The timber is of less value than that of any of the others that have been mentioned, in Switzerland it is cut into shingles for covering their houses It is highly deserving of culture as an ornamental tree, but not for timber

P Pinea is very common in the south of Italy, there is an immense forest of them at Ravenna, and they are much planted in the gardens of the villas of Rome and Florence The seeds of this and the last species are eaten throughout Italy, both by the poor and rich They are as sweet as almonds, but with a slight flavor of turpentine The wood is not so resinous as that of most of the other sorts, and the tree can only be considered as deserving culture for its pictorial effect P Cembra, the Tannenbaum of Lord Byron (Childe Harolde), and the Aphernoush pine of Harte (Essays), grows higher up the Alps than other pines, and is even found at elevations where the birch will not grow The wood is very soft, and having scarcely any grain, is very fit for the carver The peasants of the Tyrol, where this tree abounds, make various sorts of carved works with the wood, which they dispose of in Switzerland among the common people, who are fond of the resinous smell which it exhales

P Tæda has longer leaves than the wild pine, and larger cones than P Pinea, the timber is like that of the Scotch pine, but has more resin There are a number of these trees at Woburn Abbey, which grow as freely as the Scotch pine, and the timber, as far as it has been tried, is superior



P palustris is remarkable for the length of its leaves, which often exceed a foot, and hang down in tufts at the end of the branches, having a singular appearance It grows in a warmer climate than most other pines, produces a valuable timber in America, but has been but little cultivated in this country P strobus forms the connecting link between the pine and the larch tribe, and is the tallest tree of the genus The bark is smooth and elegant, and the leaves numerous, soft, and of a bluish green The timber is imported in vast quantities under the name of white pine, it is much used in house carpentry, but is considered less durable than the red deal of Norway (P sylvestris), or the pitch pine of Canada (P resinosa) The tree seems to be of so delicate a habit, as to prevent our expecting it ever to become very large or valuable in Britain It has been a good deal cultivated, having formerly been supposed the most valuable tree of the genus, next to the common pine

The Pinus canariensis seems never to have been well described or understood Some have taken it for the Pinus Larix, others for the Pinus tæda, whilst others had confounded it with the Pinus maritima Von Buch, and the late Christian Smith, named it in their catalogue of the vegetation of Teneriff, Pinus canariensis, and they state, that it inhabits that island from the edge of the sea to an elevation of 6700 Parisian feet above the level of the sea, but that the region where it is most abundant may be reckoned at from 4080

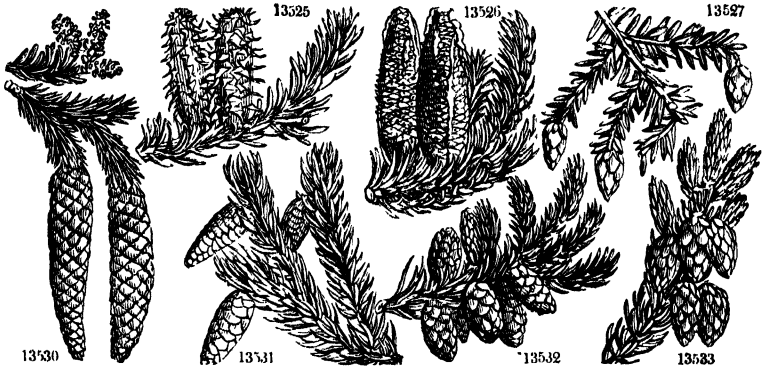
History, Use, Propagation, Culture,

to 5900 feet, where snow falls for about a month The temperature of the zone M Decandolle estimates to be similar to that of Scotland, or to the north of France, or of Germany. The wood is resinous, highly inflammable, and is excellent for constructing buildings, being known to continue sound for ages

The Pinus inops, Jersey pine, pitch or scrub pine, is of middle size, straggling growth, and full of resin Its branches are tougher than those of any other pine, and might be used for many purposes if its wood were not subject to so early a decay The pitch pine, P resinosa, is generally known in its native country by the name of Norway pine, sometimes, particularly among the Canadian French, red pine It grows in close forests, is very tall, and its bark remarkably smooth and red the timber is very heavy, for which reason it is rejected for masts, though its shape and size appear to recommend it for that purpose The scrub pine, P Banksiana, is a small straggling tree, which in some instances, when growing among barren rocks, does not rise above five or eight feet high, though it will grow to a considerable size when by accident or culture it is brought on good soil trees of this species now in England exude a great quantity of resin from their branches The yellow pine, P. variabilis, is most in use for building houses, as well as shipping P tæda, the loblolly or Oldfield pine, is found in large tracts in the southern states of North America all the woods seem to be filled with its seeds, for when any piece of cleared land is neglected for any space of time, it will be covered with these pines It is difficult, and in some cases almost impracticable, to recover lands so run over, as the ground appears to have lost all fertile properties for other vegetation The long leaved, yellow, pitch, or brown pine, P palustris, is a beautiful as well as very useful tree The white or Weymouth pine grows in the state of Vermont to an enormous size, it is the best timber in America for masts.

2013 *Abies* According to Bullet, this name is derived from one of the dialects of the Celtic, *abetoa*, whence *abete*, Italian, *abeto*, Spanish, &c Hesychius, the Greek grammarian, calls it ἄβιν



Abies communis, *Sapin*, Fr, *Fuchtenbaum*, Ger, and *Abiete*, Ital, is one of the tallest of European firs, with a very straight but not thick trunk It is a native of the north of Germany and Russia, and particularly abundant in Norway, its timber being the white deal, and, at an earlier age, the long spars imported from that country and the Baltic The timber is inferior to that of the common pine in durability and bulk, and being often knotty, is not proportionally strong for horizontal bearings with that timber White Norway deal, however, is used for a great variety of purposes in building, and the entire trees are more prized than any other for masts for small craft, for spars both for marine purposes and on land What constitutes the value of this fir is, that its timber is equally durable at any age, like that of the larch, and what renders it peculiarly adapted for masts, spars, scaffolding, poles, &c is its habit, almost in every case, whether standing single or detached, of growing perfectly erect and straight The tree may be cut for rods, stakes, and scythes, or other implement handles, when the trunk at the base is not more than two inches in diameter, and the bark being kept on it, it will prove almost as durable as the larch Pontey says, that poles of spruce are so far inferior to those of larch, that they are more apt to crack when exposed whole to the influence of the sun and air, but in all other respects they are nearly equal to it, and in straightness surpass it The tree is peculiarly valuable as a nurse, from being evergreen and closely covered with branches, by which radiated heat is retained, from its conical shape and rigid stem, by which it does not suffocate or whip the adjoining trees, from its being valuable at whatever age it is thinned out, and from its being an excellent shelter for the most valuable game It will not, however, grow in elevated situations, where the common pine and larch will flourish It is also an excellent hedge plant for shelter, but is deficient in point of defence and durability By incision, it yields a resin, from which, by various preparations, turpentine and Burgundy pitch are formed The tops or sprouts give the flavor to what is called spruce beer

A alba, rubra, and nigra, are American firs of the spruce kind, resembling in their general properties those of Europe The black spruce is reckoned the most durable in America it is used for knees for ship-building, where neither oak nor larch can be easily obtained These knees are not prepared from two diverging branches, as in the oak, but from a portion of the base of the trunk connected with one of the largest diverging roots The timber of the red spruce is universally preferred throughout the United States for sail yards, and, indeed, imported for this purpose into Liverpool from Nova Scotia, where it is also used for constructing casks for salted fish It is chiefly from the decoction in water of young shoots of the black spruce, and not exclusively from those of the white species, as supposed by Lambert, that the celebrated beer is prepared by fermentation, with a due proportion of sugar and molasses. The essence of spruce of the dealers is prepared by evaporating this decoction to the consistence of honey

A picea displays a more stable and majestic form than any of the firs The upper surface of the leaves is of a fine vivid green, and their under surface has two white lines running lengthwise on each side of the

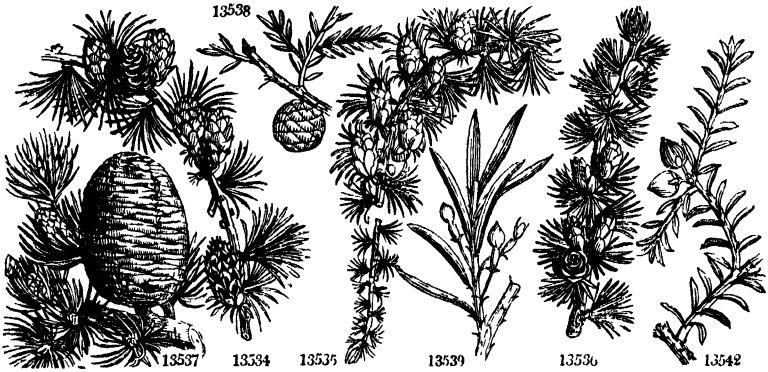
13519 Leaves 3 very long, Cones subcylindrical muricated, Stipules pinnatifid ragged persistent
13520 Lvs very fine and slender of a bright glaucous green, Cones oblong pendulous Scales obtuse spreading
13521 Leaves 3 very fine very long, Sheath long, Stipules entire deciduous, Crest of anthers convex entire
13522 Leaves quinate, Cones cylindrical longer than leaf lax
13523 Leaves quinate, Cones ovate obtuse, Scales appressed, Nuts hard

13524 Leaves solitary glaucous beneath emarginate, Cones ovate obl erect, Bractes oblong reflexed emarginate
13525 Leaves solitary flat emarginate pectinate, Scales of cone very blunt appressed
13526 Leaves solitary flat emarginate subpectinate suberect above, Scales of the cone in fl acuminate reflexed
13527 Leaves solitary flat toothletted somewhat distichous, Cones ovate terminal scarcely longer than leaf
13528 Leaves solitary 4 cornered, Cones ovate cylindrical, Scales rhomboid
13529 This is a stunted variety of Abies communis
13530 Leaves solitary 4-cornered, Cones cylindrical, Scales rhomboid flattened repand at end eroded
13531 Leaves solitary 4-cornered incurved, Cones subcylindrical lax, Scales obovate entire

and Miscellaneous Particulars

midrib, giving the leaves that silvery look which has given rise to the name The timber is reckoned much inferior in value to that of the common pine, or of the white spruce It should not be cut till after forty or fifty years growth, at this age, if it has grown in a sheltered rocky steep or dell, it will be found to have produced a great bulk of timber It is more prolific in resinous matter than any other tree of the fir kind

A balsamea is a tree of more delicate habits than the silver fir its timber is of little value, and the balm or resin procured from it possesses no medical properties superior to those of common turpentine During summer, the tree sends out a pleasing terebinthinate odor



A canadensis is a drooping low evergreen tree, elegant in appearance, and valuable as growing under the shade or drip of other trees

All the species of the pine, fir, and larch families, with the exception of one or two, as yet rare in this country, are raised from seeds The cones are gathered in the winter season, and exposed to the sun, or to a gentle heat on a kiln, in order to facilitate the separation of the seeds The cones of the cedar should be kept for a year at least after they are taken from the tree, before the seed be attempted to be taken out This is necessary on account of the soft nature of the seeds, and the great quantity of resinous matter which the cones contain when growing, and which is discharged by keeping Cedar cones are generally imported from the Levant, and the seeds retain their vegetative powers for many years The cones of the Scotch pine, spruce, and larch, are the principal kinds which are opened by kiln heat The cones of the Weymouth pine, silver fir, and balm of Gilead fir, give out their seeds with very little trouble April is the best season for sowing all the species The soil should be soft and rich, well mellowed by the preceding winter's frost and snow, carefully dug and raked with a long toothed rake as finely as possible The rarer sorts are generally sown in pots, but the more common in beds The manner of sowing is by first drawing off the surface of the bed to the depth of half an inch, then drawing a light roller along it to render the surface perfectly even, next depositing the seed, and afterwards replacing the earth drawn off with a spade as evenly as possible This is what is technically called bedding in, and is one of the nicest operations of nursery culture The seed of the Scotch pine and Pinaster require a covering of half an inch in depth, those of the Weymouth pine, three quarters of an inch, and those of the stone pine, an inch and a quarter The Cedar is generally sown in broad pots, or boxes of light sandy loam, and covered half an inch The seeds of the larch require a covering of only a quarter of an inch, those of the spruce fir, an inch, those of the silver fir and balm of Gilead fir, from half to three quarters of an inch The seeds of the American spruce fir are smaller than those of any of the preceding kinds, and therefore require a lighter covering than any of them, one-fifth of an inch is quite sufficient The strictest attention is required, both in regard to quality of soil, and thickness of covering the seed, for though resinous trees are extremely hardy when grown up yet they are all very tender in infancy In sowing the seed, a considerable loss will be sustained by the suffocation of young plants if it is deposited too thick, and by the want of plants if too thin The judicious gardener will be regulated by the goodness of the seed, and the size of the foliage of the different species The raising regular crops of the pine family is reckoned a master piece of nursery culture in the open ground, and as it has been most extensively practised in the Scotch nurseries, it is generally considered as best understood there (See *Sang Plant Kal*)

The pine, fir, and larch families benefit less by transplanting in the nursery than the non-resinous trees And in general, where circumstances admit, the better plan is to remove them at once from the seed-bed at two years old, to where they are finally to remain The more delicate species, including the cedar and most of the pines, are best transplanted into pots, unless they can be placed at once where they are to remain The more common pines and firs are transplanted at two years of age into nursery lines, about the middle of April for all the tribe, excepting the larch, which, being deciduous, should be transplanted in February No description of tree-plants receive so much injury as this tribe from the loss of roots, from the roots being exposed to the air by being kept long out of the soil, or from compression and exclusion of air and moisture by being kept in close bundles, or thick layers They should, therefore, be finally planted as soon as possible after removal from the nursery, and, indeed, whenever it is practicable, no more should be taken up in one day than can be planted that day or the next Nor are any plants more easily deprived of the vital principle, by packing and carriage either by sea or land, though, being all evergreens, excepting the larch, they do not readily show it. This has been stated to us by experienced planters in Wales and different parts of England, as the reason why so few trees are finally produced from the immense numbers of Scotch pine and larch fir annually sent to the south by the Scotch nurserymen

Abies Balsamea forms an elegant tree forty or fifty feet high It grows in high and cold situations in the northern states of North America, where it is called balsam of Gilead fir, fir balsam, and American silver fir

History, Use, Propagation, Culture,

The hemlock spruce is a very elegant tree, and grows in some situations to an enormous size its bark is a fine substitute for oak-bark in tanning

2014 *Larix* This has also for its root the Celtic word *lar*, which signifies fat, in allusion to the abundance of resin afforded by the plant Even Dioscorides remarks, that *Larix* is the Gallic name for resin. The authors of the Dictionary of Trevoux make the word Cedrus come from *κεδρος*, sweet-scented, on account of the balsamic odor exhaled by the wood when burned

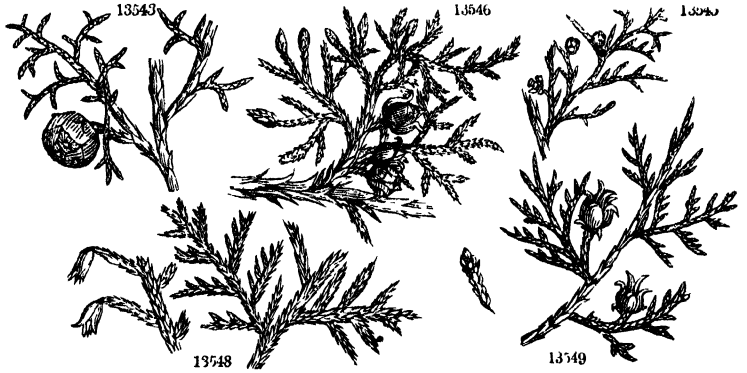
L. Cedrus, *Cédre*, Fr, *Cedrbaum*, Ger, and *Cedro*, Ital, is unquestionably the most celebrated tree of the genus, and not less remarkable for the irregular grandeur of its form The general character of its shoot, even when the tree is young, is singularly bold and picturesque, and quite different from that of every other species of the tribe It is a native of the coldest parts of the mountains of Libanus, Amanus, and Taurus, but it is not now to be found in those places in great numbers Maundrell, in his journey from Aleppo to Jerusalem, in 1696, could reckon only sixteen large trees, though many small ones, one of the largest was twelve yards six inches in the spread of its boughs The forest of Libanus never seems to have recovered the havoc made by Solomon's forty score thousand hewers so that we have now, as Professor Martyn observes, probably more cedars in England than there are in Palestine

From the branchy head of this tree, and its aversion to pruning, it is not likely ever to become valuable as timber in this country When planted for that purpose, it should, as Sang recommends, be sown in groves, and thus by proximity drawn up with few branches Much has been said of cedar timber, which borders on the miraculous, as far as experience has gone, it is greatly inferior to that of the common larch, or the wild pine The great use of the cedar is to plant singly on lawns, or in the margin of plantations, where one or two specimens will give force and character to the dullest front of round-headed trees

L. Communis, *Melezo*, Fr, *Lerchenbaum*, Ger, and *Laricio*, Ital, is a deciduous tree, and there are two or three species or varieties not yet distinctly ascertained There is a variety with red and another with white flowers, one with cinereous bark, called the Russian larch, and one with pendulous branches L. pendula and L. microcarpa are considered species or subspecies, the timber of both is said to be harder than that of the common white larch, but these trees have never yet had a fair trial in this country As there are a few large specimens at Dunkeld and Athol, seeds will probably soon be obtained, and from their progeny a practical estimate may be formed of their merits in this country The red larch trees on the Athol estates do not contain one-third as many cubic feet of timber as the white larch of the same age The wood is so ponderous that it will scarcely swim on water. (*Hort Trans* iv 416) The timber of the white larch has been as much extolled as that of the cedar, and with much more reason The rapidity of its growth is not less remarkable than the durability of the timber. Both have been experimentally proved in the Highlands of Scotland It is stated by the Duke of Athol, that on mountainous tracts there, at an elevation of 1500 or 1600 feet, the larch, at eighty years of age, has arrived at a size to produce six loads (600 cubic feet) of timber, appearing in durability and every other quality to be likely to answer every purpose both of civil and naval architecture (*Hort Trans* iv 416) The tree will arrive at a timber size in almost any situation or soil Sang, a forest manager of extensive practice, has paid great attention to this tree "It bears," he says, "the ascendancy over the Scotch pine in the following important circumstances that it brings double the price, at least, per measureable foot, that it will arrive at a useful timber size in one-half, or a third part of the time, in general, which the pine requires, and, above all, that the timber of the larch, at thirty or forty years old,

13532 Leaves solitary subulate, Cones oblong blunt, Scales rounded somewhat 2-lobed entire at edge
13533 Leaves solitary 4-cornered erect straight, Cones ovate, Scales elliptical wavy at edge erect

13534 Leaves fascicled deciduous, Cones ovate-oblong, Edges of scales reflexed lacerated, Bractes panduriform
13535 Leaves fascicled deciduous, Cones oblong, Edges of scales inflexed, Bractes panduriform sharply acumin
13536 Leaves fascicled deciduous, Cones roundish few-fl Scales reflexed, Bractes panduriform bluntly acuminate
13537 Leaves fascicled rigid evergreen acute, Cones roundish, Scales truncate appressed



13538 Leaves distichous spreading

13539 Leaves solitary lanceolate remote

13544 Branches quadrang Lvs imbric in 4 rows appr glauc keel Cones subglob. Sc mucron Branches pendulous
13545 Branches compressed, Leaves imbricated 4 ways ovate warted at base
13546 Leaves linear much spreading decussate
13547 Leaves linear crossing appressed, Branches very slender

13548 Branches 2-edged, Leaves imbricated in 4 rows ovate rhomboid appressed naked warted, Cones obovate
13549 Branches 2-edged, Lvs imbricat in 4 rows ovate rhomboid appressed furrowed in middle, Cones elliptical

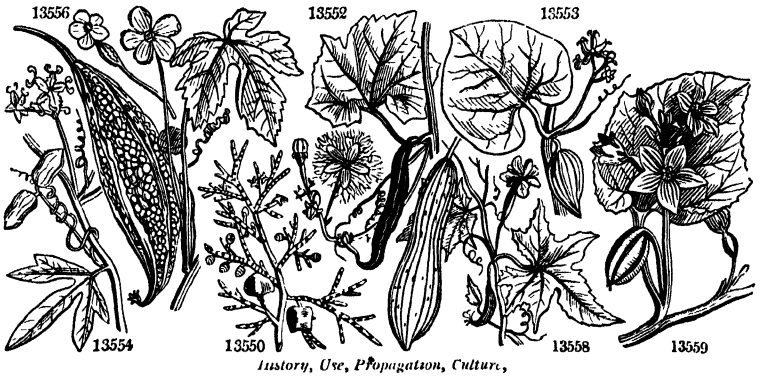
and Miscellaneous Particulars

when it has been planted in a soil and climate adapted to the production of perfect timber, is in every respect superior in quality to that of the pine at 100 years old In short, it is probable, that the larch will supersede the Scotch pine in most situations in this island, at no very distant period"

The chief objections to the timber of the larch are its liability to warp and twist, but this Monteath and others have proved may be effectually prevented by barking the trees in spring while growing, and not cutting them down till the following autumn, or even for a year afterwards This is also said to prevent the timber from being attacked by the dry rot The bark of the larch is more than half as valuable as that of the oak in tanning, turpentine is extracted from it in the Tyrol by incision, but that being always injurious to the timber, can never be recommended for adoption in this country (See *Encyc of Gard* 7053 *Monteath's Forester's Guide*, 2d edit p 234)

Like all other trees, and especially the resinous tribe, the timber of the larch is much affected by climate and soil A certain elevation of surface, coldness of climate, and inferiority of soil, is absolutely necessary to produce the timber in perfection Sang has known it in many places make the most rapid progress for thirty or thirty-five years, and though there was no external signs of disorder, yet when it was felled, the wood had begun to rot in the hearts of the trees, and some were quite hollow a good way upwards (*Plant Kal* 59)

Larix pendula, black larch, *Tamarack* or *Hackmatack* of the Americans, is a beautiful tree, resembling the European larch in appearance, as well as in the excellent qualities of its wood and bark



2015 *Schubertia* Named in honor of M Schubert, a Polish botanist The deciduous cypress grows in extensive swamps, and on the banks of large rivers, from Indian river, Delaware, to Florida, and on the Mississipi, it is one of the largest trees of the new continent, and one of the most valuable timbers that country produces, it grows to a considerable height in this country, though the extremities of the young shoots are almost every autumn destroyed by frost The finest specimens are at Sion-house and Blenheim

2016 *Podocarpus* From πους ποδος, a foot, and καρπος, fruit, in allusion to the stalk of the fruit. The species are increased by ripened cuttings in sand under a hand-glass

2017 *Cupressus* In Greek κυπαρισσος, from the isle of Cyprus, where this tree is very abundant. Cupressus sempervirens is a common timber tree in some parts of the Levant It was employed by the Moors round their palaces, and both by the ancient and modern Romans in their villas and gardens The timber of this tree is said to resist the worm, and to be of great durability The doors of St Peter's church at Rome were formed of this material, and have lasted eleven hundred years The Greeks made their coffins of it, and the mummy chests of Egypt are many of them of this wood In Crete, Malta, and other places, it is used for the common purposes of building, and when imported into this country it is employed by the cabinet-maker and turner Near buildings, where the prevailing architectural lines are horizontal, it forms very suitable combinations it is also considered an appropriate tree for burial places C Thyoides is an abundant tree in the swamps of New Jersey and Pennsylvania It is used for fencing and house-building, and is in the highest esteem for shingles and pipe staves C lusitanica is a native both of Goa and Japan, and the handsomest tree of the genus It is easily distinguished from all the evergreens of the Coniferæ by its abundance of very long dichotomous pendent branchlets The culture of the hardy species of this genus, and also of Thuja, is the same as that of Pinus

2018 *Thuja* An alteration of *thya*, its real name, from θυω, to sacrifice Its wood, which gives out when burnt an agreeable perfume, was used in sacrifices. Thuja occidentalis, *Cédre blanc*, Fr, is a well known

History, Use, Propagation, Culture,

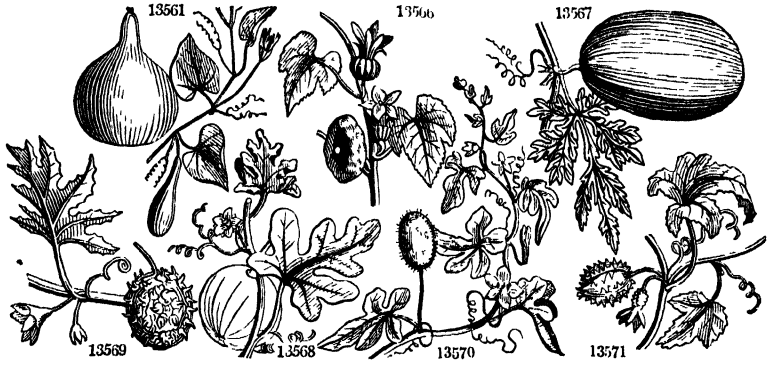
popular evergreen, which, though it seldom rises above the height of a shrub here, yet in Upper Canada attains the height of a timber tree, and the wood is considered more durable than any other The trunk is sawn up into planks and boards for houses and boat-building, and the branches used for posts and fencing The smaller branches and spray form besoms, and the leaves, made into a salve, are used by the Indians to cure the rheumatism In England, the timber has been chiefly employed by the turner and cabinet-maker In its native country the Arbor-vitæ succeeds best in soils where the roots have abundance of moisture It grows tallest in swamps and marshes, in very dry places it never comes to any degree of perfection The first tree of this species sent to Europe, was planted in the royal garden of Fontainbleau, in the reign of Francis the first. T orientalis is a shrub resembling the other in general appearance Both these species are readily increased by seeds, cuttings, or layers

2019 *Trichosanthes* From θριξ, hair, and ανθος, a flower The limb of the flower is divided into ten parts, of which the five outer are reversed and acute, the five interior ciliated T Anguina is a popular annual, with the habit of the common cucumber The flowers are cut into many small threads, and the fruit is taper, and nearly a foot long T cucumerina has smooth fruit of a red or orange color, the size of a pear In the popular medicine of Malabar, the seeds are used for disorders of the stomach and bowels Culture as for the common gourd

2020 *Momordica* From *mordeo, momordi*, to chew, its seeds have an irregular rugose surface, and the appearance of having been chewed M elaterium has a large fleshy perennial root, somewhat like that of Bryony The stems are thick, rough, trailing, branching, with rough leaves on long footstalks The fruit is an inch and a half in length, swelling like a cucumber, of a grey color like the leaves, and covered with short prickles When fully ripe, it quits the peduncles, and casts out the seed and juice with great force and to a considerable distance through the hole in the base, where the footstalk is inserted For medicinal use, the fruit is gathered in September, just before it is ripe, and the clear juice which runs from it and that obtained by the expression of the fruit are inspissated, and form the elaterium of the shops This fruit is a very violent cathartic It was much employed by the ancients, who regarded every part of the plant as purgative, but Dr. Clutterbuck has proved that this is an error (*Thomson's Lond Disp* 388.)

M balsamina has a fleshy ovate fruit, remotely tubercled in longitudinal rows, smooth in the other parts, red when ripe, bursting irregularly, and dispersing the seeds with a spring This fruit in Syria is famous for curing wounds They cut it open when unripe, and infuse it in sweet oil, exposed to the sun for some days, until the oil is become red It may then be applied to a fresh wound dropped on cotton M operculata has a green fruit, the top of which falls off when it is ripe like a lid, within it has no pulp, but is dry, and filled with netted fibres, very much interwoven

2021 *Cucurbita* A Latin word signifying a vessel It is said to be derived from the Celtic *cucc*, a hollow thing C lagenaria has a fruit shaped like a bottle, with a large roundish belly, and a neck very smooth, when ripe of a pale yellow color, some near six feet long and eighteen inches round, the rind becoming hard, and being dried contains water, seeds quadrangular oblong, cut off and emarginate at top, three-cornered and beaked at bottom, edge keeled with a double raised line, smoothish, of a pale bay color The Arabians call the bottle gourd *Charrah* The poor people eat it boiled, with vinegar, or fill the shell with rice and meat, and thus make a kind of pudding of it It grows in all parts of Egypt and in Arabia, wherever the mountains are covered with rich soil In Jamaica, the shells are generally used for water cups, and frequently serve for bottles among the negroes and poorer sort of white people in the country A decoction of the leaves



13550 Branches compressed, Lvs imbricated in 4 rows lanc acute appressed warted under end, Cones 4-cornered
13551 Branches round, Leaves imbricated in 4 rows oblong appressed smooth, Cones 4-cornered roundish

13552 Fruit rounded oblong incurved, Leaves cordate repand mucronate toothletted
13553 Fruit ovate acute, Leaves roundish cordate angular repand
13554 Fruit oblong acute, Leaves 5-lobed palmated entire

13555 Fruit roundish ovate narrowed at each end angul warted, Bract cordate toothed above midd of pedunc
13556 Fruit oblong acuminate angular warted, Bract cordate entire below the middle of the peduncle
13557 Fruit elliptical angular warted beaked, Beak deciduous forming a lid
13558 Fruit cylindrical oblong, furrows chain-like, Bract cordate entire at the base of the peduncle
13559 Fruit elliptical hispid, Leaves cordate hispid blunt toothed, Stem without tendrils

13560 Leaves cordate angular 5-lobed toothletted downy, Fruit obovate striped with lines lengthwise
13561 Leaves cordate roundish obtuse downy toothletted with 2 glands at base beneath, Fruit woody clavate
13562 Leaves subcordate about 3-lobed cuspidate finely toothletted rough, Fruit globose smooth
13563 Leaves cordate obtuse about 5-lobed toothletted, Fruit roundish or oblong smooth
13564 Leaves cordate deeply 5-lobed the middle lobe narrowed at base, Fruit roundish elliptical warted
13565 Leaves cordate deeply 5-lobed middle lobe narrowed at base toothletted, Fruit clav ellipt somew warted
13566 Leaves cordate obtuse about 5-lobed toothletted, Fruit depressed umbonate tumid at edge
13567 Leaves 5-lobed, Lobes sinuate pinnatifid blunt, Fruit elliptical smooth

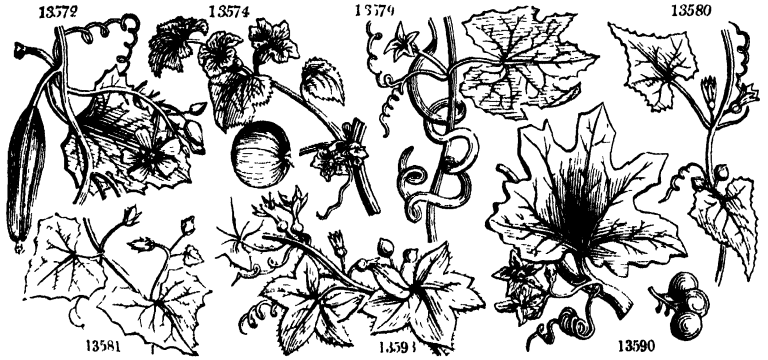
13568 Leaves multifid, Fruit globose smooth
13569 Leaves cordate 5-lobed toothletted blunt, Fruit globose spiny muricated
13570 Leaves palmate sinuated, Fruit round echinate
13571 Fruit oval echinate, Leaves palmate sinuated, Stem angular

and Miscellaneous Particulars

is recommended much in purging clysters, and the pulp of the fruit is often employed in resolutive poultices: it is bitter and purgative, and may be used instead of Coloquintida

C. pepo, *Pattison* Fr., has hispid branchy tendril stems, which in good soil will extend forty or fifty feet in a season, and cover an eighth part of an acre. The fruit is oblong, ovate, varying in form and size, some not less than four feet in circumference. In some parts of England the pompion (corruptly pumpkin) is sometimes planted by cottagers on dunghills, and suffered to trail at length over the grass of an orchard. When the fruit is ripe, they cut a hole on one side, and having taken out the seeds, fill the void space with sliced apples, adding a little sugar and spice, and then, having baked the whole, eat it with butter, under the name of pumpkin pie. On the continent the fruit, both unripe and ripe, is used in soups, stews, and fried in oil or butter. The tender tops of the shoots boiled as greens are much more delicate than the fruit. C. aurantia is more tender than the common pompion. The fruit is small, round, of a bright yellow when ripe, and may be used like those of the other species. C. verrucosa has a small round fruit, with a woody rind. In America it is gathered when half grown, and boiled to eat as a substitute for greens, but for this purpose this and most of the species are inferior to the succade Gourd.

C. melopepo, *Patiron*, Fr., *Pfeifen Kurbis*, Ger., and *Popone*, Ital., has a large fruit, reddish yellow or yellowish-white within and without, roundish, but often flatted at top and bottom, torulose, and sometimes warted. It is cultivated in America as a culinary vegetable. C. Citrullus, *Pastèque*, Fr., *Wassermelone*, Ger., and *Cocomero*, Ital., is readily distinguished from all the other species by its deeply cut leaves. The fruit is roundish, large, smooth, often a foot and a half in length, with a white icy flesh, streaked with dark red and black seeds. It is much cultivated in the warm countries of Europe, and also in Asia, Africa, and America, for its cooling quality. It serves the Egyptians for meat, drink, and physic. It is eaten in abundance during the season, which is from the beginning of May until the overflowing of the Nile, that is, to the end of July or beginning of August. It is the only medicine the common people use in ardent fevers. For this purpose they have a variety that is softer and more juicy than the common sort: when this is very ripe, or almost putrid, they collect the juice, and mix it with rose-water and a little sugar. This fruit should be eaten by Europeans with great caution, when taken in the heat of the day, whilst the body is warm, colics and other bad consequences often ensue, and it is well known that persons are much troubled with worms at the time this fruit is in season.



The Succade Gourd, a variety of C. ovifera, has an elliptic oblong pale-yellow fruit, by far the best for culinary purposes of any species of the genus. When very young, it is good fried with butter, when about half grown, it is excellent either boiled as a substitute for greens, or stewed in slices with rich sauce, when full grown, it is used for pies. Sabine, who has cultivated most species of Cucurbita, considers the vegetable marrow without a rival (*Hort. Trans.* vol. ii. 255.)

All the species may be raised on a hot-bed in April, and transferred to the open garden at the end of May, under a warm aspect and in a rich soil, or they may be sown in a trench filled with hot dung, where they are finally to remain. Their after culture is of the easiest description.

It is not very generally known, that the tender tops of all the species of the Cucurbita and Cucumis families, whose fruit may be eaten, when boiled form a very tender substitute for greens.

2022. *Cucumis*. A word with the same derivation as the last. C. Colocynthis has fruit the size and color of orange, the pulp light, spungy, and white, and most intolerably bitter. When ripe, it is peeled and dried in a stove, and in this state it is imported from the Mediterranean under the name of coloquintida. Medicinally, it

History, Use, Propagation, Culture,

is a very powerful drastic cathartic, requiring to be employed with caution, on account of its violent effects When given alone, even in moderate doses, it purges vehemently, producing violent gripings, bloody ejections, and not unfrequently convulsions and inflammations of the bowels (*Thom Lond Dis* p 271)

C. **sativus** and Melo (μῆλον, an apple) are too well known to require farther notice in a work of this description. C anguria has hispid angular stems, and small flowers like those of Bryony The fruit is of the size and shape of a pullet's egg, of a dark-green color, and prickly like a hedgehog It is eaten green, or with other herbs in soups in the West India Islands, and is esteemed an agreeable and wholesome ingredient C prophetarum has a striped fruit smaller than a melon, the odor nauseous, and the taste as bitter as Coloquintida The fruit of C acutangulus is very insipid, but in India is eaten boiled and pickled C Chate has a roundish fruit almost like that of the melon, the taste is somewhat sweet and cool, but not so cool as the water melon In Egypt it is eaten as the most pleasant fruit they have, and that from which delicate persons have least to apprehend The culture of all the species is similar to that of the common cucumber

2023 *Sicyos* Σικυος was one of the Greek names of the cucumber, from σικυος, unpleasant The species are trailing plants like those of Cucumis, but with much smaller fruits

2024. *Bryonia* From βρυω, to push or grow rapidly, in allusion to the manner of its growth B alba and dioica, differ in little else besides the color of the berries, and by some are considered one species Goats are

13572 Leaves roundish angular, Fruit with 10 acute angles
13573 Angles of leaves rounded, Fruit torulose
13574 Angles of leaves rounded, Fruit spherical with a retuse nipple
13575 Hirsute, Angles of leaves entire toothed, Fruit fusiform narrowed at each end hairy

13582 Leaves roundish-cordate with a recess 5-lobed toothed hairy viscid

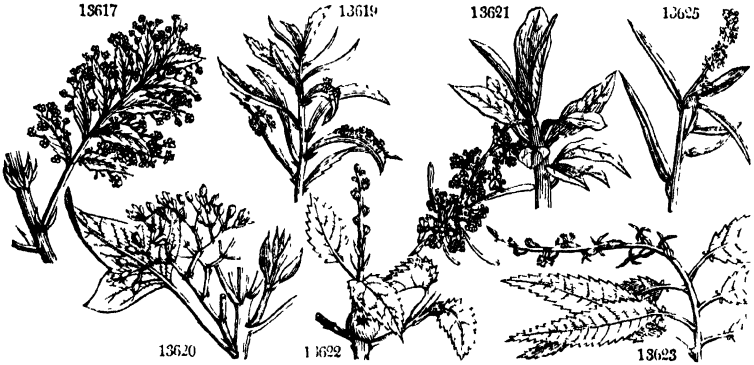
13583 Leaves cordate angular toothed rough with callous dots above and hairs beneath, Fl in umbels
13584 Leaves 3-lobed smooth above rough beneath
13585 Leaves cordate angular above and the veins beneath covered with callous dots, Tendrils simple
13586 Leaves cordate angular entire smooth with callous dots above and 5 glands at the base beneath
13587 Leaves 3-lobed rough toothed, Lateral lobes angular somewhat 2-lobed, Fl axillary somewhat umbellate
13588 Lvs 3-lobed toothed hispid on each side, Lat lobes dilated angular middle elong Stem muricato-hispid
13589 Leaves somewhat 3-lobed hairy narrowed at base
13590 Leaves cordate palmate 5-lobed toothed with callous dots, Fl racemose dicœcious
13591 Leaves cordate 5-lobed toothed rough with callous dots, Flowers racemose
13592 Leaves cordate 5-lobed apiculate hairy, Peduncles in umbels
13593 Leaves cordate 5-lobed entire with callous asperities on each side
13594 Leaves 5-lobed toothletted scabrous above, Peduncles 1-flowered
13595 Leaves 5-lobed somewhat toothletted, Lobes obtuse, Petioles and stem hispid
13596 Leaves palmate smooth 5-parted segments lanceolate repand serrated
13597 Leaves 5-parted palmate, Segm oblong lanc acuminate serrated, Petioles muricated, Peduncles 1-flowered
13598 Upper leaves 5 parted palmate, Segments oblong cut-toothed lower cordate angular toothed
13599 Lvs 5-parted palmate, Segm pinnatifid linear revolute at edge rough, Flowers in umbels, Berries acute

13600 Procumbent herbaceous

13601 Leaves sessile oblong blunt narrowed at base serrulate, Stem herbaceous
13602 Leaves petiolate lanceolate narrowed at each end entire, Stem shrubby
13603 Leaves stalked rhomboid acuminate entire, Stem arborescent

13604 Leaves obovate bluntish, Flowers twin axillary stalked, Stem branched round erect
13605 Leaves lanceolate cuneate blunt mucronate, Flowers solitary stalked axillary, Stem shrubby branched
13606 Leaves ovate-oblong blunt mucronate, Flowers axillary in threes, Branches compressed 3-cornered
13607 Leaves elliptical ovate blunt narrowed at base, Fls axillary aggregate dicœcious, Branches square compr
13608 Leaves simple orbicular-ovate lucid, Flowers axillary · male turbinate nodding
13609 Leaves oblong obtuse netted with red veins beneath, Flowers racemose and fasciculate
13610 Leaves elliptical acute at each end, Stipules ovate acute as long as petiole, Flowers fascicled
13611 Lvs pinn flower-bearing leaflets oblong attenuated at base and narrower on one side, Fls axill aggreg
13612 Lvs ovate acute, Fls axill somew umbelled, Pedunc filiform with 2 bractes at base, Branchlets compr
13613 Leaves lanceolate acute, Flowers terminal about 3, Branches pinnæform 2-edged
13614 Lvs pinn fl bearing leaf elliptical obtuse, Pedunc axill lower usually twin and male, upp solit fem
13615 Lvs pinn fl bearing leaflets linear obtuse mucronate, Flowers axillary solitary, the female uppermost
13616 Leaves pinnate fl bearing leaflets linear sharpish, Flowers axillary clustered, Petioles round downy

and Miscellaneous Particulars



the only quadrupeds said to eat this plant The root grows to a vast size Gerarde says, "the queene's chiefe chirurgeon, Master William Goodorous, shewed me a roote hereof, that waied halfe an hundred waighte, and of the bignesse of a childe of a yeere old" To this Linnæus ascribes the quickness of its growth, though it springs late The roots have been formerly by impostors brought into an human shape, carried about the country, and shewn for mandrakes to the common people The method which these people practised, was to open the earth round a young thriving Bryony plant, being careful not to disturb the lower fibres of the root, to fix a mould such as is used by those who make plaster figures close to the root, fastening it with wire to keep it in its proper situation, and then to fill in the earth about the root, leaving it to grow to the shape of the mould, which is effected in one summer. This root is a famous hydragogue, and highly purgative and acrid

2025 *Andrachne* The Greek name of the Purslane The modern plant bears some analogy to that of the Greeks, in its thick and fleshy leaf Plants of little beauty, and the easiest culture.

2026 *Stillingia* Named after Dr Benjamin Stillingfleet, an English botanist S Sebifera is the tallow-tree of China An oil is expressed from the kernel, which hardens by cold to the consistence of common tallow, and by boiling becomes as hard as bees' wax Stillingia sylvatica is considered a specific in cases of syphilis

2027 *Phyllanthus.* From φυλλον, a leaf, and ανθος, a flower, because the flowers grow upon the edges of the

History, Use, Propagation, Culture,

leaves Many of the species of this genus are remarkable for the neatness of their foliage and general aspect The abolished genus Xylophylla, which is now included in Phyllanthus, is very generally cultivated on account of the pretty and at the same time singular appearance of its leafless leaf-like branches, covered over at the edges with multitudes of pink flowers All the species require common stove culture

2028 *Aleurites* From αλευρον, flour, all the parts of the plant seeming to be dusted with a farinaceous substance A handsome plant of easy culture, and ripe cuttings with their leaves untouched, root in sand under a hand glass

2029 *Omphalea* A curtailment of Omphalandria, a name under which Dr Patrick Browne, in his History of Jamaica, first described the plant He formed it from ομφαλος, a navel, and ανηρ, a stamen, because the male organs are collected in a fleshy navel-like mass occupying the centre of the flowers. It grows freely in light loamy soil, and cuttings, with their leaves uninjured, root in sand under a hand-glass

2030 *Hippomane* From ἱππος, a horse, and μανια, madness, the name was given by the Greeks to a plant which grew in Arcadia, and which possessed the dangerous property of making horses furious This Hippomane must not, however, be confounded with that of Virgil (third Georgic), which is an animal substance

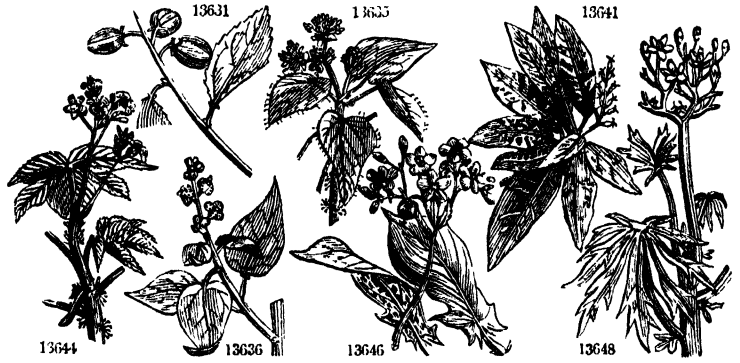
The Manchineel-tree grows to a vast size on the sea coast of the Caribbee Islands and neighbouring continent The leaves are ovate, serrated, acute, and very shining The fruit fall off from the tree spontaneously, and pave all the ground with their numbers They are highly poisonous, and are said to be eaten by the sea-crabs, which collect about the trees in vast numbers But this is supposed by Jacquin to be a vulgar error. The whole tree abounds with a white milk, which is highly poisonous, and so very caustic, that a single drop placed upon the skin instantly causes the sensation of a hot iron, and in a short space raises a blister It is a common belief that to sleep beneath the branches is death, but Jacquin and his companions reposed under it for three hours at a time without inconvenience The wood is a most beautiful material for furniture, being finely variegated with brown and white, and susceptible of a high polish. The workmen who fell the trees, first kindle a fire around the stem, by which means the juice becomes so much inspissated as not to follow the blows of their axes Whole woods on the sea-coast of Martinique have been burnt, in order to clear the country of such a dangerous pest

13617 Leaves pinnate lanceolate acuminate subcrenate coriaceous, Flowers stalked

13618 Leaves pinnate linear-lanceolate lined crenate, Flowers stalked hermaphrodite
13619 Leaves scattered linear-lanceolate subfalcate crenate, Flowers subsessile

13620 Leaves 3-lobed

13621 Leaves oblong blunt very smooth, Flowers triandrous, Stem arborescent



13622 Leaves ovato-serrated

13623 Leaves oblong acuminate serrulate, Petioles with 2 glands at the end

13624 Leaves lanceolate entire smooth variegated stalked
13625 Leaves linear entire stalked downy beneath
13626 Leaves elliptical entire bluntish hoary downy beneath stalked, Spikes terminal few-flowered
13627 Leaves ovate lanceolate plaited serrated scabrous
13628 Leaves ovate bluntish entire smooth, Fruit stalked
13629 Leaves ovate rhomboid repand entire at base hoary on each side, Peduncles terminal about 3-fl
13630 Leaves ovate serrated at end hoary downy beneath, Stipules ciliated, Spikes terminal subcapitate bracteate
13631 Leaves ovate acuminate serrated smooth with 2 glands at base, Petioles shorter than leaf, Racemes term
13632 Leaves ovate acuminate entire smooth silvery with scales beneath Racemes comp axillary, Stem arborescent
13633 Leaves cordate ovate attenuate somewhat toothletted warted and green above, silvery and shining beneath
13634 Leaves cordate acuminate serrulate rough above downy beneath with 4 glands at the base
13635 Leaves round cordate acuminate glandular-ciliated downy beneath, A fascicle of stalked glands at base of leaves
13636 Leaves oblong subcordate serrulate scabrous downy beneath with 2 glands at the base, Raceme terminal
13637 Leaves ovate acute subcordate entire scabrous above downy beneath
13638 Leaves subcordate angular blunt repand scabrous downy beneath

13639 Leaves oblong subcordate scabrous downy beneath and with 2 glands at base, Branches densely downy
13640 Leaves 3-5-lobed serrated with hairy petioles, Stem herbaceous
13641 Leaves oblong-lanceolate obtuse at base variegated and stained with red, Spikes axillary suberect
13642 Downy, Leaves cordate roundish blunt repand greenish above hoary beneath

13643 Leaves palmate 7-lobed hispid beneath stinging lobes pinnatifid, Petiole with 1 gland at end
13644 Leaves cordate 5-lobed serrated fringed with glands, Branched glandular hairs in axillæ of leaves and petioles
13645 Leaves ovate acuminate entire very smooth, Racemes subcymose
13646 Leaves oblong subpanduriform acuminate entire angular at base with 2 teeth on each side
13647 Leaves cordate angular
13648 Leaves palmate 11-lobed smooth lobes pinnatifid cuneate, Stipules setaceous multifid

and Miscellaneous Particulars

2031 *Sapium* A name under which Pliny indicates a sort of pine, so named from the abundance of resin which it produces, from *sap*, fat or greasy in Celtic The Americans employ the juice of Sapium aucuparium as bird-lime, for catching parrots and other birds For this purpose they cut off a limb of the tree, and the next day collect the sap which has flowed out and become inspissated They call it *Mangle cautivo* The juice is also burned in lamps Cuttings root freely in sand under a hand-glass

2032 *Croton* The Greek name of a certain insect called *ricinus* by the Latins, which the fruit of Croton resembles

Croton Tiglium affords an oil used in medicine, which is so powerfully irritating, that a small drop placed upon the tongue, has the effect of exciting an irritation along the whole intestinal canal, which does not soon subside It is usually employed in mixture with oil of almonds, in order to weaken its too violent powers C. lineare in its general appearance resembles rosemary, and is called wild rosemary in Jamaica C tinctorium is used to dye both silk and wool of an elegant blue color, and the juice is used to color wines and jellies The substance for this purpose is called Turnsol, and is made of the juice which is lodged between the calyx and the seeds this, if rubbed on cloths, appears at first of a lively green, but soon changes to a blueish purple, if these cloths are put into water, and afterwards wrung, they will dye the water of a claret color, the rags thus dyed are brought to England, and sold in the druggists' shops by the name of Turnsol.

C Eleuteria furnishes the Cascarilla bark, which is chiefly imported from Eleutheria, one of the Bahama Islands It consists of pieces of about six or eight inches long, scarcely one-tenth of an inch thick, quilled, and covered with a thin whitish epidermis It has a pleasant spicy odor, and a bitter warm aromatic taste. It is very inflammable, and is easily distinguished from all other barks by emitting, when burnt and extinguished, a fragrant smell resembling that of musk Medically, this bark is a valuable carminative and tonic, and is an excellent adjunct to the Cinchona bark in fevers C lacciferum, a plant not yet in gardens, is one among several species on which the gum lac is said to be produced Some of the spines we are in possession of, are much admired for their variegated leaves all of them are freely propagated by cuttings with the leaves on, planted in sand, and plunged in moist heat under a hand-glass

History, Use, Propagation, Culture,

root, yields an excellent nutritious article of food when the juice has been expressed, which is a strong poison J gossypifolia is considered a beneficial plant in the West Indies, on account of the seeds, which are much relished by and very nourishing to poultry J Manihot, the Cassava of the West Indies, and the Mandioca and Tapioca of Brazil, formerly supplied the greater part of the nourishment of the natives of South America, and is now very generally cultivated there and in the West Indies. It yields an agreeable wholesome food, is of rapid growth, the roots arriving to perfection in about eight months, and it will thrive in any soil or situation The juice of the root is sweetish, and when swallowed, or when the root is eaten without preparation, it brings on convulsions, and occasions violent retching and purging It acts only on the nervous system, it produces no inflammation on the stomach, but the stomach of a man or other animal poisoned by it, appears to be contracted one half A little mint-water and salt of wormwood, timely administered, will prevent all bad consequences In preparing the roots for use as food, they are washed, scraped, and grated to a pulp this pulp is then pressed, and when dried is a powder resembling starch or flower fit for use It is generally baked as bread, and bears a considerable resemblance to that made from wheat flour The roots entire, or in a powdered state, form an article of considerable export from different parts of Brazil All the species thrive well in our stoves, and are increased by cuttings, which Sweet states, succeed best when stuck in the tan in a good heat

2034 *Ricinus.* A name with the same derivation as Croton, No 2052, which see R communis, though an annual and herbaceous plant in our gardens, becomes a tree in Africa of several years' standing In Candia it continues many years, and, according to Belon, requires a ladder to come at the seeds The seeds furnish the well known Castor-oil of medicine This oil is obtained both by coction and expression The former method is performed by tying up the seeds, previously decorticated and bruised, in a bag, which is suspended in boiling water, till all the oil is extracted and rises to the surface, when it is skimmed off Oil so obtained is apt to become rancid, and, therefore, the better mode is to subject the seeds to the press, in the same manner as is done with almonds to procure almond oil (See Amygdalus) The oil obtained is equal to one fourth of the weight of the seeds employed It is often adulterated with olive oil, linseed oil, and poppy oil The great value of castor oil as a purgative is the mildness and rapidity with which it operates It is peculiarly adapted for infants,

13649 Leaves undivided 3-5-lobed palmate entire glaucous beneath
13650 Leaves 5-lobed cordate toothed hispid stinging

13660 Leaves ovate deeply cordate equally serrate, Male catkin ovate

13661 Leaves ovate lanceolate, Capsules obovate
13662 Hermaphrodite, Leaves ovate entire, Flowers panicled decandrous, Caps smooth
13663 Leaves 5-lobed lobes acuminate, Calyxes campanulate, Caps ovate hispid
13664 Leaves palmate 5-lobed, Calyxes rotate reflexed
13665 Leaves digitate

13666 Leaves ovate simply veiny

13667 Female flowers at base of male spike, Involucre ovate acuminate toothed, Leaves obl lanc remotely toothed
13668 Fem fls at base of male spike, Involucre cordate toothed, Leaves subrhomboid ovate serrated entire at base
13669 Spikes axill male upwards female downw Involucre cordate acuminate with imbricated serratures ciliated
13670 Female flowers solitary or twin at base of the male spike, Involucre cordate serrate, Leaves rhomboid ovate
13671 Female flowers at base of the male spike without an involucre, Leaves roundish ovate subcordate serrated
13672 Spikes axill male above female below, Involucre smoothish serrated, Leaves ovate acum serr cuneate at base
13673 Female spike cylind solitary terminal, Involucre 3-parted awned ciliated, Leaves roundish-ovate acuminate
13674 Female flowers twin axillary, Involucres entire, Leaves ovate acuminate serrulate, Stem shrubby
13675 Flowers dioecious male spiked, female axillary, Involucre roundish entire, Leaves smooth lanc subcord
13676 Spikes male above, fem below, Involucre cuneiform toothed at edge, Styles multifid, Lvs obl subcord serr
13677 Spikes axillary male above, fem de below, Involucre cordate hispid, Leaves ovate acute hispid
13678 Male spikes axillary female at base, Involucre 0, Leaves ovate cordate acuminate serrated
13679 Spikes axillary erect, Female involucre cordate toothed very large, Leaves ovate-lanceolate serrated smooth
13680 Flowers dioecious spiked, Spikes axill Involucre of females cordate cut, Leaves obl lanceolate serrated smooth

13681 Leaves 3-lobed serrated lobes oblong serrated, Bractes 3-lobed ciliated, Petioles shorter than peduncle

and Miscellaneous Particulars.

women in childbed, and persons bed-ridden Sown in pots on heat early in the season, and transplanted as soon as the frosts are over into a mass of light rich soil, the plant makes one of the most magnificent of border annuals, often attaining the height of ten or twelve feet

2035 *Hura* Its American name Hura crepitans is a rapid growing tree. From the quickness of its vegetation, its parts are of so loose a texture, that a loud clap of thunder, or a sudden gust of wind, frequently causes the largest boughs to snap asunder The wood is only fit for joists and spars the sap of the leaves and bark is corrosive, and the seeds when roasted purge both upwards and downwards The species are propagated by large ripened cuttings, planted in sand, plunged in heat, and covered with a hand-glass Its fruit when ripe bursts with a loud crack, whence the specific name of crepitans, they are of a very elegant form, resembling a depressed sphere with many rounded ribs, arranged with the utmost symmetry

2036 *Sterculia* Sterculius was the god of the privy, from *stercus*, excrement. It has been well observed by a French author, that the Romans, in the madness of paganism, finished by deifying the most immodest objects and the most disgusting actions They had the gods Sterculius, Crepitus, Priapus, and the goddesses Cacu, Pertunda, &c &c The flowers of one species and the leaves of the other are highly fetid The species are lofty trees with large leaves, and some of them very showy flowers they all thrive in light loamy soil, and ripened cuttings, with their leaves on, root in sand, plunged in moist heat, and covered with a hand-glass The famous Cola nut of Guinea is the produce of S acuminata.

2037 *Brutera* Named in honor of Charles Louis L'Heritier de Brutelle, a distinguished French botanist, who was unfortunately assassinated in a street of Paris in 1800 He published many works, which will always have a high reputation for the excellence of their text, and the magnificence of their illustrations A fine tree, which may be treated like Sterculia.

2038 *Acalypha* A Greek name for the nettle, which this genus much resembles It is compounded of α, privative, καλος, beautiful, and αφη, touch Plants of no beauty and the easiest culture

2039 *Dalechampa* So called after James Dalechamp, a French botanist, born in 1513, died in 1588 He left a General History of Plants, and some commentaries upon Pliny May be treated as Plukenetia

2040 PLUKENE'TIA *W* PLUKENETIA *Euphorbiaceæ* *Sp* 1—5

History, Use, Propagation, Culture,

2040 *Plukenetia* Named after Leonard Plukenet, an English botanist, who published some valuable works, with an immense number of copperplates, of singular merit for their time The names of two of these works are so singular as to deserve explanation One was called Amaltheum botanicum This word in Greek, Αμαλθεια, was the name of the goat which suckled Jupiter As its milk was exquisite and abundant, the word came to signify, among the ancients, the symbol of richness and abundance. The famous library of Atticus was called Amaltheum, on account of the number and variety of the books which it contained. In

CLASS XXII. — DIŒCIA.

Male and female flowers upon different plants

To this class many of the observations made upon the last are equally applicable Like it, the genera would have been more conveniently distributed among previous classes. The genera it contains are chiefly trees, and many of them form the most valuable portion of the forests of all parts of the world

In Monandria is found the celebrated Pandanus or screw pine, which, with its strange spiral branches, constitutes one of the most singular features of the vegetation of the Isle of France Diandria contains the valuable Salix, Pentandria, the hop, the hemp, and the spinage The black Bryony, and various palms have a station in Hexandria, the poplar in Octandria, the Papaw and the Bonduc tree in Decandria Monadelphia is richly endowed with valuable trees, such as the yew, the Norfolk Island pine, the juniper, the nutmeg, and it also contains the wonderful pitcher-plant of China

2048. *Elegia.* Cal 6 unequal glumes Female Styles 3 Caps 6-celled. Seeds solitary.

13682 Angles of capsules compressed keeled

and Miscellaneous Particulars

this sense Plukenet applied it to a work in which a great variety of curious plants was assembled. The other work was called Almagestum This also came originally from the Greek Claudius Ptolomæus, an astronomer and mathematician, published about the middle of the second century a work on astronomy, called Συνταξις μαγιστη, which may be Englished "Great work" Ishac ben Honain translated it into Arabic at the beginning of the ninth century, by order of the Caliph Mahmoun, to its title he added the Arabic article *Al*, and so formed the word *Al-magesti* or *Almaghesti*

2049 *Phœnix* Cal 3-parted Petals 3 Ovary 1 Drupe ovate-oblong.
2050 *Stilago* Male Cal tubular, 3-4-toothed Cor. 0 Stamens 2-3 Female, an annular disk at the base of the ovary Stigmas 2, one bifid Drupe 1-seeded.
2051. *Osyris* Male Cal. 3-fid. Cor 0. Female Style 1 Stigma roundish Berry 1-celled

Order 4. TETRANDRIA  Stamens 4

2052 *Aulax* Male Flowers racemose Cal. 0 Petals 4, staminiferous. Female Stigma oblique Nut exserted, ventricose, bearded
2053 *Leucadendron.* Male. Flowers capitate Cal. 0 Petals 4, staminiferous. Female Stigma oblique Nut or samara 1-seeded, included in the scales of the cone
2054. *Viscum* Barren fl. Cal. 0 Petals 4, dilated at the base, connate, resembling a cal Anthers sessile, adnate with the petals Fertile fl. Cal submarginate Petals 4, dilated at the base Style 1 Drupe inferior, 1-seeded
2055 *Myrica* Barren fl Scales of the catkin concave Perianth. 0 Fertile fl Scales of the catkin concave Perianth 0 Styles 2 Drupe 1-celled, 1-seeded
2056 *Nageia* Cal 4-leaved. Cor 0 Style bifid Drupe 1-seeded
2057 *Shepherdia* Male flowers in a catkin, 8-androus Female racemose at the ends of the branches. Limb of calyx flat, regular, 4-parted Disk with 8 glands Fruit of Hippophae
2058 *Hippophae* Male flowers in a catkin, tetrandrous Female solitary in the axillæ of the leaves Calyx tubular, bifid at end, closed Disk 0 Fruit formed of a berried calyx and akenium
2059 *Broussonetia* Male A cylindrical catkin Cal 4-parted Female A globose catkin Cal tubular, 3-4-toothed Ovaries becoming fleshy, clavate, prominent Style lateral Seed 1, covered by the calyx
2060 *Schæffera* Cal 4-leaved Petals 4 or 0 Berry 2-celled Seeds solitary
2061 *Brucea* Male Cal 4-parted Petals 4 Disk 4-lobed Female Pericarps 4, 1-seeded
2062 *Anthospermum.* Male Cal 4-toothed Cor with a short tube, and 4-parted limb. Female. Ovary inferior Styles 2, reflexed Fruit bipartible
2063 *Trophis* Male Cal 0 Petals 4 Female Cal. 0 Cor 0 Style 2 parted Berry 1 seeded
2064 *Montinia.* Male Cal 4-toothed Petals 4 Female Style bifid Stigmas reniform. Capsule inferior, 2-celled, many-seeded

Order 5. PENTANDRIA  Stamens 5.

2068 *Antidesma* Male Cal 5-leaved Cor 0 Anthers bifid. Female Stigmas 5 Berry cylindrical, 1-seeded
2069 *Iresine* Male. Cal. 2-leaved. Petals 5 Scales 5-7 Female Stigmas 2, sessile. Caps. with downy seeds
2070. *Spinacia* Male. Cal. 5-parted. Cor 0 Female Styles 4 Seed 1, within the indurated calyx
2071 *Fluggea.* Male Cal. 5-leaved. Cor. 0 Rudiment of an ovary Female. Style 2-parted. Stigmas recurved, bifid. Berry 4-seeded Seeds with an arillus.
2072 *Acnida* Male. Cal. 5-parted. Cor 0. Female Cal 3-parted Styles 0 Stigmas 3, sessile. Caps 1-seeded.

2074 *Cannabis.* Male Cal 5-parted Female Cal 5-leaved, entire, opening at the side Styles 2. Nut 2-valved within the closed calyx
2074 *Humulus* Barren fl Perianth single, of 5 leaves Anthers with 2 pores at the extremity Fertile fl Scales of the catkin large, persistent, concave, entire, single-flowered. Perianth O Styles 2. Seed 1
2075 *Modecca* Cal 5-fid Petals 5, inserted in the calyx Scales 5-10, rarely O Male. Stamens 5. Anthers erect. Female Caps stalked, 1-celled, 3 valved, many-seeded.

Order 6. HEXANDRIA.  Stamens 6.

2076 *Xerotes* Cor 6-parted, somewhat colored Male. Stamens 6. Anthers peltate. Female Stamens abortive Ovary 3-celled, with 1-seeded cells Caps cartilaginous, 3-celled, 3-valved Seeds peltate
2077 *Elais* Cal 6-leaved Cor 6-fid Style 1 Stigmas 3 Drupe 1-seeded, fibrous Nut 3-valved
2078 *Chamædorea* Cal 3-parted Cor 3-parted Stamens 6 Rudiment of a style. Female Scales 3 Styles 3 Drupe succulent, 1-seeded
2079 *Borassus* Cal 3-leaved Cor hypocrateriform, with a 3-parted limb Female Cal 8-9-leaved, imbricated Cor O Style O Drupe with 3 stones
2080 *Maurstia* Cal cyathiform, somewhat 3 toothed Petals 3 Drupe 1-seeded, tessellated
2081 *Smilax* Cal 5-leaved Cor O Styles 3 Berry 3-celled Seeds 2
2082 *Tamus* Cal. 6-parted Cor O Styles 3-fid Berry 3-celled, inferior Seeds 2
2083 *Testudinaria* Perianth 6-parted, spreading: segments linear, nearly equal. Male Stamens 6, inserted in the base of the segments Female Styles 3, united Capsule membranous Seeds winged
2084 *Rajania.* Cal 6-parted Cor. O Styles 3 Samaræ 1-seeded
2085 *Dioscorea* Cal 6-parted Cor O Styles 3 Capsule 3-celled, compressed Seeds 2, membranous Leaves generally alternate
2086 *Maba* Cal 3-fid Cor tubular, trifid Drupe 2-celled Cells 2-seeded

Order 7 OCTANDRIA  Stamens 8.

2087 *Populus* Barren fl Scales of the catkin lacerated Anthers 8-30, arising from a turbinate, oblique, entire, single perianth Fertile fl Scales of the catkin lacerated. Perianth, turbinate, entire Stigmas 4 Caps superior, 2-celled, 2-valved, many-seeded Seeds comose

Order 8 ENNEANDRIA  Stamens 9.

2088 *Mercurialis* Barren fl Perianth single, tripartite Stam 9-12 Anthers globose, 2-lobed Fertile fl Perianth single, tripartite Styles 2 Caps 2-celled Cells 1-seeded
2089 *Hydrocharis* Barren fl Cal tripartite Petals 3, "the three interior filaments beaked" *Sm* Fertile fl Cal tripartite Petals 3 Styles 6, each with 2 stigmas Caps inferior, coriaceous, roundish, six-celled, many-seeded
2090 *Triplaris* Cal 3 parted Petals 3 Stamens 9 Styles 3 Capsule 1-seeded, 3-valved

Order 9 DECANDRIA.  Stamens 10.

2091 *Coriaria* Cal 5-parted Cor O Scales 5 Anthers 2-parted Styles 5 Caps 5, 1-seeded, covered by the enlarged scales
2092 *Kiggelaria* Cal 5-parted Petals 5, glands 5, 3-lobed Anthers perforated Styles 5 Capsule one-celled, 5-valved, many-seeded
2093 *Schinus* Cal 5-fid Petals 5 Berry 3-coccous
2094 *Gymnocladus* Cal 5-toothed. Petals 5 Style 1. Legumen 1-celled, pulpy inside
2095 *Carica* Male Cal hardly any Cor 5-fid, funnel-shaped Filam in the tube of the cor Female Cal 5-toothed Petals 5 Stigmas 5 Berry furrowed, 1-celled, many-seeded

Order 10 DODECANDRIA.  Stamens 12.

2096 *Stratiotes* Male Spatha 2-leaved Cal 3-parted Petals 3 Stamens 11-13, perfect, 20 abortive Ovary inferior, 6-angular Styles 6, 2-parted Berry 6-celled, many-seeded
2097 *Hyænanche* Cal 5-7-leaved Cor O Stamens 10-20 Style 1 Stigmas 3 Caps 3-celled, 3-coccous Cells 2-seeded
2098 *Euclea* Cal 5 toothed Cor 5-parted Stamens 15 Ovary superior Styles 2 Caps berried, 3-horned, 3-celled Seeds solitary, with an arillus
2099 *Datisca* Male Cal 5-leaved Cor O Anthers sessile Female Cal 2-toothed. Styles 3 Capsule 3-angular, 3-horned, 1-celled, pervious, inferior
2100 *Menuspermum* Male Cal. 2-leaved. Petals 4 or 6 on the outside, 8 inside Stamens 16. Female Stamens 8, sterile Ovaries 2-3 Berries 2, 1-seeded
2101 *Cocculus* Sepals and petals ternate, usually in two, rarely in three rows Male Stamens 6, distinct, opposite the petals Female Drupes berried, 1-6, generally oblique, reniform, somewhat compressed, 1-seeded Cotyledons distinct

Order 11 ICOSANDRIA.  Stamens numerous, inserted in the calyx

2102 *Flacourtia* Cal 5-parted Cor O Stamens 50-100 Stigma stellate, sessile Berry many-celled, with 2-seeded cells
2103 *Peumus* Male Cal campanulate, 5-fid Petals 5, inserted in the calyx, reflexed Stamens about 46, glandular. Female Scales 5, subsagittate Ovaries 2-9 Style O Drupes oval, acuminate
2104 *Gelonium* Cal 5-leaved Cor O Stamens 12 Stigmas 3, lacerated. Caps 3-celled, 3-valved, 3-seeded
2105 *Rottlera* Male Cal. 2-parted Cor O Stamens 30-40 Female Cal 4-toothed Styles 3. Caps 3-celled, tricoccous, 3-seeded

Order 12. POLYANDRIA.  Stamens numerous, inserted under the ovarium

2106. *Cliffortia.* Cal 3-leaved. Cor. O Stamens about 30. Styles 3 Caps 3-celled. Seed 1.
2107 *Cycas* Male Catkin imbricated Cal. a spatulate scale. Cor O Anthers globose, sessile, on a scale Female. Spadix compressed, 2-sided Cal O Cor. O Style 1 Drupe 1-seeded
2108. *Zamia.* Catkin like a cone Male Calyx an obovate scale Cor. O Anthers globose, opening by a slit, sessile on the scale. Female. Cal peltate scales. Ovaries 2. Style O. Berries 2, 1-seeded.

Order 13. MONADELPHIA.  Stamens united into one body.

2109 *Latania.* Spadix many-leaved. Calyx 3-leaved. Petals 3. Stamens 15-16. Drupe coated, with three stones
2110. *Leptocarpus* Cal 6-leaved, glumaceous Cor O. Stamens 3 Ovary superior Style 1 Stigmas 2 or 3 Utricle or nut crustaceous, crowned by the base of the style
2111 *Ruscus* Cal 6-leaved. Cor O Male. Rudiment of ovary ovate, perforated at end. Female Style 1 Berry 3-celled Seeds 2.
2112. *Araucaria* Male Catkin imbricated Cal a woody scale. Anthers 10-12, united in a scale Female Catkin cone-shaped. Cal. a lanceolate 2-flowered scale. Style O Stigma 2-valved Nut coriaceous, cuneiform, winged at end.
2113 *Juniperus* Barren fl Scales of the catkin subpeltate Perianth O Stam. 4-8, 1-celled. Fertile fl Scales of the catkin few, united at length, fleshy, and surrounding the 3-seeded berry
2114 *Taxus* Barren fl Perianth single at the base Stam numerous Anthers peltate, 6-8-celled Cells opening beneath. Fertile fl Perianth. single, urceolate, scaly Style O Drupe fleshy, perforated at the extremity
2115 *Ephedra* Male A catkin Cal 2-fid Stamens 7 Anthers 4 inferior, 2 superior. Female. Cal 2-parted, quintuple Ovaries 2 Seeds 2, covered by the berried calyx
2116 *Cissampelos* Male Cal 4-leaved Cor O Disk rotate. Stamens 5 Filaments connate Female Cal 1-leaved, ligulate, roundish Styles 3 Berry 1-seeded
2117 *Excæcaria* Male Catkin cylindrical Cal a scale Filament 3-parted Female Calyx 3 scales Caps 3-coccous
2118 *Adelia* Male Cal 3-parted Cor O Stamens OO Female Cal 5-parted Styles 3, torn Capsule 3-coccous

History, Use, Propagation, Culture,

2041 *Pandanus* The Malay name of the genus is *Pandang*, which is said to signify, being interpreted, something to be regarded, and to have been so named on account of the beauty of the tree, and its exquisite odor P odoratissimus is a large spreading branching bush, with stem-clasping imbricated leaves, bearing some resemblance to those of the pine-apple, from three to five feet long, and placed in three spiral rows round the extremities of the branches It grows in all soils and situations in the warmer parts of Asia, and is much employed there for hedges It grows readily from branches, whence it is rare to find the full-grown ripe fruit The tender white leaves of the flowers, chiefly those of the male, yield that most delightful fragrance, for which they are so generally esteemed, and for which the plant is cultivated in Japan Of all the perfumes, it is by far the richest and most powerful. The lower pulpy part of the drupe is sometimes eaten by the natives in times of scarcity and famine. The tender white base of the leaves is also eaten raw or boiled, at such melancholy times The taste of the pulpy part of the drupe is very disagreeable The roots are composed of tough fibres, which basket-makers use to tie their work with, they are so soft and spongy as to serve the natives for corks The leaves are composed of longitudinal, tough, useful fibres In the South Sea Islands, where the Pandanus is also a native, this or some other species or variety is used for making mats The leaves are beautifully white and glossy In the Sandwich islands these mats are handsomely worked in

§ 1 *Leaves smooth-serrated*

13690 Leaves lin obl serr. smooth rather unequally sloping at base, Catkins accompanying the leaves triandrous, Ovary stalked ovate compressed smooth, Stigma nearly sessile
13691 Leaves lanceolate tapering toward each end serrat smooth Footst decurr Catk accompanying the leaves triandrous, Ovary stalked oblong constricted smooth
13692 Leaves lanceolate tapering at each end serrated glaucous beneath, Catkins accompanying the leaves triandrous polygamous, Ovary stalked oblong lanceolate smooth, Stigmas sessile
13693 Leaves lanceolate pointed obtuse at the base smooth wavy and serrated, Footstalks decurrent, Catkins accompanying the leaves triandrous, Ovary stalked elliptic oblong, Style elongated
13694 Leaves elliptical roundish at the base serrated pointed glaucous white beneath, Catkins accompanying the leaves triandrous, Ovary stalked ovate smooth, Stigmas sessile
13695 Leaves ovate unequal at the base serrated smooth, Catkins accompanying the leaves triandrous, Ovary stalked ovate compressed smooth, Stigmas nearly sessile, Young branches furrowed
13696 Lvs lanc serrate quite smooth, Petioles somew glandular, Ovary narrowed stalked, Branches varnished
13697 Leaves lanceolate acuminate serrated smooth, Ovaries pedicellate subulate smooth
13698 Lvs lin pointed finely serr it smooth, Stam al out 6, Ovary stalked round ovate smooth, Stigmas sessile
13699 Leaves elliptic-lanceolate pointed finely serrated smooth glaucous beneath, Catkins following the leaves, Stamens about 6 deflexed, Ovary stalked ovate smooth, Style elongated
13700 Leaves ovato-lanc pointed serrated green on both sides smooth with a downy rib and footst Catkins accompanying the leaves vill Stam about 5 bearded at base, Ovary stalked ov l inc smooth, Stigm divid
13701 Leaves elliptic-lanceol ite or ovate pointed crenate glandular smooth, Footstalks glandular at the top, Catkins following the leaves, Stam 5 or more hairy, Ovary ovate smooth nearly sessile
13702 Leaves ellipt lanc acute cren smooth glaucous beneath, Catkins before leaves, Ovary stalked lanc downy
13703 Leaves elliptical lanceolate with wavy serratures smooth glaucous beneath, Stipules somewhat lunate glandular on the inside, Ovary stalked silky, Style longer than the stigma
13704 Leaves obovate bluntish serrated smooth glaucous beneath, Catkins dense with fringed scales, Ovary stalked awl-shaped nearly smooth, Style longer than the stigmas
13705 Leaves elliptical acute at each end smooth serrat green on both sides midrib footstalks as well as young foliage downy, Catkins before the leaves, Ovary ovato-lanceolate long stalked smooth
13706 Leaves elliptical acute serrated smooth obtuse at base glaucous beneath midrib footstalk as well as young foliage hairy, Ovary oblong downy
13707 Leaves elliptical acute tooth-serrated smoothish glaucous beneath, Ovary lanceolate silky
13708 Lvs ellipt acute serrat smoothish glaucous ben Stip small or none, Catk hairy, Caps sess very smooth
13709 Leaves oblong elliptical acute serrated smooth glaucous beneath, Footstalks elongated downy, Stipules ovate toothed permanent, Catkins before the leaves, Ovary lanceolate smooth
13710 Lvs. ovate acute serrated undulate crackling smooth heart-shaped at the base glaucous beneath, Stipules unequally heart-shaped longer than the broad footstalks, Catkins very woolly, Ovary lanc smooth
13711 Lvs ovate acute serrated smooth glaucous beneath, Footstalks very short smooth, Stipules ovate serrated permanent, Catkins accompanying the leaves, Ovary lanceolate nearly sessile

and Miscellaneous Particulars

a variety of patterns, and stained of different colors The branches being of a soft spongy juicy nature, cattle will eat them very well when cut into small pieces They call it Wharra tree at Otaheite. (*Hawksw Voy* ii 217)

2042 *Salix* From the Celtic *sal*, near and *lis*, water Our common name osier, seems to be a slight alteration of the Greek *οσιρα*, which means the same thing This is a numerous and difficult genus of trees and shrubs, with one or two exceptions limited in their range to the temperate regions of Europe and America. Many of the species are distinguished by such delicate shades, that only the most acute botanists can recognize them Soil, situation, and climate produce so considerable a change in their appearance, as to render it difficult to determine what are species and what varieties Those species which attain a timber size, are chiefly valued for the rapidity of their growth, they produce a great bulk of trunk and lop in a short time, and the bark of most of the species has recently been used in tanning; being, at an average of sorts, about half as valuable as that of the oak S alba is considered the most valuable timber tree of the genus It has a branching stem, and tapering flame-shaped head. It may be seen pollarded by way-sides in most parts of Europe, in which state it is very productive of poles, fence wood, crate ware, fuel, and bark for the tanner, which is considered nearly as good as that of the oak. A variety of this species, called by Pontey, the red

History, Use, Propagation, Culture,

twigged upland willow, and the S Russelliana, are considered the two next best species of the tree kind, and indeed, greatly resemble each other

The best willows for hoops and basket work are S viminalis, stipularis, rubra, Forbyana, triandra, mollissima, and vitellina. S triandra is the most common, and is grown both for basket work and hoops. S. Forbyana is the best for the finer sorts of basket work S stipularis is the species commonly cultivated in Holland for hoops and rods. S purpurea is one of the toughest of willows, and the extreme bitterness of the leaves and twigs renders it valuable for the tanner, for withs and basket work, not being liable to be eaten by vermin, and for hedges which cattle will not brouse on In bands for thatching, Linnæus says, it lasts above

13712 Lvs oval-obl. acute with distant wavy serratures smooth glauc ben Stipules ½ heart-shaped deeply toothed, Catkins villous before the leaves, Ovary stalked ovate pointed silky, Style elongated, Stigma cloven
13713 Leaves ovato-lanceolate smooth bluntly serrated glaucous beneath, Catkins before the leaves, Scales short rounded hairy, Ovary awl-shaped silky on a stalk thrice the length of the scale
13714 Lvs. lanc acute very long gradually tapering at base finely serrated quite smooth scarcely paler beneath, Stip ½ heart-shap Catkins before lvs erect smooth, Ovary stalk ov smooth, Style divid Stigm 2-lobed
13715 Leaves lanceolate serrated smooth glaucous beneath somewhat unequal at base, Stipules lunate toothed, Catkins lax, Ovary stalked ovate silky, Stigmas sessile divided
13716 Lvs. ovato lanc bluntly serr smooth ac. glauc ben gland at base, Stip ov with gland serrat Catk wool. Ovary lanceolate smooth its stalk longer than the scale, Style the length of the divided stigmas
13717 Lvs ovato-lanc serrat smooth paler ben heart-shaped at the base, Stip rounded finely toothed, Catk accomp lvs mostly triand Sca lanc woolly, Ovary stalked lanc. smooth, Style length of divided stigm.
13718 Lvs ellipt lanc rigid smooth sharply serrat two lowest serratures elongated, Footst hairy, Stip dilated round with glandul serrat Catk accomp lvs mostly triand Sc woolly, Ovary lanc smth on long stalk
13719 Lvs. ov taper-point smooth shining with glandul serrat mostly crowded at stip tooth Catk accomp lvs mostly triand. Scales hairy at base obt serr and smooth at end, Ovary stalked lanc awl-shaped smooth, Style divided, Stigma obtuse
13720 Leaves lanceolate pointed smooth green on both sides with gland serr Catkins accomp lvs. Nect. double rather large its lobes lanceolate smooth toothed at the summit, the terminal flowers triandrous
13721 Lvs lanc acum. uneq and bluntly serrated smooth somew glauc ben Branches dark purple with a bloom
13722 Leaves lanc acute with cartilaginous serrat smooth above glaucous and somew silky ben Stip small and deciduous smooth on their inside Ovary sessile ovato-lanceolate smooth, Stigmas nearly sessile 2-lobed
13723 Leaves ovato-lanc pointed serrated throughout very smooth, Footstalks glandular, Ovary ovate nearly sessile, Male flowers with an abortive ovary
13724 Leaves broadly lanc pointed smooth with glandular serrat glaucous beneath, Footstalks slightly hairy without glands, Catkins before the leaves, Ovary sessile ovate smooth, Style elongated
13725 Triandrous, Stamens reflexed, Leaves about four inches long and one broad smooth and green beneath
13726 Leaves lanceolate taper-pointed sharply serrated smooth glaucous beneath, Stipules ½ ovate taper-pointed revolute, Catkins naked accompanying the leaves, Ovary ovate sessile smooth, Branches pendulous
13727 Decumb Stam 1, Leaves obovato-lanc serrated smooth narrow at base, Stigm very short ov nearly sess
13728 Lvs downy serrulate acum glaucous beneath, when old becoming smoother, Catkins before lvs Style long
13729 Erect, Stamen 1, Leaves mostly opposite oblong lanc pointed slightly serrated smooth linear at base, Style nearly as long as divided stigmas
13730 Erect, Stam 1, Lvs obov lanc ac serrat smth round at base, Stip none, Stig very short ov notched obt.
13731 Branches downy, Leaves elliptical acute glaucous beneath the young ones downy
13732 Stam combined below, Leaves linear lanc elongated acute smooth with shallow serrat green on both sides
13733 Erect, Stamen 1, Leaves alternate with small stipules lanceolate acute with shallow serratures smooth rounded at base glaucous beneath, Style nearly as long as the linear divided stigmas
13734 Stamens combined below, Leaves elliptical slightly serrated quite smooth glaucous beneath
13735 Leaves elliptic-oblong toothed waved thin and crackling very smooth, Stipules heart-shaped about the length of the footstalk, Catkins very woolly, Ovary lanceolate smooth on a short stalk
13736 Leaves linear lanceolate acute very finely serrated smooth shining and green on both sides, Stipules none, Catkins accompanying leaves cylindrical villous, Scales ovate acute, Stam 3 to 5 bearded half way up
13737 Leaves very long linear-lanc. closely serrated tapering gradually and somewhat falcate upwards acute at the base smooth on both sides the young ones silky, Stipules crescent-shaped toothed deflexed
13738 Leaves elliptical nearly orbicular smooth somewhat serrated in the middle rather glauc beneath, Catk after the leaves, Capsules ovato-lanceolate stalked downy
13739 Leaves ovate serrated naked smooth and even above glaucous beneath, Branches rather downy, Capsules ovate silky, Style as long as the stigmas
13740 Leaves elliptical serrated smooth veiny polished on both sides, Young branches hairy, Ovary awl-shaped clothed with silky hairs, Style as long as the cloven stigmas
13741 Leaves obovate-elliptical smooth rather acute serrated in the middle shining above somewhat glaucous beneath, Ovary lanceolate silky, Young branches smooth
13742 Lvs ov serrat nak reticul with prominent veins above rather glauc ben Ovary ellipt silky, Style very short
13743 Somew erect straggling, Branches polished, Lvs obl lanc acute at each end serrul in midd very smooth
13744 Leaves obovate lanceolate acute smooth subserrated glaucous beneath, Stipules small, Ovaries ovate silky
13745 Leaves ovate serrated smooth even above glaucous and silky beneath, Ovary ovate silky, Style as long as the stigmas, Stems decumbent
13746 Leaves ovate finely toothed smooth minutely veined folded so as to form a keel, Ovary ovate downy
13747 Lvs ov ellipt ac serrat smooth tapering at base glauc ben lower serrat glandular, Caps ov. lanc. smth
13748 Leaves oblong acute serrulate whole colored beneath, when old quite smooth

and Miscellaneous Particulars

a century in Scania Few of the willow species can be considered ornamental, though the male plants of S. pentandra and amygdalina produce numerous showy catkins of a bright yellow color, and very odoriferous The leaves of S pentandra are also fragrant, exuding a copious yellow resin from their serrated edges The down of the seeds of this and other species, mixed with the third part of cotton, has been found a useful adulteration, especially for stuffing cushions and forming candle-wicks Goldfinches and other birds line their nests with this material

The weeping-willow is generally admired, it grows wild on the coast of Persia, and is common in China It is sometimes said to have been introduced by Pope, but the celebrated specimen of that tree which stood in

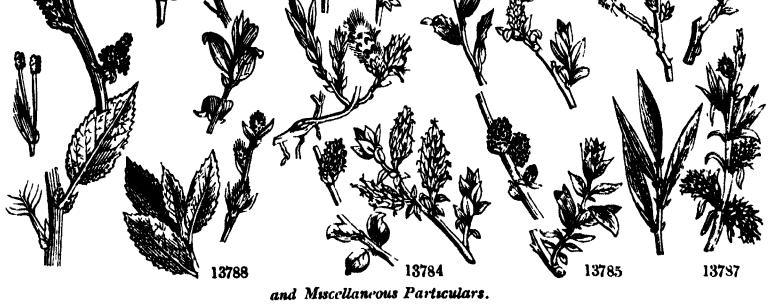
History, Use, Propagation, Culture,

the poet's garden at Twickenham, was a cutting from some rods employed in a package which came from Spain. Pope being present when the package was opened, observed that the pieces of stick appeared as if they had some vegetation, and added, perhaps they may produce something which we have not in England. Under this idea he planted it in his garden, and it produced the willow tree that has given birth to so many others, not as the parent tree of all the willows in the country, but as an admired and celebrated specimen S herbacea is not properly an herbaceous plant, but possesses the Linnean character of a tree, and is the smallest yet



13749 Lvs. lanc acut. serrul. smooth glauc. ben. Catkins appearing with lvs. Caps. ov. lanc. smooth, Styles twin
13750 Lvs obl lanc. acute crenul.-serr. glaucous beneath, Stipules obsolete, Scales short round with long hairs
13751 Lvs orbicul. somew. retuse serrated shining on each side, Fem catkins about 5-fl. Caps ov. lanc smooth
13752 Lvs. obl. and ovate acute toothletted glaucous beneath, Stipules large toothed, Catkins short, Styles long
13753 Leaves lanc. acute obscurely serrated smooth and shining on both sides reticulated with veins beneath, Ovary lanceolate hairy, Style elongated, Stigmas deeply divided

§ 2. *Leaves smooth entire.* [lanceolate smooth ovary

13754 Leaves obovato-lanc ent. emarg smooth shining above, Catk cylind many-fl Scales shorter than ovato-
13755 Leaves obovate entire smooth shining above, Fem. catk obl of few-fl Scales length of obl smooth ovary
13756 Lvs ov or ovato-lanc acute ent. smooth shin above, Catk. obl of few-fls Caps ellipt. smooth, Stigm sess.
13757 Leaves orbicular somewhat ellipt. obt entire coriaceous smooth with reticulated veins glaucous beneath, Stigmas nearly sessile, Capsule shaggy
13758 Lvs ovate entire bluntish smooth glaucous beneath, Ovary ovato-lanc smooth its stalk longer than scale
13759 Leaves obov lanc acute entire glandular at edge smooth glaucous ben : young ones silky, Stipules none
13760 Stem depressed, Leaves spatulate obovate obtuse entire smooth shining above gland at margin beneath, Stip none, Catk lax, Scales obl fringed, Ovary stalked ovate smooth, Style deeply divid Stigm 2 lobed
13761 Stem depressed, Leaves oval rather acute entire reticulated with veins heart-shaped at the base smooth above pale with a hairy rib and margin beneath, Stipules ½ heart-shaped
13762 Stem erect, Branches smooth, Lvs obov lanc. acute entire smooth, Stip none, Catk stalked very smooth, Scales oblong scarcely hairy, Ovary ovate obl smooth its stalk twice as long as scale, Stigm sess divided

§ 3. *Leaves villous* [ovate woolly

13763 Leaves nearly entire ellipt.-lanc even and nearly smooth above woolly ben Footst decurrent, Ovary sess.
13764 Leaves oblong lanceolate entire obtuse silky on each side, Caps ovate oblong villous sessile
13765 Leaves roundish ovate acute entire shaggy on both sides hoary beneath, Capsules sessile smooth, Style four times as long as the blunt divided stigmas
13766 Leaves lanceolate entire bluntish clothed on both sides with long silky hairs, Ovary sessile very woolly, Style about the length of the deeply separated cloven blunt stigmas
13767 Leaves nearly entire ovate acute reticulated and somew downy above veiny and densely woolly beneath, Ovary sessile very woolly, Style about the length of the deeply separated linear divided stigmas
13768 Stem erect, Lower leaves entire upper more or less serrated obovate lanc reticulated with veins glaucous and downy ben Stip half heart-shaped serr Ovary lanc stalked silky, Style as long as blunt stigmas
13769 Leaves ovate acute serrulate smooth above hairy beneath, Stipules minute, Catkins long
13770 Leaves elliptical acute waved and slightly serrated nearly smooth glaucous beneath, Footstalks dilated at the base, Catkins before the leaves, Ovary stalked lanceolate silky
13771 Leaves lanceolate sharpish nearly entire downy revolute veiny and rugose beneath, Stipules lanc decid Scales of the catk oblong fringed, Ovary ovato-lanceolate silky stalked, Style short, Stigmas divided
13772 Leaves elliptical entire tapering at each end polished the veins beneath as well as the margin hairy, Ovary elliptical downy, Style elongated
13773 Leaves entire elliptical somewhat revolute with a recurved point rather downy above silky and shining beneath as well as the branches, Ovary stalked ovato-lanceolate silky, Style shorter than the stigmas
13774 Leaves elliptical entire recurved acute above downy beneath silky, Ovary ovate lanceolate villous
13775 Leaves brown above downy with short hairs hoary beneath acute nearly entire
13776 Leaves obtuse brown smooth and opaque above silky beneath [ovate downy, Stem depressed
13777 Lvs. ellipt.-lanc straight somew point nearly ent almost naked above glauc and silky ben Ovary stalked
13778 Leaves elliptic-obl acute straight flat with a few glandular teeth glaucous and silky beneath, Footstalks slender, Stem erect much branched, Stipules none
13779 Leaves elliptical acute convex rarely toothed glaucous rugged and silky beneath, Stem prost. Branches elongated straight, Ovary stalked ovate silky, Style shorter than the stigm.
13780 Leaves elliptical acute finely downy on both sides glaucous beneath slightly serrated towards the point, Stipules very small, Catkins rather before the leaves ovate hairy
13781 Leaves elliptical entire acute at each end reticulated with veins glaucous beneath most hairy at margin, Ovary somewhat stalked ovato-lanceolate villous, Style the length of the deeply divided stigm.
13782 Leaves elliptical heart-shaped pointed finely notched downy on both sides, Stipules half heart-shaped flat-toothed nearly smooth, Branches hairy
13783 Leaves elliptical acute slightly-toothed smooth, Young branches very smooth, Catkins ovate short erect, Ovary stalked ovate silky, Stigmas ovate obtuse nearly sessile
13784 Lvs ellipt nearly ent. with recurv points glaucous and silky ben Stem decumbent, Stipules ovate entire
13785 Lvs ellipt.-obl somew serrat with recurv points glauc and silky ben Stem ascend Stipules ovate serrated
13786 Leaves lanc pointed straight somewhat elliptical entire convex smooth above glaucous and silky beneath, Catkins oval erect, Ovary stalked lanceolate, Style the length of the stigma
13787 Leaves linear-lanceolate pointed straight entire silky beneath, Stem erect, Stipules upright flat, Catkins recurved, Ovary stalked lanceolate silky

and Miscellaneous Particulars.

known, being only from one to three inches in height S retusa is nearly as little as S. herbacea. S. vitellina with its brilliant yellow bark, planted in shrubberies, contrasts well with evergreens and the purple twigged dogwood

Almost all the willows are of the easiest propagation and culture Plantations for basket-work or hoops should be made on deep loamy soil on the banks of rivers, within reach of water, but by no means saturated with it. Few willows are either bog or marsh plants. The cultivated species require as much attention as

History, Use, Propagation, Culture,

young trees in a nursery, otherwise they will soon become stunted and of irregular growth Excellent directions for their culture may be found in Sang's Planter's Kalendar

2043. *Cecropa* From κεκροψ, to cry out, a sort of translation of the English word trumpet-wood This tree has the trunk and branches hollow every where, and sloped from space to space with membranaceous septas, and answering to so many annular marks in the surface The leaves are large, peltate, lobed like those of Carica Papaya, and placed at the ends of the branches The fruits rise four, five or more, from the very top of a common pedunde, and shoot into so many oblong cylindrical berries, composed of a row of little acini, something like our raspberry, which they resemble in flavor when ripe, and are agreeable to most European palates on that account The wood of this tree, when dry, is very apt to take fire by attrition The native Indians have taken the hint, and always kindle their fires in the woods by rubbing a piece of it against some

13788 Leaves linear-lanceolate with small glandular teeth entire at the base clothed with close-pressed hairs above downy and rugged with veins beneath, Ovary ovate smooth
13789 Leaves linear very narrow without stipules nearly entire ovate at the base hoary above silky beneath
13790 Leaves lanceolate pointed serr smooth above glauc and silky beneath, Stipules linear deflex. deciduous, Catk before the leaves, Scales hairy, Ovary stalked oblong silky, Stigm nearly sessile
13791 Leaves lanceolate-obovate with a recurved point serrated at the end clothed with depressed hairs above rugged veiny and downy beneath, Stipules lanceolate
13792 Leaves obovate lanceolate obtuse mucronate with a hooked point subserrate green above hoary beneath
13793 Leaves obovate with a recurved point with wavy serrat. at end green and downy above hoary and shaggy with rugged veins beneath, Stip ½ heart-shaped toothed, Caps lanceolate stalked, Stigm nearly sessile
13794 Lvs slightly serrat obov.-ellipt. downy flat rather glauc. ben Stipules rounded tooth Stigm. nearly sess.
13795 Lvs obov. lanc flat rather rigid minute. indent ac undern glauc and hairy, Stip small notch Catk ellipt.
13796 Lvs ellipt almost circular slightly tooth downy with rectang veins ben Style as long as notched stigmas
13797 Leaves entire elliptical acute even downy on both sides somewhat withered at the point, Stipules obsol. Ovary lanceolate silky on a long hairy stalk, Stigmas nearly sessile
13798 Leaves ovate pointed serrated waved downy beneath, Stipules somewhat crescent-shaped, Ovary ovate downy on a long hairy stalk, Stigmas undivided nearly sessile
13799 Leaves nearly entire lanceolate acute shaggy above densely silky beneath, Stigmas capillary deeply divided, Style as long as the ovary
13800 Leaves lanc oblong pointed waved slightly downy beneath, Stipules kidney-shaped, Ovary ovate silky, Style the length of the linear stigmas
13801 Leaves oblong lanceolate acute distantly serrated smooth above flat and downy beneath, Stipules lunate somewhat toothed, Ovary stalked lanceolate silky, Style elongated, Stigm deeply cloven
13802 Leaves linear inclining to lanceolate very long pointed entire somewhat wavy silky beneath, Branches straight and slender, Ovary sessile, Style as long as the undivided linear stigmas
13803 Leaves lanceolate pointed obsoletely crenate whitish and silky beneath, Stipules crescent-shaped minute, Stigmas linear deeply divided about the length of the style
13804 Leaves lanc pointed obscurely crenate downy beneath, Stipules half heart-shaped very large, Nectary cylindrical, Stigmas linear undivided longer than the style
13805 Leaves linear lanceolate pointed revol obscurely toothed downy above snow-white and cottony beneath, Stip lanc about the length of the footstalk, Scales of the catk with hairs as long as the stamens
13806 Lvs obl lanc ac at each end nearly ent without stipul smooth above downy ben Ovary ovate lanc silky
13807 Leaves elliptic-lanceolate acute serrated permanently silky on both sides the lowest serratures glandular, Stamens hairy, Stigmas deeply cloven
13808 Lvs lanc. taper-point. serrat under-side at length almost naked, lowest serrat gland Stigm deeply cloven
13809 Leaves obovate serrated flat even silky on both sides, Stipules hairy, Branches minutely downy, Ovary stalked awl-shaped silky, Style as long as the undivided stigmas
13810 Leaves elliptic obl. acute finely notched slightly downy paler beneath, Stipulas half-ovate nearly smooth, Branches minutely downy, Ovary stalked smooth, Style as long as the cloven stigmas
13811 Leaves elliptical obovate acute notched slightly downy glaucous beneath, Stipules vaulted, Branches minutely downy, Ovary stalked silky, Style longer than the thick undivided stigmas
13812 Lvs obl acute entire silky on each side hoary ben Ovaries long-pointed lax, Scales very blunt smooth
13813 Lvs lanc acum toothl at end smooth above rugose and soft beneath, Caps downy lanc Stigmas sessile

13814 Leaves 9-lobed lobes oblong bluntish hispid and rough above white and downy beneath

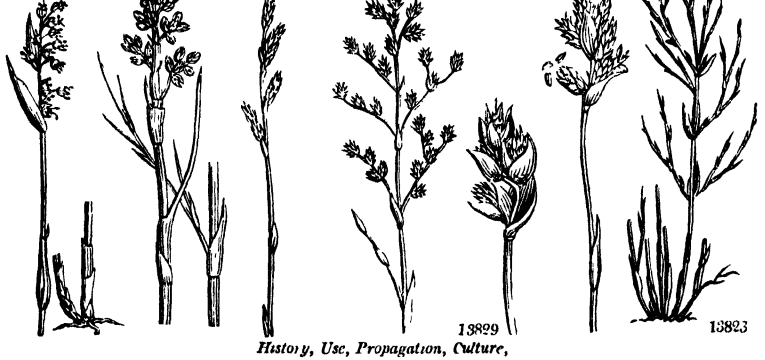
13815 Leaves oblong lanceolate obtuse sessile coriaceous revolute at edge dotted beneath
13816 Leaves ovate-lanceolate acute subsessile somewhat membranous
13817 Leaves ovate-lanceolate narrowed at each end stalked membranous serrulated
13818 Leaves 2¾ inches long 1 broad serrated
13819 Leaves acute serrulate very smooth shining opposite and alternate
13820 Leaves alternate tapered into a short stalk retuse emarginate mucronulate very smooth glaucous

TRIANDRIA.

13821 Erect, Branches downy, Leaves linear revolute at edge roughish above
13822 Procumbent, Leaves linear oblong

and Miscellaneous Particulars

harder wood The bark is strong and fibrous, and is frequently used for all sorts of cordage The trunk is very light, and for that reason much used for bark-logs and fishing-floats The smaller branches, when cleaned of the septums, serve for wind instruments Both trunk and branches yield a great quantity of fixed salt, which is much used among the French, to despumate and granulate their sugars The fruit is much fed upon by pigeons and other birds, and thus the tree is much spread and propagated. (*Browne*) It may be increased like Brosimum



2044 *Borya.* Named in honor of M Bory de St Vincent, a distinguished French traveller and naturalist, known out of the scientific world by the violence of his *liberal* opinions. Small bushes of North America, of little beauty Sir James Smith has altered the name to Bigelovia.

2045 *Empetrum.* So called from the places of its natural growth, ἐν, in, and πέτρος, a stone. E. nigrum is

History, Use, Propagation, Culture,

very common in the northern parts of Europe, in elevated situations, on dry, barren, moorish, or boggy soils It is more patient of cold than even the common heath The Highlanders' children eat the berries, but they are no very desirable fruit, and taken in large quantities, are said to bring on a slight head-ache The Russian peasants, however, eat them, and the Kamtschadales gather great quantities of them to boil with their fish, or to make a sort of pudding with the bulbs of their lilies They are esteemed antiscorbutic and diuretic Grouse and heathcocks feed upon them, and they give the excrement a tinge of purple. Boiled in alum-water they afford a dark purple dye, and boiled with fat, they are said to be used in dying otter and sable skins black Cattle do not seem to browse on this shrub The French word *Camarine*, is an alteration of *Camarinhas*, the Portuguese name of E. album

2046 *Willdenovia* A rush-like plant, with long flexible slender shoots, named in honor of Charles Louis Willdenow, a celebrated Prussian botanist, whose edition of Linnæus's Species Plantarum is not only the best which has been published in modern days, but excellent in itself

2047 *Restio* From *restis*, cord, the supple shoots of many species are used as withs at the Cape of Good Hope The houses of the Cape of Good Hope are commonly thatched with this plant both in town and country, and sometimes whole huts are built with it A roof thatched with it will last twenty or thirty years, and would last much longer, if the south-east wind did not blow much dirt into it, which causes it to rot.

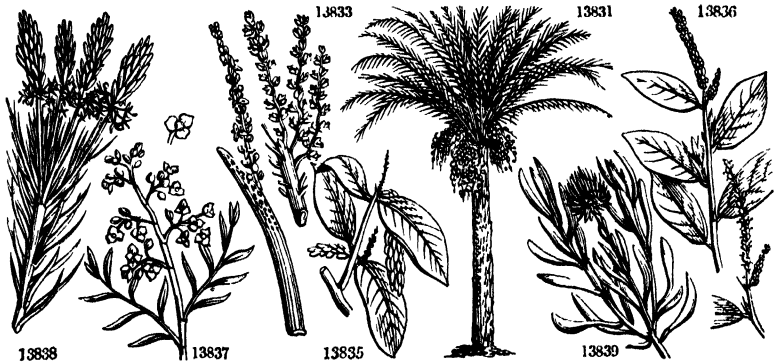
2048 *Elegia* From ἔλεγος, lamentation, in allusion to the sad or mourning color of the whole plant A hard rushy plant, with the habit of a Restio

2049 *Phœnix* The Greek name of the date, and probably so called from Phœnicia, whence the best dates were brought Dactylifera is the Greek version of Palma, both signifying the hand, to the fingers of which the ancients likened the bunches of dates P dactylifera is a lofty palm, with a rugged trunk, on account of the persisting vestiges of the decayed leaves. These leaves, when the tree is grown to a size for bearing fruit, are six or eight feet long, with pinnæ three feet long, and a little more than an inch broad The flowers of both sexes come out in very long bunches from the trunk between the leaves, and are covered with a spatha, which opens and withers, those of the male have six short stamina, with narrow four-cornered anthers filled with farina The female flowers have no stamina, but have a roundish germ, which afterwards becomes an oval berry, with a thick pulp enclosing a hard oblong stone, with a deep furrow running longitudinally The fruit of this tree makes a great part of the diet of the inhabitants of Arabia and part of Persia. In Upper Egypt many families subsist almost entirely upon it They make a conserve of it with sugar, and even grind the hard stones in their hand-mills for their camels In Barbary they turn handsome beads for paternosters of these stones The date is said to strengthen the stomach and intestines, to stop looseness, and promote expectoration, for which purpose it is given in pectoral decoctions It is also recommended in the piles, given in red wine From the leaves of the tree they make baskets or bags in Barbary In Egypt they make fly-flaps of them, and brushes to clean their sofas or clothes The hard boughs are used as fences to their gardens, and cages to carry their fowls to market The trunk is split for the same purposes, and is even used in small buildings It serves likewise for firing The threads of the web-like integument between the

13823 Culm and branches round smooth

13824 Culm simple leafless, Spikes racemose somewhat 1-sided roundish triquetrous cernuous with bracteæ
13825 Culm dichotomous leafy, Branches compressed, Spikes panicled pendulous
13826 Culm dichotomous leafy decumbent, Branches round, Spikes solitary and alternate
13827 Culm dichotomous leafy, Branches compressed, Spikes sessile alternate erect
13828 Culm simple leafless, Spikes alternate erect, Scales acuminate

13829 Culm simple nearly naked, Spathes very large ovate nearly acute, Spikes clustered thyrsoid
13830 Culm channelled, Spathes large ovate obtuse, Spikes racemose



13831 Fronds pinnated unarmed, Leaflets folded together linear-lanceolate straight
13832 Fronds pinnated unarmed, Leaflets folded together linear-lanceolate loosely spreading
13833 Fronds pinnated unarmed, Leaflets linear-subulate folded together, Flowers hexandrous
13834 Pinnæ linear-ensiform folded together lower spiny

13835 Flowers triandrous
13836 Flowers diandrous

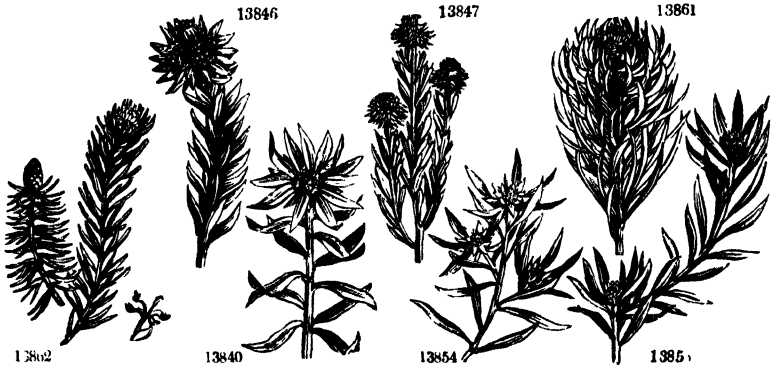
13837 The only species

TETRANDRIA.

13838 Leaves filiform channelled
13839 Leaves flat spatulate linear

and Miscellaneous Particulars

boughs make ropes and the rigging of smaller vessels The juice of the date tree is procured by cutting off the head or crown of the more vigorous plant, and scooping the top of the trunk into the shape of a basin, where the sap in ascending lodges itself, at the rate of three or four quarts a day, during the first week or fortnight, after which, the quantity daily diminishes, and at the end of six weeks or two months the tree becomes dry, and serves for timber or firewood This liquor, which has a more luscious sweetness than honey, is of the consistence of a thin syrup, but quickly becomes tart and ropy, acquiring an intoxicating quality, and giving upon distillation an agreeable spirit or araky, which is the general name in the East for all hot liquors extracted by the alembick



P farinifera produces black drupes of the size of a large kidney bean, these the natives of Coromandel eat as gathered from the bush without any preparation The leaflets are wrought into mats, the common petioles are split into three or four, and used for making ordinary baskets of various kinds, but they are not so proper for this purpose as the bamboo The small trunk, when divested of its leaves, and the strong brown fibrous web that surrounds the trunk at their insertions, is generally fifteen or eighteen inches long and six in diameter at the thickest part, its exterior or woody part consists of white fibres matted together, which envelope a large quantity of farinaceous substance, used as food by the natives in times of scarcity, but to separate this from the fibres, the trunk is split into six or eight pieces, then dried, beaten in wooden mortars, and afterwards sifted the rest of the preparation consists in boiling the meal into a thick gruel, or, as it is called in India, congee It seems to be much less nutritive than sago, and is less palatable.

2050 *Stilago* Perhaps so called from the length of the style; but the name is unexplained by its author. S. diandra produces an eatable fruit used by the natives, but not esteemed by Europeans. The species thrive in sandy loam, and cuttings root in sand under a hand-glass

2051 *Osyris.* The Greek name of a tree with long supple branches, which were used for brushes and similar purposes The modern shrub has also slender flexible branches, of which packing materials are formed throughout the south of Europe

2052. *Aulax.* From αυλαξ, a furrow, in allusion, we presume, to the furrows on the under-side of the leaves of the original species Neat shrubs with narrow leaves, nearly allied to Protea. This, Sweet observes, is "a pretty genus belonging to the Proteaceæ, which thrives best in a very sandy loam, with a great many potsherds broken small at the bottom of the pot, to let the water drain off freely, as they frequently get too much water, which makes the mould sodden, and stagnates their growth Ripened cuttings, taken off at a joint, and planted in a pot of sand, will strike root, if placed under a hand-glass in the propagating house, and the glass to be occasionally left off, an hour or two at a time, to give them air, and keep them from damping, which should be done in a morning before the sun has much power, or it will make them flag and injure them. Plants are readily raised from seeds, which should be sown in a mixture of two-thirds loam and one-third sand · as soon as they come up, they should be planted off in small pots, in the same kind of soil, as they are very apt to die, if left too long in the seed-pot" (*Bot Cult* 143)

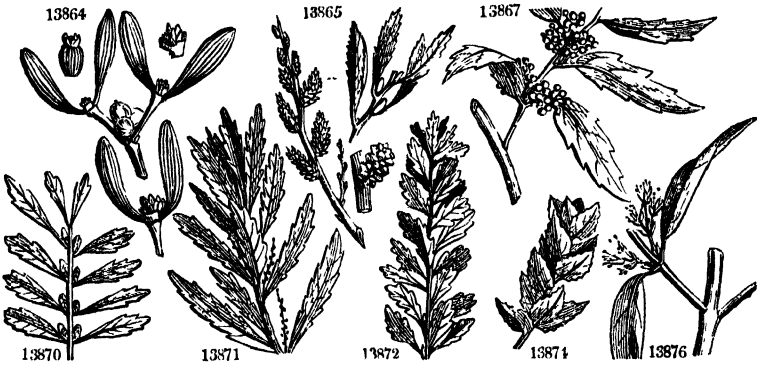
History, Use, Propagation, Culture,

2053 *Leucadendron* From λευκος, white, and δενδρον, a tree, in allusion to the appearance of the most common species, No 13,840 The species are evergreen shrubs, with handsome foliage; they grow in light soil well drained and not over watered, and are increased by ripened cuttings in sand under a hand-glass

2054 *Viscum.* From the Latin *viscus*, clammy, on account of the sticky nature of the berries. *Gui*, Fr, *Mistl*, Ger, and *Visco*, Ital This may be considered the only true parasitical plant indigenous to Britain, as at no period of its existence does it derive any nourishment from the soil like Orobanche, or from decayed bark or wood like certain Fungi, and other epiphytes The root of the misletoe insinuates its fibres into the woody substance of the tree, the shoots are dichotomous, round, smooth, and even; and of a pale green, like the leaves, which are tongue-shaped and entire The whole forms a pendant bush of from two to five feet in diameter, evergreen, and in winter covered with small white very glutinous berries. The British species of misletoe is commonly found on fruit trees, but it will grow on various others, as the thorn, oak, maple, poplar, lime, ash, &c, and in the neighbourhood of Magdebourg it is abundant on Pinus sylvestris It is not difficult to propagate by inserting the berries in slits in the bark early in spring, and tying a shred of mat over the slit to protect them from the birds The Druids sent round their attendant youths with branches of the misletoe to announce the entrance of the new year, and something like the same custom is still continued in France. In England branches of it are hung up in most houses at Christmas, along with other evergreens The berries are devoured by several birds of the thrush kind, and especially by the Misletoe Thrush. Birdlime is made from the berries, and also from the bark, boiled in water, beaten in a mortar and washed It is, however, more commonly manufactured from the bark of the holly



2055. *Myrica* The Greek (μυρικη) synonym of the Tamarix. It is said to have been derived from μυρω, to flow, because the plants are always found on the banks of rivers, and in inundated spots M Gale has leaves of a bitter taste, but fragrant like those of the myrtle Their essential oil rises in distillation The northern nations formerly used this plant instead of hops, and it is still in use for that purpose in some of the western isles, and a few places in the Highlands of Scotland Unless it be boiled a long time it is reported to occasion head-ache The catkins or cones boiled in water throw up a scum resembling bees' wax, which gathered in sufficient quantities would make candles It is used to tan calf-skins Gathered in the autumn it dyes wool

13840 Arborescent, Leaves lanceolate silky, Branches villous, Bractes short downy, Cal. silky
13841 Shrubby, Leaves linear lanceolate oblique smoothish, Male cal smooth female feathery, Fruit villous
13842 Lvs lanc lin smooth rounded at base, Branches vill Scales of cone silky cuneate, Fruit comose mucronate
13843 Leaves oval lanceolate when old smooth, Scales of cone dilated-cuneate silky
13844 Leaves spatulate callous at end, and branches villous, Fruit comose pointless
13845 Leaves linear spatulate tapering at base and branches smooth, Male head sessile larger than leaves
13846 Leaves linear lanceolate smooth . the younger straight tapering at base, Female head shorter than leaves

13847 Leaves linear bluntish twisted smooth, Branchlets somewhat silky, Cal silky, Fruit comose pointless
13848 Leaves spatulate linear silky with a callous beard at end, Cal very shaggy, Fruit cuneate downy
13849 Lvs lin acute channelled imbricated erect smooth, Scales of cone acute recurved, Fruit obcord ciliated
13850 Lvs obl veiny callous at end recurved smoothish floral colored ½ scarious, Scales of cone downy outside
13851 Leaves spatulate obl callous at end smooth, Branches downy, Scales of cone retuse ciliated downy at base
13852 Lvs lanc obl callous at end smooth floral colored, Branches somewhat downy, Scales ovate obt smooth
13853 Lvs spatul lanc call at end subdecurrent concave and branches smooth, Scales of cone roundish smoothish
13854 Lvs lin lanc mucron finally smooth, Involv ov ac longer than head, Scales of cone round dilated smooth
13855 Lvs lin acute with transparent edges and branches quite smooth floral lin lanc long, Fr winged emargin
13856 Leaves linear lanceolate acute floral lanceolate colored concave, Shrub low with ascending branches
13857 Lvs obl lanceolate bluntish veinless and branches quite smooth floral ½-colored, Fruit winged emarginate
13858 Leaves linear lanceolate cuspidate somewhat silky floral lanceolate colored, Fruit very narrow winged
13859 Leaves lanc lin silky with down on each side with callous points at end, Branches shag Cal of male hairy in lines
13861 Upp lvs lanc spatul ac rugose, Cones ov Scales cohering at base distinct above with recurv beardl. edges
13862 Lvs. all filiform chann bluntish smooth spreading incurved, Scales cohering at base distinct above 2-lobed
13863 Lvs all filiform channelled acute imbric straightish ciliated, Scales cohering at base distinct above 2-lobed

13864 Leaves lanceolate obtuse, Stem dichotomous, Heads of flowers axillary

13865 Leaves lanceolate broader upwards serrated, Stem shrubby
13866 Leaves oblong narrowed at base subserrate at end, Scales of male catkins acute, Berries globose
13867 Leaves oblong narrowed at base coarsely serrated, Scales of male catkins acute, Berries globose
13868 Leaves oblong acute at each end entire or slightly serrated at end revolute at edge
13869 Leaves elliptical lanceolate subserrate, Male catkins compound, Drupe with a 4 celled nucleus
13870 Leaves elliptical toothed the lowest quite entire
13871 Leaves lanceolate unequally acuminate serrated, Catkins long lax
13872 Leaves oblong deeply sinuated smooth
13873 Leaves oblong oppositely sinuated hairy
13874 Leaves subcordate serrate sessile
13875 Leaves oblong lanc. cuneate tapered at base nearly entire smooth shining with the middle nerve downy
13876 Leaves lanceolate entire netted with veins, Catkins few-flowered lax

and Miscellaneous Particulars

yellow, and is used for that purpose both in Sweden and Wales The Swedes sometimes use a strong decoction of it to kill bugs and lice, and to cure the itch The Welsh lay branches of it upon and under their beds to keep off fleas and moths, and give it as a vermifuge in powder and infusion, applying it also externally to the abdomen In most of the Hebrides, as well as in the Highlands of Scotland, an infusion of the leaves is frequently given to children to destroy the worms In Isla and Jura the inhabitants garnish their dishes with it, and lay it between their linen and other garments to give them a fine scent, and to drive away moths When it grows within reach of a port, the sailors make besoms of it for sweeping their ships. In the isle of Ely they make faggots with it to heat their ovens. Linnæus was induced to suspect, from the smell of this shrub, that camphor might possibly be prepared from it. Horses and goats eat, sheep and cows refuse it

M cerifera may be used for most of the purposes of the former species Candles are made from the berries in North America, whence it is called there the tallow shrub or candleberry tree, some also name it the bayberry-bush It grows abundantly on a wet soil, and seems to thrive particularly well in the neighbourhood of the sea, nor does it seem ever to be found high up in the country. The berries intended for making candles are gathered late in autumn, and are thrown into a pot of boiling water, their fat melts out floats at the top of the water, and may be skimmed off The fat when congealed looks like tallow or wax, but has a dirty green color, it is therefore melted again and refined, by which means it acquires a fine and pretty transparent green color. It is dearer than common tallow, but cheaper than wax. They usually mix some tallow with it. Candles of this kind do not easily bend or melt in summer as common candles do; they burn better and slower, nor do they cause any smoke, but rather yield an agreeable smell when they are extinguished At present not many candles of this kind are used, the animal tallow is readily come at, it being very troublesome to gather the berries They are chiefly used by poor people, who live near where the bushes grow, and have not cattle enough to supply them. A soap is made from the fat which has an agreeable scent, and is excellent for shaving, and it is used by surgeons for plasters. In Carolina they likewise make sealing-wax from these berries The root is accounted a specific in the tooth ache

All the species grow well in peat soil or sandy loam, in a moist situation They are increased by seeds or layers, but not readily by cuttings

History, Use, Propagation, Culture,

2056. *Nagœa* *Nagi* is the Japanese name of one of the species. That in the gardens is an uninteresting shrub with a loose elegant foliage, and a light grey bark Ripened cuttings strike freely in a bark pit

2057 *Shepherdia* A name given by Nuttall to the Hippophae canadensis of our gardens, in honor of Mr William Shepherd, the worthy curator of the Liverpool botanic garden A small inelegant tree, with dark green deciduous leaves, covered over with brownish silvery scales on the lower side

2058 *Hippophae* An ancient name given to some plant now unknown, which was applied medicinally to horses, from *ἵππος*, a horse, and *φαω*, to give light H rhamnoides is very prolific in berries, which are yellow when ripe, succulent, smooth, and gratefully acid to the taste They are much eaten by the Tartars, and the fishermen of the Gulph of Bothnia prepare a rob from them, which imparts a grateful flavor to fresh fish Every part of the plant will dye yellow. The species grow in common soil, and are readily increased by layers or cuttings of the roots

2059 *Broussonetia* Named by L'Heritier, in honor of his countryman P N V. Broussonet, a well known naturalist, who travelled in Barbary, and published an Ichthyologia in 1782 This is a vigorous growing shrub or low tree, with large lobed leaves, variously shaped; the foliage of the male and female plant differing so much from each other that they might easily be taken for distinct species The fruit is little larger than peas, and from the bark the Chinese make paper, and the Otaheitans cloth.

B. papyrifera, though a low tree, produces vigorous shoots, furnished with large leaves The fruit is little larger than peas, surrounded with long purple hairs, when ripe changing to a black purple color, and full of sweet juice. In China and Japan it is cultivated as we do osiers, for the sake of the young shoots, from the bark of which the inhabitants of the east countries make paper The bark being separated from the wood is steeped in water, and the inner bark separated from the outer, the former making the whitest and best paper. The bark is next slowly boiled, then washed, and afterwards put on a wooden table and beaten into a pulp This pulp being put in water, separates like grains of meal. An infusion of rice and the root of manihot is next added to it. From the liquor so prepared, the sheets of paper are poured out one by one, and when pressed, the operation is finished

The juice of this tree is sufficiently tenacious to be used in China as a glue, in gilding either leather or paper. The finest and whitest cloth worn by the principal people at Otaheite and in the Sandwich Islands is made of the bark of this tree. The cloth of the Bread-fruit tree is inferior in whiteness and softness, and worn chiefly by the common people

2060. *Schæfferia* So called after James Christian Schæffer, a German naturalist of celebrity, who is best known by his excellent work on the Fungi of Bavaria, published in 1762 An inelegant shrub with green flowers.

13877 Leaves ovate lanceolate oblique at base finely and simply serrated smooth

13878 Leaves oblong stellate-hairy above brownish white and scaly beneath

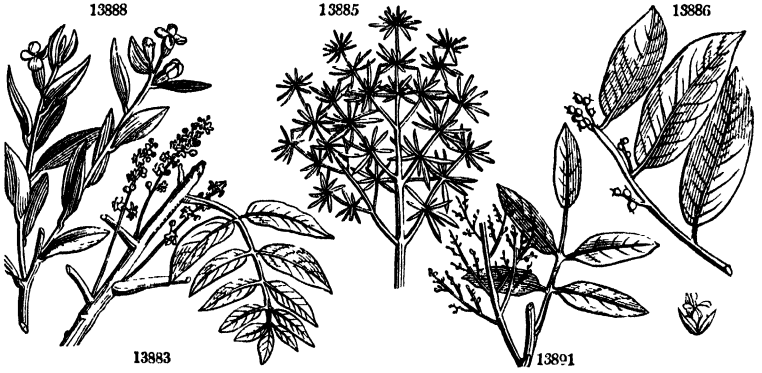
13879 Leaves linear-lanceolate smooth above white with scales beneath

13880 Leaves 3-5-lobed acuminate serrated scabrous
13881 Leaves cucullate entire

13882 Flowers tetrapetalous axillary

13883 Leaves opposite stalked pinnated with an odd one of 5 or 6 pairs
13884 Leaflets serrated villous beneath, Racemes often compound

13885 Leaves somewhat whorled linear smooth



13886 Unarmed, Leaves oblong acum entire smooth, Fruit 1-seeded cornute, Horns reflexed shorter than fruit
13887 Unarmed, Leaves obovate oblong acuminate unequally serrate very scabrous on each side

13888 Leaves alternate oblong oval, Fl solitary

PENTANDRIA

13889 Leaves pinnated with an odd one, Leaflets 5 ovate tapered at base rather acute and mucronate at end
13890 Leaves pinnate and ternate, Leaflets roundish narrowed at base netted with veins retuse mucronate

13891 Leaves pinnate with an odd one, Leaflets about 7 ovate-lanceolate rounded at base acute mucronate
13892 Leaves pinnate with an odd one, Leaflets lanceolate about 9, Petiole winged between the terminal pairs

and Miscellaneous Particulars

2061 *Brucea* Named in honor of James Bruce, a celebrated Scotch traveller in Abyssinia, who discovered the plant

2062 *Anthospermum.* From ανθος, a flower, and σπερμα, seed, its female flower is entirely naked, consisting of a single ovarium, whence its name A heath-looking evergreen, the leaves of which are fragrant when bruised, and the propagation and culture of the easiest description.

2063 *Trophis* From τρεφω, to nourish P americana produces berries about the size of large grapes, and of an agreeable pleasant flavor The leaves and twigs are used as fodder for cattle when grass is scarce Cuttings root in sand under a glass

2064 *Montsua* In honor of Laurence Montin, a Swede, who published a little tract upon Splachnum. The specific name seems to hint at the nature of his disposition A little worthless weed-like Cape plant

2065 *Pistacia* Said by Forskahl to have been altered by the Latins from its Arabic name *foustaq* P officinalis abounds in Sicily, where it is cultivated for its nuts The male flowers come out from the side of the branches in loose bunches, and are of an herbaceous color The female flowers come out in the same manner in clusters The male puts forth its flowers first, and some gardeners pluck them whilst yet shut, dry them, and afterwards sprinkle the pollen over the female tree but the method usually followed in Sicily, when the trees are far asunder, is to wait till the female buds are open, and then to gather bunches of male blossoms ready to blow, these are stuck into a pot of moist mould, and hung upon the female tree till they are quite dry and empty This operation is called *tuchsarare*, and never fails to produce fructification, sometimes the gardeners ingraft the male bud upon the female tree

P Terebinthus (from τρεω, to cut) furnishes the Cyprus turpentine It is procured by wounding the bark of the trunk in several places, during the month of July, leaving a space of about three inches between the wounds, from these the turpentine is received on stones, upon which it becomes so much condensed by the coldness of the night, as to admit of being scraped off with a knife, which is always done before sunrise in order to free it from all extraneous admixture, it is again liquified by the sun's heat, and passed through a strainer, it is then fit for use The quantity produced is very inconsiderable, four large trees, sixty years old, only yielding two pounds nine ounces and six drachms, but in the eastern part of Cyprus and Chio, the trees afford somewhat more, though still so little as to render it very costly, and on this account it is commonly adulterated, especially with other turpentines The best Chio turpentine is generally about the consistence of thick honey, very tenacious, clear, and almost transparent, white, inclining to yellow, and of a fragrant smell, moderately warm to the taste, but free from acrimony and bitterness

P. Lentiscus (*lentiscere*, to be sticky) produces the mastick, which is obtained most abundantly, by making transverse incisions in the bark of the tree, whence the mastick exudes in drops, which are suffered

History, Use, Propagation, Culture,

to run down to the ground, and after they are concreted they are collected for use These incisions are made at the beginning of August, when the weather is very dry, and are continued till the end of September

Turpentine and mastick are considered as astringent and diuretic, but though they retain a place in our Materia Medica, they are not much used by modern practitioners Mastick is used by the Turkish and Armenian women as a masticatory for cleaning the teeth and giving an agreeable smell to the breath It is also employed to fill the cavities of carious teeth (*Thom Lond Disp* 414)

2066 *Xanthoxylum* From ξανθος, yellow, and ξυλον, wood X Clava-Herculis is esteemed a good timber tree in Jamaica, and an infusion of the leaves is used to cure the tooth-ach there and in Carolina. All the species may be increased by ripened cuttings, or by cuttings of the roots

2067 *Picramnia* From πικρος, bitter A small tree with fruit the size of a gooseberry, and pinnate leaves, the whole plant abounding in the bitter principle Large cuttings strike freely in sand under a hand-glass

2068 *Antidesma* So called from the use of the bark in making ropes, from αντι, like, and δεσμος, a bond A alexiteria is a middle-sized evergreen tree, with leaves resembling those of the lemon, and fruit in racemes, red and acid like the barberry A decoction of the leaves is reputed to be an antidote against the bite of serpents, and the bark is used for making ropes All the species require a rich loamy soil, and ripened cuttings with their leaves on root in sand in a moist heat

2069 *Iresine* Suppliants were accustomed among the Greeks to present themselves before the altar with a branch of olive bound with wool, which offering they called ιρεσιωνη, whence this plant, which is very like such a branch, on account of its close clusters of woolly flowers, has been named Herbaceous plants not of great beauty

2070 *Spinacia* From *spina*, a prickle, on account of the processes of the seed A well known annual esculent of the easiest culture in any rich soil

2071 *Fluggea* Named by Willdenow, in honor of —— Flugge, a German Cryptogamic botanist. A shrub with round ash-colored spiny branches The spines are from one and a half to three inches long, very strong and numerous, whitish, and covered with leaves

2072. *Acnida* From α, privative, and κνιδη, a Greek name of the nettle, that is to say, a nettle-like plant, which does not sting

2073. *Cannabis* According to Bullet, this name is taken from the Celtic *can*, a reed, and *ab*, small But Golius says, the plant has been known by the Arabs from time immemorial under the name of *ganeb* The hemp is a manufactorial plant of equal antiquity with the flax. It grows to a great height on rich soils under a warm climate, in some parts of Italy it has been found eighteen feet high (*Cruds Agr*), the common height in Lombardy and the Bolognese territory is twelve feet, in this country it seldom exceeds six feet, and the fibre of British hemp is no finer than where it is three times the length The culture, management, and uses of hemp are nearly the same as those of flax, but the male and female flowers being on different plants, and the male plant decaying long before the female, the former requires to be pulled up as soon as the setting of the seed in the females shews that they have effected their purpose Hemp is sown on well prepared

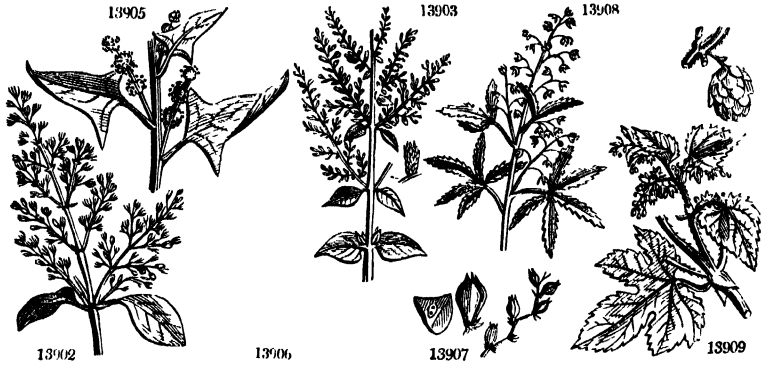
13893 Leaves abruptly pinnate, Leaflets lanceolate about 8, Petiole winged

13894 Unarmed, Leaves pinnate of 2 or 3 pair, Leaflets ovate emarginate villous, Racemes terminal
13895 Prickly, Leaves pinnate of 4 pair, Leaflets ovate repand-toothed unequal at base sessile, Panicles terminal
13896 Lvs pinn with an odd one of 4-5 pair, Leafl ov obsoletely serrul equal at base, Petiol rounded unarmed
13897 Lvs pinn with odd 1 of 3-5 pair, Leafl stalkl obl oval acum serrul obliq at base, Petiol and branch prickly
13898 Branches petioles and ribs prickly, Leaves pinnate with an odd one of 2-3 pairs, Leaflets oblong shining with remote glandular crenatures

13899 Racemes filiform pendulous, Flowers triandrous, Styles 2 recurved

13900 Lvs obl. narrowed at base acumin at end smooth shining on each side, Racemes axillary twin or solitary
13901 Lvs roundish cllipt rounded at each end retuse emarginate at point downy beneath, Racem term panicled

13902 Leaves dotted scabrous lower oblong acuminate, upper ovate-lanceolate, Panicle branched compact
13903 Leaves ovate-oblong acute, Panicle erect, Branches simple, Stem furrowed
13904 Leaves ovate smooth cuspidate, Panicle diffuse branched, Stem furrowed



13905 Leaves sagittate, Fruit sessile

13906 The only species Leaves alternate orbic ovate entire smooth, Spines 2 or 3 inches long

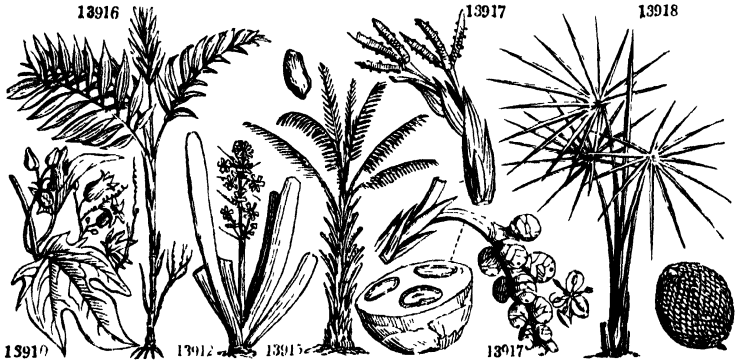
13907 Leaves lanceolate, Capsules smoothish acutangular

13908 The only species

13909 The only species

and Miscellaneous Particulars

loamy soil about the end of April the male plants are generally pulled about the beginning of July, and the females four or five weeks after them, when they have ripened their seeds The plants being tied in bundles, are watered and bleached, in the same manner as flax, or they are dried and stacked without having gone through this process, and the fibres separated when wanted by the flax-breaking machine of recent invention, or by steeping in hot water and soft soap The produce of hemp in fibre varies from three to six hundred weight per acre, in seed, from eleven to twelve bushels The fibre produces a cloth stronger than that from flax, and the best of all cordage and ropes An oil is extracted from the seeds of hemp, which is used in cookery in Russia, and in this country by painters The seeds themselves are reckoned a good food for poultry, and are supposed to occasion hens to lay a greater quantity of eggs Small birds in general are very fond of them, but they should be given to caged birds with caution, and mixed with other seeds A very singular effect is recorded, on very good authority, to have been sometimes produced by feeding bullfinches and goldfinches on hemp-seed alone, or in too great quantity, viz. that of changing the red and yellow on these birds to a total blackness (*Ency of Agr* 5327)



2074 *Humulus* From *humus*, fresh earth, the hop grows only in rich soils Our English word *hop*, seems to be the Anglo-Saxon *hoppan*, to climb *Lupulus* is a contraction of Lupus salictarius, the name by which it was, according to Pliny, formerly called, because it grew among the willows, to which, by twining round and choking up, it proved as destructive as the wolf to the flock

The hop has been cultivated in Europe an unknown length of time for its flowers, which are used for preserving beer Its culture was introduced from Flanders in the reign of Henry VIII, though indigenous both in Scotland and Ireland it is little cultivated in those countries, owing to the humidity of their autumnal season Like other plants of this sort, the hop bears its flowers on different individuals, the female plant, therefore, is alone cultivated There are several varieties grown in Kent and Surrey under the names of Flemish, Canterbury, Goldings, &c, the first is the most hardy, differing little from the wild or hedge-hop, the Goldings is a very improved and highly productive variety, but more subject to the blight than the other. The hop prefers a deep loamy soil on a dry bottom, a sheltered situation exposed to the south or south-west, but at the same time not so confined as to prevent a free circulation of air The soil requires to be well pulverized and manured previously to planting. In hop districts, the ground is generally trenched either with the plough or spade. The mode of planting is generally in rows, six feet apart, and the same distance in the row. Five, six, or seven plants are generally placed together in a circular form, and at a distance of five or six feet from each other The plants or cuttings are procured from the most healthy of the old stools, each should have two joints or buds, from the one which is placed in the ground springs the root, and from the other the stalk Some plant the cuttings at once where they are to remain, and by others they are nursed a year in a garden An interval crop of beans or cabbages is generally taken the first year. Sometimes no poles are placed at the plants till the second year, and then only short ones of five or six feet. The third year the hop generally comes into full bearing, and then from four to six poles from fourteen to sixteen feet in length are placed to each hill. The most durable timber for poles is that of the Spanish chesnut, which is much grown

History, Use, Propagation, Culture,

in Kent as coppice wood for that purpose The after-culture of the hop consists in stirring the soil, and keeping it free from weeds, in guiding the shoots to the poles, and sometimes tying them for that purpose with withered rushes, in eradicating any superfluous shoots which may arise from the root, and in raising a small heap of earth over the root to prevent any more shoots from arising

Hops are known to be ready for gathering, when the chaffy capsules acquire a brown color, and a firm consistence Each chaffy capsule or leafed calyx contains one seed Before these are picked, the poles with the attached stalks are pulled up, and placed horizontally on frames of wood, two or three poles at a time The hops are then picked off by women and children After being carefully separated from the leaves and stalks, they are dropped into a large cloth hung all round withinside the frame on tenter-hooks When the cloth is full, the hops are emptied into a large sack, which is carried home, and the hops laid on a kiln to be dried This is always done as soon as possible after they are picked, as they are apt to sustain considerable damage, both in color and flavor, if allowed to remain long in sacks in the green state in which they are pulled In very warm weather, and when they are pulled in a moist state, they will often heat in five or six hours for this reason the kilns are kept constantly at work, both night and day, from the commencement to the conclusion of the hop-picking season The operation of drying hops is not materially different from that of drying malt, and the kilns are of the same construction The hops are spread on a hair-cloth, from eight to twelve inches deep, according as the season is dry or wet, and the hops ripe or immature When the ends of the hopstalks become quite shrivelled and dry, they are taken off the kiln and laid on a boarded floor till they become quite cool, when they are put into bags

The bagging of hops is thus performed in the floor of the room where hops are laid to cool, there is a round hole or trap, equal in size to the mouth of a hop-bag After tying a handful of hops in each of the lower corners of a large bag, which serve afterwards for handles, the mouth of the bag is fixed securely to a strong hoop, which is made to rest on the edges of the hole or trap, and the bag itself being then dropped through the trap, the packer goes into it, when a person who attends for the purpose, puts in the hops in small quantities, in order to give the packer an opportunity of packing and trampling them as hard as possible When the bag is filled, and the hops trampled in so hard as that it will hold no more, it is drawn up, unloosed from the hoop, and the end sewed up, other two handles having been previously formed in the corners in the manner mentioned above The brightest and finest colored hops are put into pockets or fine bagging, and the brown into coarse or heavy bagging The former are chiefly used for brewing fine ales, and the latter by the porter brewers But when hops are intended to be kept two or three years, they are put into bags of strong cloth, and firmly pressed so as to exclude the air

The stripping and stacking of the poles succeeds to the operation of picking The shoots or bind being stripped off, such poles as are not decayed are set up together in a conical pile of three or four hundred, the centre of which is formed by three stout poles bound together a few feet from their tops, and their lower ends spread out

The produce of no crop is so liable to variation as that of the hop, in a good season an acre will produce 20 cwt.; in a bad season none, or only 2 or 3 cwt From 10 to 12 cwt. in a season reconsidered a tolerable average

13910 Leaves entire 3-7-lobed without glands cordate at base

and Miscellaneous Particulars

crop The quality of hops is estimated by the abundance or scarcity of an unctuous clammy powder which adheres to them, and by their bright yellow color

The expences of forming a hop plantation are very great, but once in bearing, it will continue so for ten or fifteen years before it requires to be renewed The hop culture in England, like that of the culture of the vine in France, is only calculated for cultivators of considerable capital, who can retain the produce from years of abundance to years of scarcity It is calculated on an average, that the hop crop fails almost entirely every fifth year, when the price will rise from two to thirty pounds per cwt To those who can cultivate and preserve the hop with a view to such a rise, few crops will be equally profitable

The hop is peculiarly liable to diseases, when young it is devoured by fleas of different kinds, at a more advanced stage it is attacked by the green fly, red spider, and otter moth, the larvæ of which prey even upon its roots The honey dew often materially injures the hop crop, and the mould, the fireblast, and other blights injure it at different times towards the latter periods of the growth of the plants

The use of hop in brewing is to prevent the beer from becoming sour, and this is the grand purpose for which it is cultivated But the young shoots both of the wild and improved hops are eaten early in the spring as asparagus, and were formerly brought to market for that purpose The stalk and leaves will dye wool yellow From the stalks a strong cloth is made in Sweden, the mode of preparing which is described by Linnæus in his Flora Suecica A decoction of the roots is said to be as good a sudorific as Sarsaparilla, and the smell of the flowers is soporific. During the illness of George the third, in 1787, a pillow filled with hops was used instead of opiates

2075 *Modecca*, is an Indian word by which two or three species of this genus appear in the Hortus Malabaricus, and has been adopted as a generic name by Lamarck A curious plant resembling a bryony, of easy culture and propagation

2076 *Xerotes* From ξηρος, dry, on account of the aridity of the herbage and of the situations in which it grows

2077. *Elais* The natives of Guinea express oil from the fruit of this, as the Greeks from their olives, ελαια, whence its name This palm bears a fruit about the size of a large plum The inhabitants of the West India Islands draw an oil from it, by the same process used in extracting oil from olives. From the sap an inebriating liquor is fermented, and the negroes weave the leaves into mats, on which they repose.

2078 *Chamædorea* Named, we presume, from χαμαι, dwarf, and δωρεα, a gift but we are ignorant of the sense in which the name has been applied

2079 *Borassus* This is one of the names which were applied to the spatha of the date, and was applied by Linnæus to the designation of this family of palms The fruit of this palm is of the size and shape of a child's head, a wine and a sugar are made from the sap of the trunk

2080. *Mauritia*. Named in honor of Prince Maurice of Nassau, the patron of Piso, for whom he obtained the necessary aid towards publishing his Natural History of Brazil A fine genus of palms

2081 *Smilax* From σμιλη, a grater, the stems are rough with stiff prickles S aspera has roots not unlike those of the Sarsaparilla. They have the same qualities, but in an inferior degree, and may be distinguished by

History, Use, Propagation, Culture,

being larger, more porous, and much less compressed S Sarsaparilla (*zarza*, furze, Spanish) has long slender roots covered with a wrinkled brown bark, white within, and having a small woody heart It is inodorous, and has a mucilaginous very slightly bitter taste Medicinally it is demulcent and diuretic It was brought to Europe about the year 1520, and introduced as a medicine of great efficacy in the cure of lues venerea, but it fell into disrepute and was little used, till it was again brought into esteem by Dr William Hunter and Sir William Fordyce, about the middle of the last century, not, however, as a remedy fitted to cure syphilis, but of much efficacy in rendering a mercurial course more certain, and after the use of mercury Experience, however, has not verified the encomiums bestowed on it, and the extensive observations of Mr Pearson have fixed the degree of benefit which is to be expected from this root in syphilitic complaints The contagious matter and the mineral specific may, he observes, jointly produce, in certain habits of body, a new series of symptoms, which, strictly speaking, are not venereal, which cannot be cured by mercury, and which are sometimes more to be dreaded than the simple and natural effects of the venereal virus. Some of the most formidable of these appearances may be removed by sarsaparilla, the venereal virus still remaining in the system, and when the force of the poison has been completely subdued by mercury, the same vegetable is also capable of freeing the patient from what may be called the sequelæ of a mercurial course Sarsaparilla is also recommended in scrophula, elephantiasis, or cutaneous affections resembling it, and in chronic rheumatism, but its efficacy is doubtful (*Thom Lond Disp* 505)

S. China has roots as long as a child's hand, twisted, full of knots, reddish on the outside, flesh-colored in the heart, and destitute of smell It is employed both as food and medicine in China, and to feed hogs in the West Indies None of the species are of much beauty or worth growing, but as objects of curiosity

2082 *Tamus* This name was employed by Columella and others, for a plant resembling a vine, and bearing fruit not unlike grapes, a description which does not apply badly to the modern plant T communis has very large tuberous black coated masses attached to its roots These are so acrid, that the pulp has been formerly used as a stimulating plaster The young shoots, however, are so mild as to be good eating when dressed like asparagus The Moors eat them boiled with oil and salt. The flowers of the female plant are succeeded by ovate smooth berries

2083 *Testudinaria* So called from the resemblance which the great rugged cracked root of this plant bears to the shell of a tortoise (*Testudo* The rootstock is a large fleshy mass, covered with a thick bark cracked deeply in every direction The Hottentots in time of scarcity make use of the fleshy inside of the root as a sort of yam

2084 *Rajania* Named in honor of our distinguished countryman John Ray, a distinguished naturalist,

13927 Stem prickly rounded, Leaves ovate oblong acute subpanduriform obsoletely cordate 5-nerved

13953 Leaves opposite cordate roundish ovate acute 7-nerved, Stem round smooth
13954 Leaves alternate cordate lanc narrow 3-nerved longer than petiole, Stem smooth
13955 Leaves opposite and whorled cordate acuminate 9-nerved downy beneath, Stem round

13956 Leaves opposite ovate acuminate 7-nerved, Stem round smooth

and Miscellaneous Particulars

born in 1628, died in 1705, and author of many works of the highest reputation His zoological arrangement is still regarded with much respect Twining plants resembling the Yam

2085 *Dioscorea* In memory of Pedacius Dioscorides, a Greek physician, born at Anazarba, in Cilicia. He is generally believed to have lived under Nero, but this is very uncertain Abulfarrage makes him to have flourished under Ptolemæus Physcon, but he is not generally credited D sativa, *Iguame*, Fr, and *Inhame*, Portug, has large thick tubers, a foot broad, and palmated like some Orchises The stalks are slender, and with the leaves bear some resemblance to black bryony The yam is largely cultivated for food in Africa and the East and West Indies, especially in the latter for the negroes The roots grow to a great size, are mealy, and esteemed to be easy of digestion, they are palatable, and not inferior to any roots now in use, either for delicacy of flavor or nutriment. They are eaten instead of bread, either roasted on the embers or boiled, the flower is also made into bread and puddings In Otaheite they make a dish, which they esteem very delicious, from the roots of the yam, with the kernel of the cocoa-nut scraped, and the pulp of the Musa or Banana The juice of yam-roots fresh is acrid, and excites an itching on the skin There are many varieties of these roots, some spreading out like the fingers (*Rumph* t 121), others twisted like a serpent (*Rumph.* t 122), others again very small, scarcely weighing more than a pound, with a whitish ash-colored bark, whereas the bark is commonly black The flesh of the yam is white or purplish, and viscid, but becomes farinaceous or mealy when dressed

D aculeata, by some considered only an improved variety of the sativa, is universally cultivated in the East and West Indies, in Africa, and in all the islands of the southern ocean within the torrid zone, and even as far as New Zealand The tubers are frequently three feet long, and weigh thirty pounds All the edible species and varieties are propagated in foreign countries like the common potatoe, but they arrive much sooner at maturity The buds of the roots are not apparent, but still a small piece of skin is left to each set, for from this piece of bark alone the shoots proceed. Holes are made in rows two feet apart, and at eighteen inches distant in the row, into those holes two or three sets are put, first covered with earth, and then with a little haulm or rubbish to retain moisture The only after-culture consists in hoeing up the weeds They are commonly planted in August, and are ripe about the November or December following. When dug up, the greatest care is taken not to wound them, as that occasions them to sprout much earlier than they otherwise would do They should be rubbed over with ashes, and piled regularly on beds or hurdles raised above the floor, that the air may come easily between them, or, if they be piled in heaps, some ashes should be strewed between the layers None of the species are worth cultivating as ornamental plants, but some of the edible sorts have been raised in hotbeds in the Paris garden, and being transplanted early into a warm situation, have produced tubers of a considerable size

History, Use, Propagation, Culture,

2085 *Maba* The name given to the plant by the natives of Tonga-Tabu, according to Forster (*Gen.* 61) This shrub or small tree produces edible berries very well tasted The wood is dark colored, remarkably hard and durable, and where its size will admit, is employed for such uses as require the most durable, compact, and heavy timber

2086 *Populus* In ancient times the public places of Rome were decorated with rows of this tree, whence it came to be called arbor *populi*, as being a tree peculiarly appropriated to the *people* But Bullet asserts, that the Poplar has obtained its name from the constant motion of the leaves, which are in a perpetual state of agitation like the *populace* All the species are rapid-growing soft-wooded timber trees, some of which attain a very great size P alba is one of the most valuable of the British species The leaves of the common gray poplar are of a blackish-green above, but having a thick white cotton underneath, they are about three inches long, on petioles a foot in length The leaves of the Abele are about double the size, and divided into three, four, or five lobes The leaves of the gray poplar are also larger more deeply lobed, and the under-side of the leaves and young shoots are covered with a hoary down The Abele is said to have been introduced from Flanders, and the hoary poplar to have been originated in this country The timber is of great value for all sorts of wooden vessels, especially butchers' trays It is of quick growth, soft, white, and stringy, and little subject to swell or shrink It makes beautiful floors and turners' ware Some of the finest Abeles in England are at Hartwell near Aylesbury

P tremula is commonly called the asp, from the German *espe*, which is the general name for all poplars, is a rapid-growing tree in almost any soil or situation but the numerous shoots of the roots spread so near the surface that they will not permit any thing else to grow there The wood is extremely light, white, smooth, soft, and durable in the air It may be used for the same purposes as that of the Abele The bark is the favorite food of beavers On the leaves and leafstalks may sometimes be seen red glandular substances about the size of a pea, which are the nests of Pipula juniperina P nigra has a naked lofty trunk covered with an ash-colored bark, and a regular handsome head It is a tree of quick growth, and on the banks of rivers and in moist situations it grows up to a great height in a short time The bark is light like cork, and is sometimes used by fishermen to float their nets The timber is light and soft, fit for the turner and pattenmaker, and excellent for flooring-boards These boards are much slower in taking fire than those of resinous trees, they smoke a long time before they burst into a flame of course the wood is bad for fuel Many species of insects are supported by this and the other poplars The red substance like berries upon the leafstalks of this species are occasioned by the Aphis Bursoma. The leaves and young shoots are gathered in Sweden and other parts of Europe during the month of October and dried, to be given as fodder to the sheep in winter The practice is as old as the time of the Romans, who, as well as the modern Italians, planted this tree for their vines to run on. In Kamchatka the inhabitants are sometimes reduced to the necessity of converting the inner bark into bread Scheffer made paper from the cotton down of the seeds The buds both of this and the white poplar smell very pleasant early in the spring, and being pressed between the fingers yield a balsamic resinous substance, which, extracted by spirits of wine, smells like storax. A drachm of this tincture in broth is administered in internal ulcers and excoriations.

The black Italian poplar, so much recommended by Pontey, and said by him to have been intro-

and Miscellaneous Particulars

duced from America, seems intermediate between P nigra and dilatata, indeed, all the three sorts are by some considered as but one species P dilatata differs from the common black poplar chiefly in its close conical manner of growth, which resembles the cypress The leaves are greater in breadth than length, whereas in the black poplar the longitudinal character is the greatest Though it generally attains a great height, the increase of the trunk is by no means so rapid as in most of the other poplars It cannot, therefore, be highly recommended as a timber tree In Italy it is considered peculiarly adapted for packing-boxes, nails do not split it, and if cases of this wood fall or are thrown carelessly on the ground, it gives way a little, and returns to its former position without splitting, which oak and other heavy woods will not do In Lombardy all the vessels in which the grapes are carried home in carts from the vineyards, are of poplar plank, about two inches thick, and in them the grapes are squeezed Such vessels last thirty or forty years, and by their lightness are manageable, however large and long A four-wheeled cart is in general covered with one of them, and it contains about fifteen hundred weight of grapes, each hundred being a hundred pounds of thirty ounces The conic form of the Lombardy poplar, as a deciduous tree, is peculiar Among evergreens we find the same character in the cypress, and both trees, in many situations, have a good effect The cypress often, among the ruins of ancient (and the buildings of modern) Rome, breaks the regularity of a wall or a pediment, and the poplar has the effect among deciduous trees of the round-headed kind One beauty the Italian poplar possesses which is almost peculiar to it, and that is the waving line it forms when agitated by the wind Most trees, in these circumstances, are partially agitated, one side is at rest while the other is in motion, but the Italian poplar waves in one single sweep from the top to the bottom, like an ostrich-feather on a lady's head All the branches coincide in the motion, and the least blast makes an impression upon it when other trees are at rest

P balsamifera is a moderate sized conical tree, a native both of Siberia and America. The buds of this tree, from autumn to the leafing season, are covered with abundance of a glutinous yellow balsam, which often collects into drops, and is pressed from the tree for medical use This balsam is brought to Europe from Canada in shells It is smooth, of an even texture, a yellowish color, and a fragrant scent In Siberia a medicated wine is prepared from the buds, which is diuretic, and esteemed by the inhabitants serviceable in the scurvy The grouse and other birds of that family feeding on these buds during winter, acquire a flavor which is much esteemed by epicures P candicans bears a general resemblance to the preceding species, and, like it, the buds are covered with a resinous tenacious balsam The other American species are rapid-growing bulky timber-trees, well calculated for immediate effect and utility, but all the species being short-lived when compared with oaks, elms, and other slower-growing hard-wooded trees, confer a temporary premature character on landscape, for nothing can be great and lasting but what advances by degrees Such poplars as do not grow freely from cuttings of the shoots, are most rapidly increased by cuttings of the roots, but the largest plants are produced from layers

2087 *Mercurialis* Mercury is said to have discovered the virtues of this plant. Böhmer, indeed, in his *Lexicon*, says, after Ambrosinus, that the name is a corruption of *mulsercularis*, as being useful to women, but the Greeks call it *ἰερμὴ τοῦ*, which is the same as Mercurialis in its mythological sense M perennis is not eaten by any quadruped, and is poisonous to men and sheep The plant on being dried turns blue, and steeped in water it

History, Use, Propagation, Culture,

affords a fine deep blue color, destructible, however, both by acids and alkalies It has been observed that the male and female plants are seldom found intermixed, each sort usually growing in large patches, whence it is probable that this plant, which increases much by the root, rarely produces perfect seeds. M. annua was formerly accounted medicinal, its seeds taste like those of hemp

2089 *Hydrocharis* From ὕδωρ, water, and χαρις, grace This little plant is one of the prettiest ornaments of still waters This plant increases by runners, which shoot out to a great length, and at the joints drop down long roots, which penetrate deep into the mud The joints are furnished with pendulous buds, supported on long footstalks. The buds consist of two stipulaceous scales folded together, within which are curiously enveloped the embryo leaves of the future plant.

2090 *Triplaris* All the parts of the fructification are in threes or *triple* T americana is a tree forty feet high, with a dense pyramidal head The leaves are oblong, entire, smooth, a span long The branches are often hollow, and are then filled with an innumerable quantity of little red ants, which are often showered down upon any incautious traveller who may stand under the shade of the tree, and whom they bite severely. (*Bredemeyer*)

2091 *Coriaria* A tanner's plant, from *corium*, a hide. Coriaria myrtifolia has handsome leaves, but very little beauty in the flowers It is considerably astringent, and is used not only in tanning leather, but in dying black colors It produces abundance of suckers

2092 *Kiggelaria* Named after Francis Kiggelar, an obscure botanist, who lived at the end of the seventeenth century An uninteresting plant Ripened cuttings strike in heat under a hand-glass

2093 *Schinus* This was the Greek name of the Pistacia Lentiscus It is now applied to an American genus which resembles Pistacia in sensible properties The word *molle*, applied to one species, does not allude to any softness in the plant which bears the name, but is a slight alteration of the Peruvian word *multi*. Fragrant shrubs with beautiful foliage, easily cultivated in a cold conservatory or out of doors in a warm sheltered place

2094 *Gymnocladus.* From γυμνος, naked, and κλαδος, a shoot, on account of the naked appearance of its strange rigid shoots during the winter This tree or shrub has pinnate leaves nearly a foot and a half long, both leaves and stalks are armed with thorns The stalks at first grow erect, but afterwards twine about the neighbouring trees and shrubs It is best propagated by cuttings of the roots.

13977 Stem suffruticose brachiate, Leaves elliptical acute at each end smooth glandular serrated
13978 Stem suffruticose, Leaves oblong downy with serratures on each side at the end

13979 The only species

13980 Racemes terminal and axillary brachiate

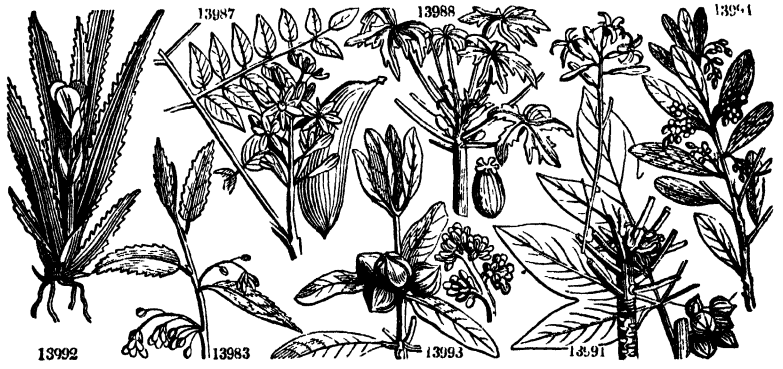
DECANDRIA.

13981 Leaves ovate-lanceolate 3-nerved stalked
13982 Procumbent diffuse, Leaves cordate-ovate acuminate entire 5-nerved stalked, Racemes nodding

13983 Leaves oblong unequally serrated

13984 Leaves pinnated, Leaflets serrated the odd one very long, Petioles equal
13985 Leaves simple toothed
13986 Leaves simple entire and trifid, Flowers generally octandrous

13987 Leaves bipinnate very large deciduous, Flowers equal dioecious



13988 Leaves palmate 7-lobed middle lobe sinuated, segments oblong acute, Male flowers corymbose
13989 Leaves palmate 5-lobed middle lobe sinuated, segments lanceolate, Male flowers from excrescences of trunk
13990 Leaves digitate, Leaflets 7 oblong acuminate entire, Trunk spiny
13991 Leaves 3 or 5-lobed middle lobe 3-lobed, Male flowers corymbose
β Lower leaves entire cauline 3-lobed, upper 5-lobed, Flowers monoecious subracemose erect

DODECANDRIA.

13992 Leaves linear lanceolate keeled prickly toothed

13993 Branches diffuse cinereous scarred, Leaves opposite 3 or 4-nate oblong retuse coriaceous

13994 Leaves oblong or obovate flat
13995 Leaves obovate wavy

and Miscellaneous Particulars

9095 *Carica* According to Linnæus, because a native of Caria, but as the plant has no relation to that country, it would be better to adopt, with Jussieu, the specific name Papaya for the genus C. Papaya rises with a thick soft herbaceous stem to the height of eighteen or twenty feet, naked till within two feet of the top, and having marks of the fallen leaves great part of its length The leaves have long footstalks, are very large, and divided into many lobes The whole plant abounds with a milky acrid juice, which is esteemed good for the ringworm The male flowers, which are in loose clusters on long peduncles, are of a pure white, and have an agreeable odor Sometimes these are succeeded by a small fruit about the size of a pear, which has occasioned some to suppose the male plant a distinct species The flowers of the female have short peduncles; they are large and bell-shaped, composed of six yellow petals When these drop off, the germ swells to a large fleshy fruit the size of a small melon When ripe it is eaten by the inhabitants of the Caribbee Islands, but its flavor is very indifferent The most common use of them is when they are about half grown, to soak them in salt water, to get out the milky juice, and pickle them as mangoes, for which they are considered a good substitute. The plant generally is said to have the property of intenerating animal fibre by suspension under its leaves or branches, but this quality wants confirmation In our stoves the plants grow freely in loamy soil, and are increased by large cuttings with their leaves on in a moist heat

2096 *Stratiotes* From στρατος, a camp, in English, water-soldier, both names alluding to the military appearance of the plant, with its long sword like leaves, and flowers which may be liked to plumes of white feathers An aquatic plant, remaining the greatest part of the year immersed in water, but rising to flower It increases with such rapidity as to become a troublesome weed in artificial pieces of water in which it is planted

2097 *Hyænanche* From *hyæna*, and αγχω, pain, because the fruit is used at the Cape of Good Hope to poison hyænas A small tree, six or seven feet high, also called Toxicodendron capense The flowers grow in axillary branched yellowish panicles, and are succeeded by smooth nuts, which, being pounded, are used to poison the carcases of lambs, by which the hyænas are infallibly destroyed

2098 *Euclea* From ευκλεια, glory or beauty, in allusion to the permanent beauty of the neat evergreen foliage of the plants Shrubs or small trees, natives of the Cape of Good Hope Of one species the berries are brought to the market of Cape Town for sale, and is the only kind of native fruit, except that of Cissus capensis, which is there eaten Ripened cuttings root in sand under a glass.

History, Use, Propagation, Culture,

2099 *Datisca* A word the meaning of which is unknown The plant is of no beauty, and of the easiest culture

2100 *Menispermum* From μην, the moon, and σπερμα, seed, on account of the crescent-like form of the fruit All the species are of the easiest propagation and culture

The M palmatum produces the famous Colombo root, which is so remarkable for the intenseness of its bitter taste, and valuable on this account in dyspepsia, diarrhœa, dysentery, and as a wash for putrid sores

2101 *Cocculus* This word is derived from *coccus*, the name of the well-known dyers' insect, and has been applied to this genus on account of the resemblance which has been found to exist between that insect and the scarlet berries of the plant A genus with the habit of Menispermum

Cocculus Plukenetii produces berries and bunches like grapes, but smaller, first white, then red, and finally blackish purple In the East Indies they are made up into a paste, and used to intoxicate fish, birds, and different sorts of vermin

2102 *Flacourtia* Named in honor of Etienne de Flacourt, a director of the French East India Company, and the commander of an expedition to Madagascar in 1648, of which he afterwards wrote an account, containing considerable details upon the botany of the country L'Heritier dedicated to him the first species of the genus, which was found by him in Madagascar, where it is called *Ramontchi* It is a thorny shrub or tree, with leaves and fruit resembling those of the plum The fruit is green when young, of a beautiful red when ripe, and finally of a dark violet color the skin is very thin, and the flesh transparent red, of the same consistence with our common plums in the middle are a dozen or fourteen small kernels, the size of those in the apple, and nearly of the same shape, they are bitterish like our apricot kernels, and covered with a tender shell The natives eat the fruit, it is sweet, but leaves a slight sharpness in the mouth An island on the coast of Madagascar is covered with these trees, and because they resemble the European plum-tree, the sailors have named the island *Isle aux Prunes*, or Plum-tree Island. All the species grow freely in a mixture of loam and peat, and cuttings root in sand, plunged and covered

2103. *Peumus* The Chilian name of this plant is *Peumo* It is the Ruizia of the Flora Peruviana, and forms an evergreen tree among the woods upon the sandy shores of Chili; it is valuable for its wood, which is very fragrant

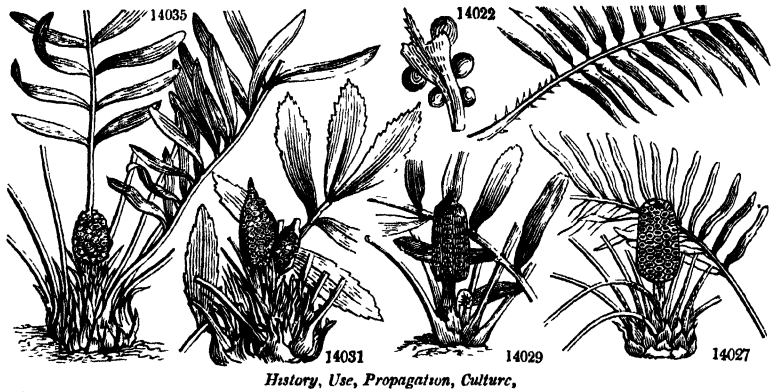
and Miscellaneous Particulars

2104 *Gelonium* So named by Roxburgh, but it is not known with what meaning East Indian trees, with alternate leaves, the tubular stipular of a Ficus, and axillary flowers



2105 *Rottlera* Named by Roxburgh, in honor of the Rev Dr Rottler, an East Indian botanist of reputation, who resided many years at Tranquebar in the character of a Danish missionary Rottlera tinctoria is a native of the inland mountainous parts of the Circars of Hindostan, flowering in the cold season Dr Roxburgh never found it any where else This is a middle-sized, erect, branching tree Leaves alternate, stalked, elliptic, oblong, acute, entire, from four to eight inches in length, three-ribbed, and veiny, nearly smooth above, downy beneath, furnished at their base with two brown glands Footstalks round, downy, from one to three inches long Flowers small, in clusters about the tops of the branches, axillary, and terminal, the latter branched Capsules the size of a small cherry, clothed with abundance of deep red granular powder, easily rubbed off This powder is a valuable article of commerce, being much esteemed, especially among the Moors, for dyeing silk of a deep, bright, very beautiful and durable, full orange or flower color. When the capsules are ripe, in February or March, they are gathered, and the powder carefully brushed off It is preserved without any further process, and is sold to the merchants trading to Hydrabad and other inland parts This substance is but little acted upon by water, except with the admixture of alkaline salts, when it gives out a very deep blood-red color To spirits it communicates a rich, deep, reddish flame color, but in neither instance does it dissolve, the grains remaining entire, like sand The inhabitants know this powder by the name of *Wassunta-gunda*, and use it in the following manner — To four parts of *Wassunta-gunda* are added one of alum, and two of salt of soda, native barilla These are rubbed well together, with a portion of expressed oil of Sesamum, so small as hardly to be perceived When well mixed, the whole is put into boiling water, in quantity proportioned to the silk which is to be dyed, and kept boiling smartly, more or less time, according to the shade required The silk is turned frequently, to render the color uniform

2106 *Cliffortia* Named in honor of George Cliffort, a Dutch gentleman; a great lover of plants, and one of the earliest of Linnæus's patrons He had a superb garden at Hartecamp, of which Linnæus published the catalogue in one volume folio, in 1737 Shrubs of little beauty, except C pulchella, which is exceedingly pretty, they are easily cultivated in a good greenhouse

History, Use, Propagation, Culture,

2107 *Cycas* A name employed by the ancients to designate a little palm which grew in Ethiopia The modern plant is analogous to it This genus, which seems intermediate between palms and ferns, produces the nutritive granulated powder called sago, from *sagu*, the name of a sort of bread made from the pith of the trunk in Tonquin It is cultivated in China and Japan, and the fruit is eaten in the latter country The tree, however, is chiefly valued for the pith of its trunk, which is full of white pith like that of the elder. The tree being cut down, this pith is beaten with a wooden pestle in a great mortar or trough, it is then strained, and the sediment, without farther preparation, constitutes sago. The native Indians live wholly upon it for three or four months in the year That which is transported is dryed and granulated In our stoves these plants require the culture common to all the palm tribe, a rich loamy soil, plenty of pot-room, and a strong moist heat

2108 *Zamia* From ζημια, loss or damage Pliny applied the name to the pine-cones of the fir, which, when suffered to decay upon the tree, injured the succeeding crop The modern genus bears heads of flowers very like pine cones

2109 *Latania.* The name of this plant in the Isle of Bourbon is *Latanier* L borbonica is a middle-sized palm with plaited fan-like fronds, which from the elongation of the axis and terminal lobe, seems as if pinnate When young their middle nerve is downy, it afterwards becomes naked The stalks of the leaves are spiny. The other species, L rubra, is a much smaller plant, and is remarkable for its red livid leaves

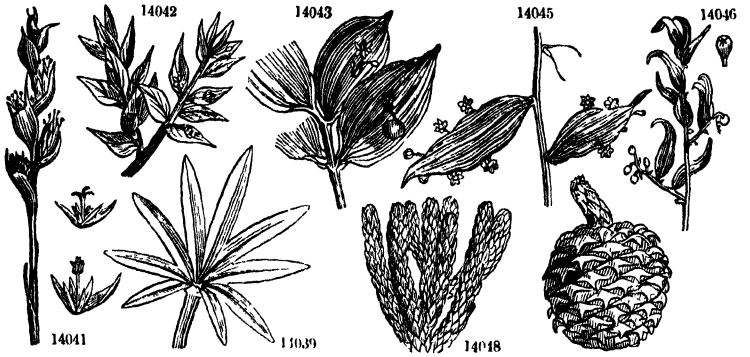
2110 *Leptocarpus* From λεπτος, smooth, and καρπος, fruit, with reference to the polished surface of the seeds Rushy plants allied to Restio, and all natives of New Holland and the South Seas

2111 *Ruscus* Anciently *bruscus*, and derived, it is said, from *beus*, box, and *kelem*, holly, in Celtic; box-holly The French at this day call one species *buis-épineux* and *petit-houx* R aculeatus has thick white twining roots, which strike deep into the ground, and send out fibres like those of asparagus The stem is suffruticose, tough, stiff, and dark green, having many stiff sharp prickly pointed leaves From the middle of the leaf above, comes out a single flower, on a very short pedicel: when it first appears it is the size and shape of a small pin's head, when expanded, composed of three outer calyxed leaves, and three inner ones con-

14019 Leaves ternate veinless smooth roundish elliptical the middle one smaller obcordate
14020 Leaves ternate fascicled veiny hairy lateral lanceolate entire, middle one obovate 3-toothed
14021 Leaves ternate linear villous

14022 Fronds pinnated, Leaflets lanceloate linear acute 1-nerved flat
14023 Fronds pinnated, Leaflets linear mucronate 1-nerved revolute at edge

[unarmed
14024 Fronds pinnat Leafl subul spread straight rigid mucron · outer margin of base rounded, Stalk roundish
14025 Fronds pinnated, Leaflets linear mucronate distichous lower opposite, Stalk ½-round channelled downy
14026 Fronds pinnated, Leaflets linear entire with a callous end twice emarginate obtuse, Stalk ½-round
14027 Fronds pinnated, Leaflets linear lanc blunt obsoletely serrulate at end and flat, Stalk 3-cornered smooth
14028 Fronds pinnated, Leaflets lanc acute pointless serrated at end, Stalk 3-cornered smooth
14029 Fronds pinnat Leafl lanc rounded blunt narrow at base serrul on outside at end, Stalk smooth nearly sq
14030 Very smooth, Leaflets of 16 pairs ovate oblique imbr serr at end, Stem round, Ament ovate nodding
14031 Fronds pinnated, Leafl lanc ac pointless serrat from middle to end chaffy beh Stalk roundish spiny below
14032 Fronds pinnated, Leaflets in 30-40 pairs falciform outwards with 3 or 4 prickly teeth at the end [smooth
14033 Fronds pinnat Leafl frost. glauc lanc ac point with spiny teeth in midd on outside, Stalk sq and trunk
14034 Leaflets oblique linear-lanceolate subulate hairy curved with 1 or 3 spines at the end and none on stalk
14035 Leaflets linear entire obtuse of 20 pairs, Stem round unarmed scurfy at base [woolly
14036 Leafl oblique lanc acute mucron in midd on outside with 2 spiny teeth smooth, Stalk squ smooth, Trunk
14037 Leaflets oblique lanceolate distichous acute pointless entire, Stalk smooth bluntly 4-cornered
14038 Leaflets oblique linear somewhat sulcate 3-toothed at end smooth, Stalk ½ round channelled



MONADELPHIA.

14039 Fronds plaited flabelliform, Leaflets spiny serrulate, Stalk unarmed
14040 Fronds plaited flabelliform elongated in the middle, Leaflets smooth at edge, Stalk spiny

14041 Spike divided, Catkins oblong somewhat squarrose, Scales cartilaginous acuminate, Culm simple

14042 Leaves mucronate pungent flower-bearing on their upper side and naked
β Leaves elliptical acute at each end, Branches weak
14043 Leaves bearing flowers on their underside naked
14044 Leaves bearing flowers on their upper side under a leaflet
14045 Leaves bearing flowers at their edge
14046 Raceme terminal hermaphrodite

14047 Leaves about 8 imbricated ovate-lanceolate mucronate perennial
14048 Old leaves closely imbricated inflexed pointless

and Miscellaneous Particulars.

sidered as petals Mr Woodward remarks, that the flower does not properly grow out of the leaf, but on a pedicel from the bosom of the leaf, which is immersed beneath the outer coat, whence it may with ease be dissected The female flowers are succeeded by red berries, almost as large as some cherries, they are sweet tasted, with two large orange-colored seeds in each The green shoots were formerly used by butchers for sweeping their blocks, whence the common English name of the plant It is still made into besoms in Italy The tender growths, soon after they have sprung up from the root in spring, have been gathered and eaten by the poor like those of asparagus, and the branches, with the ripe fruit on them, were formerly stuck up in sand, with the stalks of Peony and Iris, displaying their capsules of ripe seeds, the three together made a sort of winter nosegay for rooms In landscape gardening the plant is valuable as an evergreen, which will grow under the shade and drip of other trees It harmonizes well with Daphne Laureola, and Ulex nana, and Vaccinium vitis idæa R hypophyllum has the flowers on the under side of the leaves, which are succeeded by small red berries about the size of those of Juniper R racemosus is an elegant evergreen shrub, by some supposed to be the plant with which the ancients crowned their victors, but the more general opinion is in favor of Laurus nobilis All the species are readily increased by suckers from the root

2112 *Araucaria* The inhabitants of Chili call this noble ornament of their forests *araucanos* A. excelsa, the Norfolk Island pine, is a most superb plant, growing to an enormous size, and never losing the bright imperishable foliage with which it is covered, as with a coat of mail This genus, Sweet observes, " may be termed the handsomest genus of plants with which we are acquainted A. imbricata, in particular, is certainly one of the grandest plants known It will thrive well in the open air, with the protection of a mat or two in very severe weather, and when got pretty large, will, no doubt, be perfectly hardy A. excelsa, or Norfolk Island pine, is also a beautiful tree, but will not do without the protection of a greenhouse An equal mixture of sandy loam and peat will suit them very well, and cuttings may be rooted, though with difficulty, taken off at a joint in ripened wood, and planted in a pot of sand, which must be put under a hand-glass, in the propagating house but not plunged in heat " (*Hot Cult* p. 136)

History, Use, Propagation, Culture,

2113 *Juniperus* From the Celtic *jeneprus*, which signifies rough, or rude *Sandarach*, the name of a resin produced by the Juniper, is, according to Gelius (p 125), an alteration of the Arabic word *sandaroûs* The species, with only one or two exceptions, are close conical-growing evergreen shrubs or trees The timber of J Barbadensis and Bermudiana is imported from the West Indies under the name of Bermudas Cedar J Virginiana grows in the West Indies, the North American continent, and in Japan It is one of the highest timber trees in Jamaica, affording very large boards of a reddish brown color, close and firm contexture, shining, very odoriferous, and bitter to the taste It is imported into this and various other countries for the purposes of the cabinet-maker, as it is offensive to most insects. J communis is common in all the northern parts of Europe, in fertile or barren soils, on hills or in vallies, in open sandy plains, or in moist and close woods On the sides of hills its trunk grows long, but on the tops of rocky mountains and on bogs it is a tufted shrub In England it is found chiefly on open downs in a chalky or sandy soil In Scotland it is found in granite, trap and schistous hills and mountains, but not in the highest summits of the latter In the south of Europe it is only found in elevated situations, it abounds in the Alps of Switzerland, but is not very common in the Appennines In our shrubberies it forms a respectable looking conical bush, grouping and combining very well with cypresses, American cedars, and various species of the pine and fir tribe It is easily transplanted, and bears cropping Grass will not grow beneath it, but the Avena Pratensis is said to destroy it The wood is hard and durable, the bark may be made into ropes, and ardent spirits, impregnated with the essential oil of these berries, forms the true Juniper water or gin Various insects feed on this shrub, and it is eaten by horses, sheep, and goats, when they can get nothing better A gum oozes spontaneously from the trunk of old plants, which is Sandarach, and in its powdered form is known under the name of pounce Juniper berries require to remain two years on the tree before they are fully ripe The greater quantity of those which are used in Britain, are brought from Germany, Holland, and Italy They have a peculiar aromatic odor, and a sweetish, pungent, bitterish taste when chewed. In distillation with water, they yield a volatile terebinthinate oil of a greenish color, on which their virtues depend The flavor and diuretic properties of hollands depend on this oil, it is also supposed to be used for flavoring English gin, but for this purpose oil of turpentine is used Medicinally, Juniper berries are diuretic and cordial They have been long known as a remedy in hydropic affections, but they cannot be depended on alone, although they form an excellent adjunct to foxglove and squill. The tops yield the same essential oil as the berries, and may therefore be substituted for them (*Thom Lond Disp*)

J suecica is by some considered only a variety J sabina seldom produces flowers or seeds in our gardens Professor Pallas says, that in the Chersonesus Taurica, where it is very common, the savin is often found a foot and a half diameter, that it grows upright there, like a cypress, whereas by the Tanais it is procumbent the branches extending on the sand several fathoms, that the wood very much resembles that of J lycia, but has a more cadaverous smell, and the leaves are more fetid The leaves and tops of common savin have a strong, heavy, disagreeable flavor, and a bitter hot taste, with a considerable degree of acrimony These qualities depend on an essential oil, which is obtained in considerable quantity by distillation with water Both water and alcohol extract its active principles, and Lewis found that on inspissating the spirituous tincture, there remains an extract consisting of two distinct substances, of which one is yellow, unctuous or oily, bitterish, and very pungent, the other black, resinous, tenacious, less pungent, and subastringent Medicinally, savin is a powerful stimulant, possessing diaphoretic, emmenagogue, and anthelmintic properties It has certainly, however, a considerable effect on the uterine system, but, on account of its stimulating properties, is suited to those cases only of amenorrhœa which are unattended by fever, and in which the circulation is

14049 Leaves imbricated in 4 rows acute

14062 Leaves all imbricated in 4 rows younger ovate, old ones acute

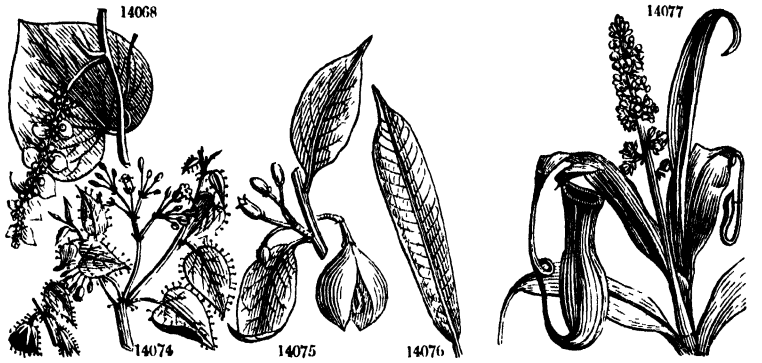
14063 Leaves thickly set linear distichous flat, Male receptacles globose

14064 Sheaths of joints 2-toothed blunt, Catkins 2–3 opposite stalked, Peduncles shorter than catkins
14065 Sheaths of joints 2-toothed blunt, Catkins solitary scattered or opposite, Peduncles longer than catkin
14066 Sheaths of joints bifid acum Male catkins clustered sessile or stalked, Fem solit stalk Branches spreading

14067 Leaves peltate subcordate ovate-orbicular silky beneath, Female racemes longer than leaves

and Miscellaneous Particulars

languid In plethoric habits, its use should be preceded by repeated bleedings, and at all times its internal exhibition requires caution It has been given in gout and worm cases also, but is seldom used. As an external local stimulant or escharotic, the dried leaves in powder are applied to warts, flabby ulcers, and carious bones, and the expressed juice diluted, or an infusion of the leaves, as a lotion to gangrenous sores, scabies, and tineæ capitis, or mixed with lard and wax as an issue ointment (*Thom. Lond Disp* p 342)



J. Lycia, which greatly resembles the savin, is commonly thought to produce the gum resin called Olibanum, though Dr Thomson and others consider the Boswellia Serrata of Roxburgh as the true plant Olibanum is supposed to have been the incense used by the ancients in their religious ceremonies, it is much employed by the Roman Catholics in their churches, and generally as a perfume in sick rooms

2114 *Taxus* According to Vossius this word is derived from *τοξος*, an arrow, because that weapon was formerly poisoned with the juice of the plant Yew seems to be an alteration of the Celtic *iw*, green T baccata inhabits mountainous woods in Europe, North America, and Japan Cæsar mentions it as very common in Gaul and Germany In Britain and Ireland there was formerly great abundance in a wild state, and planted in church-yards Ray says that our ancestors planted the yew in church-yards because it was an evergreen tree, as a symbol of that immortality which they hoped and expected for the persons there deposited Hence a custom, which still exists in a few places of Wales and Ireland, of carrying twigs of this and other evergreen trees in funerals, and throwing them into the grave with the corpse According to some, the yew was planted in church-yards on account of its utility in making bows, but this is by no means likely, when the tree was so common in a wild state, and when a single one would have afforded so very scanty a supply The bow was considered an engine of military warfare, at least up to the time of Henry VIII, so great was the demand for yew in the days of archery, that our own stock could not supply the demand; it was obliged to be imported, and various laws were passed concerning it from the time of Edward IV to Elizabeth The wood of the yew is red and veined, very hard and smooth, used by turners, cabinet-makers, millwrights, and a variety of other artisans. Flood-gates for ponds made of it, are said to be of incredible duration The twigs and leaves of yew, eaten in a very small quantity, are certain death to horses and cows, but deer, it is said, will crop these trees with impunity, and sheep and goats are said by Linnæus to eat them. Turkeys, peacocks, and other poultry and birds eat both the leaves and fruit A few of the berries are not deleterious to the human species, but the leaves are fatal The tree is very patient of the shears, and was much employed in the ancient style of gardening for verdant architecture and sculpture Allowed to take its natural shape, and when advanced to a considerable age, it forms one of handsomest of British evergreens, harmonizing admirably with the holly, the box, and the juniper The yew is generally propagated from seeds, which are either sown as soon as they are ripe, without clearing them from the pulp, or mixed with sand, and laid in a heap to be turned over two or three times during the winter, and in spring, the seeds from which the pulp will have rotted sown in beds, of light loamy soil By either mode, a part of the plants will come up the first season, and the remainder in that following The Irish yew is probably a distinct species

2115 *Ephedra* This was a name given by the Greeks to our Equisetum, which the plant now called Ephedra strongly resembles E. Distachya abounds in the southern parts of Russia, and from thence southwards to Persia and India The berries ripen in July and August · they are sweetish, mucous, and leave a little heat in the throat. They are eaten by the Russian peasants, and by the wandering hordes of all Great Tartary.

2116 *Cissampelos* From *κισσος*, the Greek name of the ivy, and *αμπελος*, vine, a plant partaking of the

History, Use, Propagation, Culture,

nature of the former in its foliage, and of the latter in its fruit. The roots of several species are said to have powerful medicinal qualities That of the C pareira, or *Parcira brava*, is bitter, diuretic, and aperient, of C. caapeba more mucilaginous.

2117 *Excæcaria* From *excæcare*, to blind The juice of this plant is so acrid as to cause loss of sight whenever it touches the eyes Agallochum, the produce of one of the species, was the name given by the the Greeks to an aromatic wood they obtained from India In Arabia it is called, according to Gollius, *âghâloüdjy*

2118 *Adelia* From α, privative, and δηλος, visible The parts of fructification are so minute as to be hardly visible A Bernardia derives its name from having been considered a distinct genus, and dedicated to the celebrated Bernard de Jussieu Bernardia is the name which ought to have been adopted for the genus Ugly uninteresting shrubs

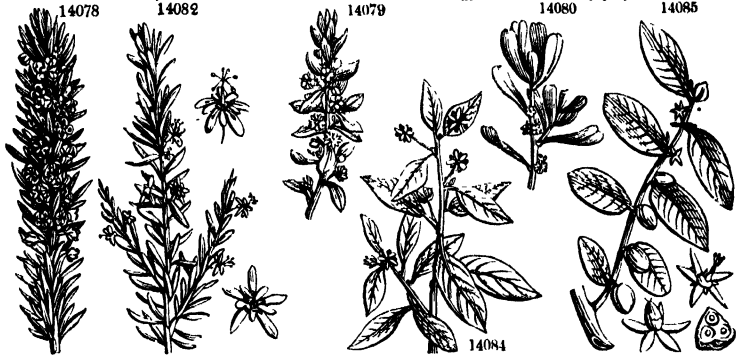
2119 *Loureira* Dedicated by Cavanilles to John de Loureiro, a Portuguese missionary, who travelled in China and Cochin-china, of which he published the Flora in 1790

2120 *Myristica* From μυρρα, myrrh, on account of the odor of the fruit. M. moschata produces spheroidal drupes, fleshy, smooth, and finally drying up into a coriaceous crust, and opening on one side Each berry contains an ovate, globular, serrated nut The arillus or cover, which is commonly called mace, is fleshy, coriaceous, and reddish-saffron colored Under this are two shells, the outer thin and brittle, and reticulated by the impressions of the mace the inner shell is membranaceous, and adheres very closely to the kernel The fruit would be a drupe was it not for the arillus

The nutmeg-tree yields three crops annually, the first in April, which is the best, the second in August, and the third in December, yet the fruit requires nine months to ripen it When it is gathered, the outer coriaceous covering is first stripped off, and then the mace carefully separated and dried in the sun The nutmegs in the shell are next exposed to heat and smoke for three months, then broken, and the kernels thrown into a strong mixture of lime and water, after which they are cleaned and packed up This process is necessary for their preservation, and with the same intention the mace is sprinkled with salt water There are several varieties of the tree, but that denominated the queen nutmeg, which bears a small round nut, is the best. They are imported in chests, which contain each from 100 to 140lbs weight, the mace comes in chests also of different sizes The essential oil which is obtained in Banda by the distillation of the nut is brought

14068 Leaves somewhat orbicular cordate at base 7-nerved or little downy, Fem racemes the length of leaves
14069 Lvs ovate bluntish smooth on short stalks, Racemes much branched, male ? scarcely longer than petiole

14070 Monœcious diandrous, Leaves oblong serrated



14071 Leaves oblong downy serrated
14072 Leaves obovate entire
14073 Leaves oblong blunt entire fascicled, Spines axillary

14074 Leaves cordate glandular on the limb

14075 Leaves oblong acuminate smooth, Veins simple, Fruit solitary smooth
14076 Leaves oblong lanceolate with starry down beneath, Veins simple, Fruit racemose downy

14077 Leaves sessile, Pitchers cylindrical, Flowers panicled

14078 Leaves sessile linear lanceolate acute, Flowers axillary solitary
14079 Leaves sessile obovate acute, Peduncles about 3-fl axillary
14080 Leaves subsessile lanceolate obovate, Flowers axillary solitary
14081 Leaves subsessile linear-lanceolate acute thickish, Flowers axillary twin
14082 Leaves stalked linear blunt mucronate revolute at edge, Flowers axillary subsolitary on long stalks
14083 Leaves elliptical blunt densely downy on each side, Flowers axillary solitary sessile
14084 Leaves stalked ovate acute smooth, Flowers n. 3s axillary
14085 Leaves stalked elliptical blunt somewhat retuse smooth shining, Flowers axillary polygamous about 3

and Miscellaneous Particulars

in bottles, and the expressed oil in stone jars Nutmegs are frequently punctured and boiled in order to obtain the essential oil, and the orifices afterwards closed with powdered sassafras The fraud is detected by the lightness of the nutmeg The nutmeg has a fragrant, agreeable, spicy odor, and a warm aromatic taste

As the medical properties of nutmeg and mace depend on the essential oil they contain, they agree in these circumstances, and both are stimulant, carminative, and, in large doses, narcotic Mace is more generally used as a culinary spice, but the nutmeg and its volatile oil are in frequent use to cover the disagreeable taste of other medicines, and are sometimes ordered in cases of languor, vomiting, and diarrhœa, and in flatulent colic On account of the narcotic property of the oil, nutmeg should be cautiously employed in apoplectic and paralytic habits. In India its dangerous effects have been frequently felt, and in this country instances have occurred in which the nutmeg, taken in large quantity, produced drowsiness, great stupor, and insensibility, and on awakening delirium, which alternated with sleep for several hours (*Thom Lond. Disp* p 395)

M fatua is a branching lofty tree, the branches long, tortuous and declining, the leafy and flowering branches downy and ferruginous, and the flowers in axillary and terminal clusters The fruit varies in size and form on different trees, but is generally oblong, and about as long as a pigeon's egg From the kernel is extracted a species of yellowish suet or fat, which serves for various medical and economical purposes, and is made into candles From the wounded bark flows a red acrid juice The plants are at present rare in British collections · they grow in light loam and peat, and may be increased by cuttings in sand under a bell-glass.

2121. *Nepenthes* The name under which Homer speaks of a substance, which appears to have been opium. It is impossible to conceive in what sense the word has been applied to the plants now bearing the name They are the famous pitcher-plants of China and the East Indies, which bear leaves, the extremities of which are hollowed out into cup-like appendages, which are generally filled with water, which seems as if confined within them by a little lid, by which the pitchers are surmounted The cultivation of the plants is extremely difficult. It requires a very damp atmosphere, much heat, and perhaps, not much light. They are managed more successfully by Loddiges of Hackney, than by any cultivators in this country

2122. *Clugtsa* Named by Boerhaave, after Outgers Cluyt, or Augier Clutius, a Dutchman, and professor of botany at Leyden. He published, in 1634, a little tract upon the Cocoa-nut of the Maldives, which he called nux-medica The species are of little beauty or interest, and of the easiest propagation and culture

Class XXIII. — POLYGAMIA.

Flowers either male, female, or hermaphrodite, upon the same or different plants.

This class differs from the two preceding in having not only the sexes in different flowers upon the same individual as in Monœcia, or upon separate individuals as in Diœcia, but also combined in one flower, mixed among those which are unisexual It may, therefore, be considered to contain those genera which are in a state of transition from the common hermaphrodite structure to absolute unisexuality

To the first of its orders are referred several grasses, which are excluded from the early classes *on* account of the separation of their sexes, it also contains the numerous tribe of Mimosas, so well known for *their* various properties as objects of food, of ornament, of medicine, or of curiosity The maple is also stationed in the first class, as are a few genera of palms

The most important genera of the second class, besides the poetical Palmetto, are the ash and the fig Gleditschia and Ceratonia, two families of Leguminosæ, are valuable, the former for its light, airy, elegant foliage, and the latter for its sweet pods, which are used in Spain, in great quantities, as fodder for cattle

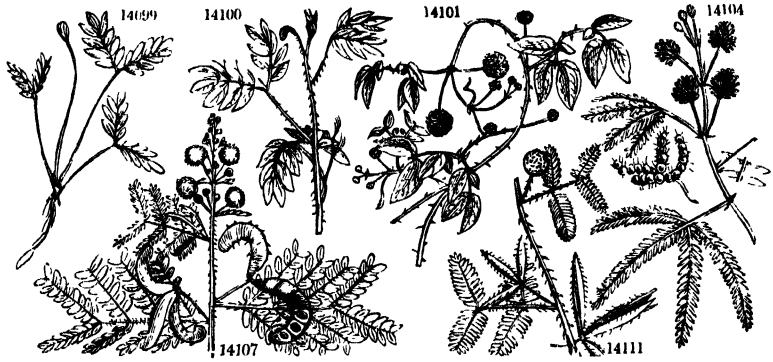
History, Use, Propagation, Culture,

2123 *Inga.* This is an American name adopted by Marcgraaf A fine genus of plants, remarkable for their beautiful foliage and flowers, but in cultivation they seldom blossom I purpurea is a remarkably elegant plant, and so is Inga bigloboso I unguis-Cati, the Cat's claw, Mimosa, is so called from the form of its curved spines. All the species require the greatest heat of the bark stove, they increase very slowly by cuttings

2124 *Mimosa* Said to be derived from *μιμος*, a buffoon, because the leaves of the sensitive species appear as if to play with the hand that touches them



The cause of the well known motion in the leaves of the sensitive plant, has been the subject of many ingenious explanations, but it has not been treated by any botanist with so much ingenuity and address as by Dr Dutrochet, whose theory we give, as explained by Mr Lindley in the Botanical Register M Dutrochet states, that having ascertained hot nitric acid to possess the power of separating and reducing to its simplest form the whole mass of vegetable tissue, and that the action of the same acid produced other effects equally advantageous for the examination of the most obscure parts of vegetable structure, he was induced to give his attention to that of the Mimosa pudica, in the hope of gaining some evidence respecting the cause to which its sensibility is to be ascribed Beginning with the pith, he observed a considerable number of minute globules of a greenish color, intermingled among the cells, and adhering to them in an irregular manner After attempting to shew the probability of these globules having deceived M. Mirbel in various points of his analysis of vegetation, and especially in regard to the pores, which that botanist supposes to exist in the cellular tissue of plants, Dr Dutrochet proceeds to remark, that the application of hot nitric acid to these globules renders them perfectly opaque, whence he concludes, that they are, in fact, minute cells filled with a particular fluid, which is subject to become concrete by the application of acids Now, it is known, that such fluids as are thus altered by acids, are usually dissolved and liquefied again by the application of alkalies A few drops, therefore, of a solution of hydrate of potash were suffered to fall upon a portion of the pith on which nitric acid had been acting, and the mixture was exposed to the heat of a lamp Being examined after a few minutes, the globules were found to have resumed their natural appearance This curious fact indicated, in the opinion of Dr Dutrochet, a strong and unexpected point of analogy between plants and animals According to the microscopical researches of some modern observers, it has been ascertained that all the organs of animals are composed of a conglomeration of minute corpuscles, similar to those just described, the corpuscles which constitute the muscles are soluble in acids, but those which compose the nervous system are insoluble in the same acids, and only soluble in alkalies Now, as the chemical properties and the external appearance of the particles scattered among the cellular tissue of plants, and constituting the nervous system of animals, are the same, the author is induced to infer, that the spherical particles of plants are, in fact, the

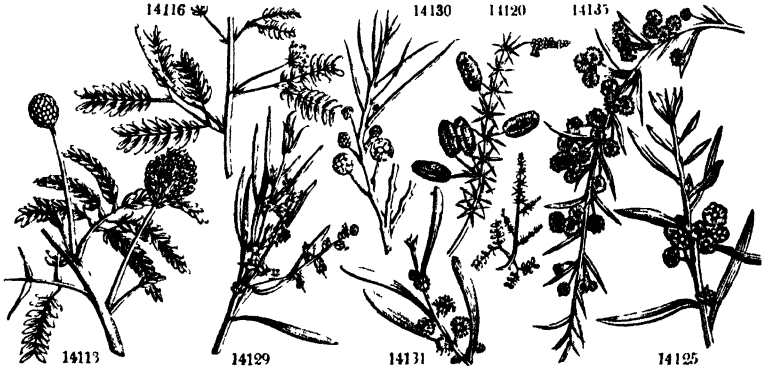
14094 Spines stipulary recurved, Leaves of 2 pairs, Leaflets halved obovate, Pod ensiform straight
14095 Unarm Lvs pinn of 2 pairs, Leafl obov obl unequal sided smooth, A gland between the lowest small ones
14096 Unarmed, Lvs conjugate pinnate, Leaflets ov obl term opp lateral alternate, Flowers in lateral umbels
14097 Unarmed, Lvs conjugate pinnate, Leafl obl blunt uneq at base, Petioles without glands, Heads stalked
14098 Spines stipular, Lvs conjugate pinnate, Pinnæ of 3 pairs, Leaflets ovate acute smooth, Pods spirally twisted

14099 Unarmed herbaceous, Leaves conjugate pinnate, Pinnæ 4 pairs, Leaflets roundish, Pods with one joint
14100 Prickles of branches and stems scattered hooked, Lvs bipinn ciliat and rough, Sutures of pods very spiny
14101 Stem and petioles prickly, Leaflets nearly halved ovate acute hairy beneath smooth above
14102 Spines of petiol scatter very broad compr straight, Lvs. bipinn finally smooth without glands, Leafl 10-15
14103 Stem and petioles prickly, Leaflets halved cordate ovate blunt smooth
14104 Stem prickly more or less hispid, Leaves digitate-pinnate, Pinnæ 4 of many pairs, Leaflets linear
14105 Stem aculeate smooth hairy upwards, Leaves digitate-pinnate, Pinnæ 5 of many pairs, Leaflets linear
14106 Like M asperata, but less hairy
14107 Prickles of branches and stems scattered hooked, Leaves bipinnate, Pinnæ of 5 pairs, Leaflets 20-25 lin
14108 Leaves bipinnate, Pinnæ of 8-12 pairs, Leaflets of many pairs bristly ben Peduncles twin as long as head
14109 Prickly, Leaves bipinnate partial of 6 pairs, proper of many pairs cultrate, Gland of petiole depressed
14110 Lvs bipinnate terminated by a tendril, Pinnæ of 2-3 pairs, Leaflets oval emarg Spikes numerous fascicled

14111 Prickly, Leaves bipinnate partial of 3 pairs, proper of many pairs, Pods acute, Stem 4 cornered
14112 Prickly, Leaves bipinnate partial of 6 pairs, proper of many pairs, Pods acute, Stem 5-cornered

and Miscellaneous Particulars



scattered elements of their nervous system This hypothesis receives additional strength from the great similarity which exists between the medullary substance of the brain of Mollusca Gasteropoda and the cellular medullary tissue of plants In pursuit of this idea, Dr Dutrochet made a variety of experiments upon the sensitive plant, the results of which seem to be these — The principal point of locomotion, or of *mobility*, exists in the little swelling which is situated at the base of the common and partial petioles of the leaves, this swelling is composed of a very delicate cellular tissue, in which is found an immense number of nervous corpuscles, the axis of the swelling is formed of a little fascicle of tubular vessels. It was ascertained by some delicate experiments, that the power of movement, or of contraction and expansion, exists in the parenchyma and cellular tissue of the swelling, and that the central fibres have no specific action connected with the motion It also appeared that the energy of the nervous powers of the leaf depended wholly upon an abundance of sap, and that a diminution of that fluid occasioned an extreme diminution of the sensibility of the leaves Prosecuting his remarks yet further, the author ascertained, that in the motion of the sensitive plant, two distinct actions take place, the one of locomotion, which is the consequence of direct violence offered to the leaves, and which occurs in the swellings already spoken of, the other of nervimotion, which depends upon some stimulus applied to the surface of the leaflets, unaccompanied by actual violence, such as the solar rays concentrated in the focus of a lens As in all cases, the bending or folding of the leaves evidently takes place from one leaf to another with perfect continuity, it may safely be inferred, that the invisible nervous action takes place in a direct line from the point of original irritation, and that the cause by which this action of nervimotion is produced, must be some internal uninterrupted agency This was, after much curious investigation, determined by the author to exist neither in the pith, nor in the bark, nor even in the cellular tissue filled with nervous corpuscles, and on which, he supposes, the locomotion of the swelling at the base of petioles to depend It is in the ligneous part of the central system, in certain tubes supplied with nervous corpuscles, and serving for the transmission of the sap, that Dr Dutrochet believes he has found the true seat of nervimotion, which he attributes to the agency of the sap alone, while he considers the power of locomotion to depend upon the nervous corpuscles alone

Some of the species ripen seed, others may be increased by cuttings from the points of the young shoots planted in sand and kept closely covered.

The pods of M fagifolia contain a sweet whitish pulp, which the natives of Martinique suck, they call the tree and its fruit *Pois Doux*, or sweet pea.

2125 *Schrankia* Named by Willdenow, in honor of his countryman, Francis de Paula Schrank, a well known German botanist. Herbaceous prickly shabby-looking plants, with the habit of Mimosa.

History, Use, Propagation, Culture,

3126. *Desmanthus* From δεσμος, a bond, and ανθος, a flower, on account of the fascicles of flowers, which seem as if bound up together These plants are chiefly aquatic, a few are prickly, and they all have the habit of Mimosa D natans is used in China as a pot-herb, and is described by Loureiro, under the name of Neptunia oleracea Willdenow, the author of the genus, observes, that the neuter florets have always a different color from that of the hermaphrodites, whence the spikes appear parti-colored, by which character the genus may be known at a distance Culture as in Mimosa D natans should be grown in water

2127 *Acacia* This was the Greek name of some plant of the present genus, and not being appropriated, was taken by Willdenow, in his reformation of the old genus Mimosa, as the designation of one of his new divisions This is one of the most ornamental families of the greenhouse plants, and some are curious as well as beautiful A Julibrissin, the *Gul chruschum*, or rose of silk of the Persians, and the Gazia of Italian gardeners, is an elegant hardy tree with beautiful tufts of pink colored flowers, which resemble tassels of silken threads.

A Catechu and vera are used in medicine The inner wood of the former tree is of a brown color, from which the catechu is thus prepared "After felling the trees, the manufacturer carefully cuts off all the exterior white part of the wood The interior colored part is cut into chips, with which he fills a narrow-mouthed unglazed earthen pot, pouring water upon them until he sees it among the upper chips, and when

and Miscellaneous Particulars.

this is half evaporated by boiling, the decoction, without straining, is poured into a flat earthen pot, boiled to one-third part, and then set in a place to cool for one day The decoction is afterwards evaporated by the heat of the sun, stirring it several times in the day, and when it is reduced to a considerable thickness, it is spread upon a mat or cloth, which has previously been covered with the ashes of cowdung The mass is lastly divided into square or quadrangular pieces by a string, and completely dried by turning them in the sun, until they are fit for sale This extract, when first introduced as a medicine into Europe, was named Terra Japonica, from the supposition that it came from Japan and was an earth "

Medicinally catechu is one of the most valuable of the vegetable astringents, and as the dark colored contains the greater quantity of tannin, on which its astringency depends, it is to be preferred for medicinal use It is employed with the best effects in dysentery and diarrhœa, when the use of astringents is admissible, in alvine and uterine hæmorrhages, leucorrhœa, gleet, and in obstinate catarrhal affections. As a local astringent, it is used in sponginess of the gums, and aphthous ulcerations of the mouth and fauces, and we have found the slow solution of a small piece of it in the mouth, a certain remedy for the troublesome cough induced by a relaxed uvula hanging into and irritating the glottis. Dr. Paris recommends it as a dentifrice, especially when the gums are spongy

A vera produces the gum arabic of the shops. The tree is found in almost every part of Africa, but those

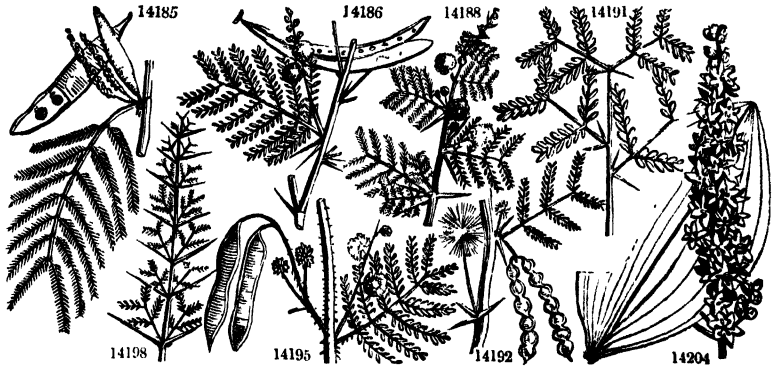
History, Use, Propagation, Culture,

which yield the gum which is exported from Barbary to Great Britain, grow principally in the Atlas mountains It is a hard withered looking low tree, with a crooked stem, and a grey bark The gum exudes naturally from the bark of the trunk and the branches, in a soft, nearly fluid state, and hardens in the air without losing its transparency It is collected about the middle of December It has a faint smell when first stowed in the warehouses, and is heard to crack spontaneously for many weeks

Medicinally gum exerts no action on the living system, but is a simple demulcent, serving to lubricate abraded surfaces, and involve acrid matters in the primæ viæ In the solid form it is scarcely ever given, unless to sheath the fauces, and allay the tickling irritation which occasions the cough in catarrh and phthisis pulmonalis; in which cases a piece of it is allowed to dissolve slowly in the mouth It is chiefly used in a state of mucilage.



According to Sweet, all the species of Acacia are of easy culture Those of the hothouse he recommends to be grown in loam and peat "Cuttings," he says, "of most kinds will strike root From the strongest growing kinds, take off large cuttings at a joint, and plunge them in a pot of sand under a hand glass in the bark-bed

and Miscellaneous Particulars.

Of the smaller kinds take younger cuttings, and put them under a bell-glass, also plunged in heat. The sooner the plants are potted off after they are rooted the better If they stay too long, the sand injures their roots they should be kept under a close glass, and shaded for a few days after potting off, and exposed to the air by degrees" (*Bot Cult* 11)

The greenhouse species are particularly valuable as flowering for the most part in winter, or early in spring, they are very hardy and grow freely in loam, peat, and sand well drained Cuttings of most kinds, Sweet observes, will root pretty freely, taken off in the young wood and planted in sand, under a bell-glass, and plunged in a little bottom heat. The kinds that do not root readily from cuttings may be increased by taking off roots, as large pieces as can be spared, and planting them in the same kind of soil as the old plants, when they should be plunged under a hand-glass in a little bottom heat. Most of the kinds might be propagated by that means. (*Bot Cult.* 126.)

2128 *Veratrum* Said by Lemery to be so called, because its root is *vere-atrum*, truly black. V album has a fleshy fusiform root, beset with strong fibres, gathered into a head, this root and every part of the plant is

History, Use, Propagation, Culture,

extremely acrid and poisonous It is used in medicine, and its properties are found to depend on veratrine, the same alkaline principle which is the active ingredient of colchicum Medicinally it is violently cathartic and sternutatory. When taken internally, even in moderate doses, its operation is violent and dangerous, producing besides hypercatharsis, with bloody stools and excessive vomiting, great anxiety, tremors, vertigo, syncope, sinking of the pulse, cold sweats, and convulsions, terminating, if the dose be large, in death Its external application to an ulcerated surface also produces griping and purging Notwithstanding these effects, Veratrum has been exhibited internally, and with advantage, in mania, epilepsis, scabies, lepra, and obstinate herpetic eruptions. But the most ordinary use of white hellebore is as a local stimulant. When taken internally as a poison, the best antidote is a strong infusion of nut-galls (*Thom Lond Disp* p. 545)

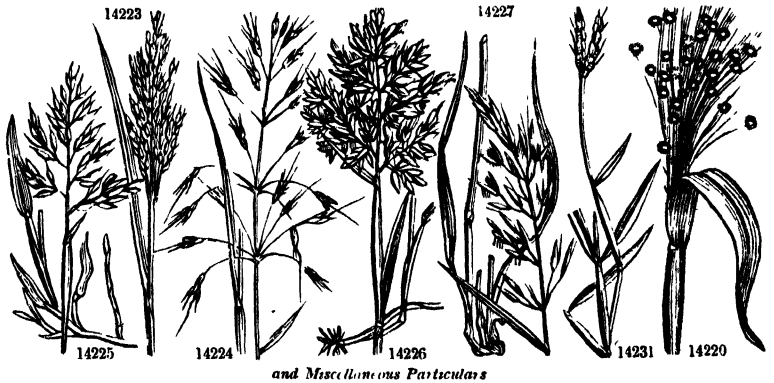
V. nigrum is very nearly allied to album, but differs in color, and seems not to be so strong and acrid in its qualities, for when both sorts are placed near each other, snails will entirely devour the leaves of this species, when they will scarcely touch those of the other.

2129 *Andropogon* From ἀνηρ, a man, and πωγων, a beard. A hyperbolical comparison of the little tuft of hairs upon the flower to the beard of a man A. schœnanthus has an agreeable smell, with a warm, bitterish, not unpleasant taste It was formerly brought over from Turkey in bundles about a foot long, and kept in the shops to be employed as a stomachic and deobstruent, but it is now little used All the species are of the easiest culture

2130 *Chloris* Derived from χλωρος, green, on account of the color of its herbage. Pretty little grasses, with beautiful one-sided spikes of silky flowers

2131 *Sorghum* *Sorghi* is the Indian name, according to Bauhin S vulgare, *grand millet*, Fr, *Saggena or Sorgo*, Ital, and *alcandia*, Span, is much cultivated in Arabia and most parts of Asia Minor It has been introduced into Italy, Spain, Switzerland, and some parts of Germany; also into China, Cochin-China, and the West Indies, where it grows commonly five or six feet high or more, and being esteemed a hearty food for labourers, is called Negroe Guinea corn. Its long awns or bristles defend it from the birds In England, the autumns are seldom dry and warm enough to ripen the seeds well in the field In Arabia it is called Dora or Durra. The flour is very white, and they make good bread of it, or rather cakes, about two inches in thickness The bread which they make of it in some parts of Italy is dark and coarse. In Tuscany it is used chiefly for feeding poultry and pigeons, sometimes for kine, swine, and horses Brooms are made of the spikes, which are also sent to this country for the same purpose. The Indian millet, as well as the common sort (Panicum), is cultivated in some parts of North America, and has been tried in this country, but it is only in the warmest autumns that it ripens its seeds. It might probably, however, be acclimated.

14205 Racemes panicled, Bractes shorter than peduncle, Petals with 2 glands at base
14206 Racemes supradecompound panicled, Bractes of branches linear-lanceolate very long
14207 Racemes panicled, Petals bearing the stamens on their claw



14208 Spike simple, Flowers twin hermaphrodite sessile awned, male stalked, Outer valve of cal nerved
14209 Spike simple, Lower flower beardless, Male and hermaphrodite calyxes hairy, Awns very long hirsute
14210 Spikes imbric conjug panic bract Fls in 3s midd. hermap beard. : beard smooth. lat. stalk male beardl
14211 Spikes twin terminal, Florets twin bearded hermaphrodite sessile, male bearded, Culm undivided
14212 Spikes digitate about 3, Florets alternate sessile beardless
14213 Spikes digitate about 8, Florets twin woolly at base. hermaphrodite sessile bearded; male stalked bearded

14214 Spikes 4-5-6 straight erect, Florets imbric. nearly smooth beardless, Outer valve of cal beard Culm compr
14215 Spikes digitate about 5 erect, Glumes ciliated
14216 Spikes many fascicled nearly erect, Florets subulate smooth
14217 Spikes many fascicled, Glumes ciliated bearded, Male valves ventricose bearded
14218 Spikes many alternate panicled pendulous, Spikelets 4-flowered

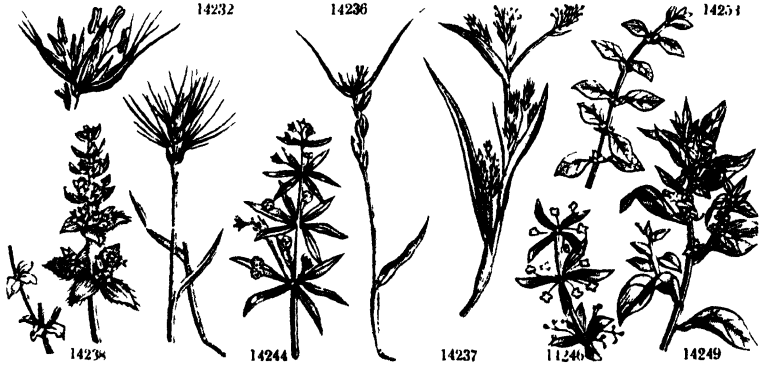
14219 Panicle contracted ovate, Florets strigose with down black, Seeds white round
14220 Panicle contracted oblong, Florets obovate shining hairy, Seeds compressed
14221 Panicle spreading, Florets oblong acute shining ciliated
14222 Panicle effuse, Branches spreading, Florets villous oblong, Leaves broad lanceolate
14223 Panicle spreading, Branches rough, Florets lanc. acute silky shining, Leaves lanceolate rough at edge

14224 Panicle effuse spreading, Branches whorled 3-fl Peduncles bearded, Leaves and sheaths hairy
14225 Glumes 2-fl hermaphrodite, Sessile floret beardless stalked bearded, Beard longer than flower
14226 Glumes 2-fl · hermaphrodite beardless, Beard of the male much shorter than flower recurved
14227 Male flowers with a jointed beard twice as long as calyx, Joints of culm smooth, Root nodose
14228 Male flowers with a jointed beard twice as long as calyx, Joints of culm villous, Root bulbous [Gm.
14229 Panicle spread. Glumes 3-fl. beardl Flor heaped hermap in midd dland.; male triand ciliat. *Hierochloe*

14230 Leaves lanc Florets naked, Outer valve of cal with 2 nodules on each side, Beard of cor long twisted
14231 Leaves lanceolate, Neuter florets intermediate wrinkled across two lateral smooth

and Miscellaneous Particulars

2132 *Holcus.* From ὀλκω, to extract. It was a popular notion among the ancients, that the leaves of the plant they called Holcus, which seems to have been a grass of some kind, had the property of extracting thorns from the flesh H. mollis is distinguished by its creeping roots, which, when once in possession of the soil, as Mr Sinclair observes, can hardly be again expelled without great labor and expence It is the true couch-grass of light sandy soils, and underground stolones have been found five feet in length, the growth of a few months only These root-shoots contain a very considerable quantity of nutritive matter, which has the flavor of new made meal. Pigs are very fond of the roots, and dig them up with eagerness, but the herbage is disliked by cattle, more than that of any other species of the genus, being extremely soft, dry, and tasteless. The best mode of banishing this weed from light arable lands, is to collect the roots with the fork after the plough. (*Sinclair, Hort Gram* 167)



H. lanatus has a fibrous root, and grows on all soils from the richest to the poorest, but attains to the highest degree of luxuriance on light moist peaty soils Cattle prefer almost any other grass to this, it is seen in pastures with full grown perfect leaves, while the grasses that surround it are cropped to the roots. Its nutritive matter consists entirely of mucilage and sugar, while the nutritive matters of grasses most liked by cattle are either sub-acid or saline Mr Sinclair suggests, that this grass might probably be made more palatable to cattle, by being sprinkled over with salt (*Hort Gram* 164)

H avenaceus, the Avena elatior of Linnæus, Curtis, and Host, is a bulky productive grass, eaten by horses, cattle, and sheep, but less nutritious than many other grasses. It pushes rapidly after being cropped; and though later in flowering than many other species, produces an early and plentiful supply of herbage in the spring These properties would entitle it to rank high as a grass adapted for the alternate husbandry, but its nutritive matter contains too large a proportion of bitter extractive and saline matters to warrant its cultivation, without a considerable admixture of different grasses, and the same objection extends to its culture for permanent pasture It is always present in the composition of the best natural pastures, and, as before mentioned, eaten in common with other grasses. It does not, however, constitute a large proportion of the herbage, but rather the least of any of the more valuable grasses that have been mentioned. (*Hort Gram.* p 171) This grass and Triticum repens are the two species eaten by dogs to excite vomiting One variety has bulbous roots, and is a noxious weed in arable lands

H odoratus is one of the earliest flowering grasses, but it is tender, the spring produce of herbage is inconsiderable, and its powerful creeping roots render it unfit for agricultural purposes. (*Hort Gram.* 169)

2133 *Ischæmum* From ισχω, to stop, and αιμα, blood Pliny says, that the Thracians first discovered that the woolly seed which is borne by the Ischæmum, if introduced into the nostrils, has the power of stopping the bleeding at the nose Useless grasses.

History, Use, Propagation, Culture.

2134 *Ægilops* From αιξ αιγος, a goat, and οψ, the eye. The ancients believed that the plant they named Ægilops had the power of curing a disease of one corner of the eye, which seems to have been what we call Fistula lachrymalis. The *Ægilops ovata* is a common Sicilian grass, when ripe, it is gathered by the peasantry, who tye the heads up in bunches, and set them on fire; they burn with rapidity, and so give the grains a slight roasting, which are then considered agreeable food.

2135. *Manisuris* Said to be so called, from μανος, relaxed, and ουρα, tail, or, in botanical langnage, a head of grass; because the spikes are loose, and not compact. A curious little plant remarkable for its wrinkled grains.

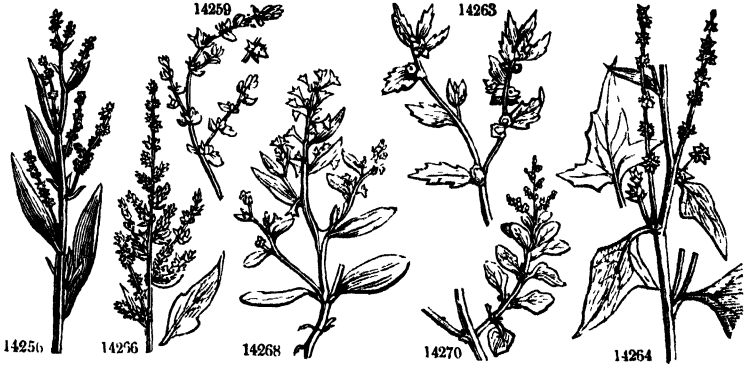
2136. *Valantia.* Miserable weeds of no beauty or use, called by their present name by Linnæus in reference to Sebastian Vaillant, a learned and excellent French botanist, who died in 1722 The author of the name would have employed his time better in considering the botanical writings of Vaillant, than in identifying with the most worthless part of vegetation an author whose merits he was not able to understand. No man was more given to sneers of this kind than Linnæus, and yet his followers manifest a most extraordinary degree of sensitiveness whenever he is retorted upon in a similar way, although few ever deserved criticism in some things in a higher degree than himself

2137. *Parietaria.* From *paries*, a wall. Weeds which are commonly found upon old walls, or rubbish heaps. P. officinalis presents some curious anomalies in its inflorescence and fructification. To obtain a perfect idea of

14232 Spike ovate, Cal. all with 4 beards scabrous, Culms ascending
14233 Spike cylind. Lower cal with 2 beards the rest with 3, Beards of 2 terminal florets longer than the rest
14234 Spike cylindrical, Cal with 1 beard, Cor beardless, Terminal beards very long
14235 Spike cylindrical, Cal 2-toothed beardless, Co.r with 1 beard
14236 Spike cylindrical, Cal 2-toothed : teeth unequal beardless, Valves of terminal floret with 1 valve only

14237 Valves of female fl. globose tessellated warted, Culm erect branched, Sheaths hairy

14238 Leaves 4 ellipt obl 3-nerved netted hispid, Peduncles branched smooth bracted, Fruit smooth
14239 Leaves 4 elliptical netted smooth, Male fl trifid attached to the base of the hermaphrodite
14240 Leaves 4 obovate-oblong veinless roughish, Male fl trifid attached to the base of the hermaphrodite
14241 Leaves 4 oblong ciliate toothletted netted smooth, Ovary oblong chaffy longer than pedicel
14242 Leaves 4 oblong ciliate hispid, Peduncle subbifid ciliated, Male fl trifid, Ovary smooth
14243 Leaves 4 oblong, Peduncles protected by the ovate deflexed bractea, Stem erect
14244 Leaves 6 linear lanceolate hispid at edge, Peduncle 2-fl naked, Male fl. trifid, Fruit warted



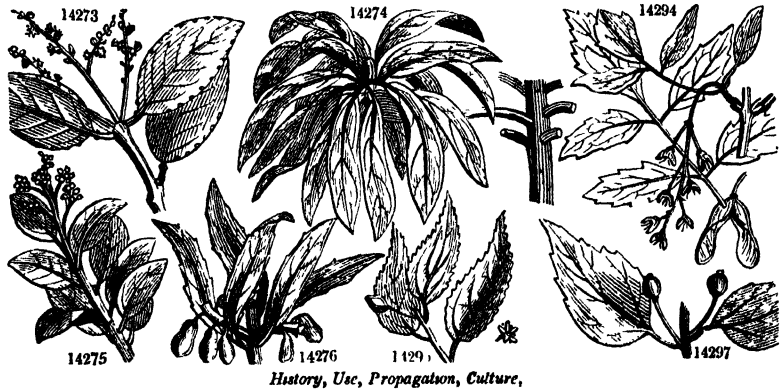
14245 Male fl. 4-fid, Peduncle dichotomous leafless, Leaves cordate
14246 Leaves 4 elliptical ciliated, Peduncle branched naked and fruit smooth
14247 Leaves 6 linear very rough at edge, Stalk and fruit hispid

14248 Leaves lanceolate, Stem erect
14249 Leaves oblong ovate acuminate at each end with pellucid dots, Peduncle dichotomous, Cal 2-leaved
14250 Leaves ovate, Stem erect, Involucre 3-flowered, Male corollas long cylindrical
14251 Leaves oblong lanceolate veiny with opaque dots, Involucre longer than flowers
14252 Leaves opposite stalked ovate serrated veiny downy, Flowers axillary
14253 Leaves roundish ovate obtuse the length of petiole, Stems uniform procumbent
14254 Leaves linear lanceolate subsessile hairy, Involucre longer than flower

14255 Stem shrubby, Leaves alternate or opposite oblong subrhomboid entire
14256 Stem shrubby, Leaves obovate-lanceolate entire silvery white
14257 Stem half-shrubby procumbent, Leaves ovate sessile entire lower a little toothed
14258 Stem shrubby erect, Leaves hastate entire acute, Spikes terminal
14259 Stem herb spreading, Leaves triangular hoary unequally toothed, Cal of fruit quadrangular toothed
14260 Stem herbaceous spreading, Leaves rhomboid somewhat toothed, Cal of fruit muricate toothed
14261 Stem herbaceous erect, Leaves oblong sinuated cuneate at base hoary beneath, Cal of fruit toothed
14262 Stem herbaceous erect, Leaves triangular toothed whole-colored, Cal of fruit ovate netted entire

14263 Stem herbaceous diffuse, Leaves ovato-deltoid dentato-sinuate very mealy beneath [tuberculat. at side
14264 Stem herb spreading, Lvs triang hast glab above irregul tooth · upp ones ent Cal of fr more or less
14265 Stem herb spread Lvs lanc ent lower ones somew hast Cal of fruit hastate slightly tuberculat at sides
14266 Stem herbaceous erect, Leaves ovate-lanceolate, lower sinuated, Cal of seeds muricated
14267 Stem herbaceous erect, Lvs all linear ent or toothed, Perianth of fruit sinuated and muricated on back
14268 Stem herbaceous flexuose spreading, Leaves obovate entire, Female flowers stalked cuneiform
14269 Stem herbaceous erect, Leaves triang hastate acutish a little toothed, Cal of fruit ovate acute entire

14270 Branches diffuse, Leaves nearly opposite rhomboid-hastate entire smooth, Spikes terminal leafless



and Miscellaneous Particulars

the manner in which this is carried on, the flowers should be examined at a very early period of their expansion. The manner in which the stamens shed their pollen is curious. The filaments on their first appearance all bend inwards; as soon as the pollen is arrived at a proper state to be discharged, the warmth of the sun, or the least touch from the point of a pin will make them instantly fly back, and discharge a little cloud of dust. This process is best seen in a morning, when the sun shines on a plant in July or August: if the plant be large, numbers will be seen exploding at the same instant. Mr Curtis remarks, that the same degree of cold (thirty-one Fahrenheit) which strips the mulberry of its leaves, will destroy the herbage of Parietaria. The ashes of the plant are said to contain a considerable quantity of nitre.

2138. *Atriplex.* The same name as Atraphaxis, which see. A. Halimus (ἅλιμος, maritime) grows on the sea-coast of the south of Europe, and in this country its silver-colored foliage adds to the variety of our shrubberies. A portulacoides requires to be planted on a poor gravelly soil, in its native state it prefers the seashore and salt marshes. A hortensis, sometimes called mountain spinach, was formerly cultivated as a culinary herb, and is still grown to a considerable extent in the neighbourhood of Paris, and the leaves gathered as spinach. There are several varieties more or less tinged with red or purple. The leaves of all the species may no doubt be used as pot-herbs.

2139 *Rhagodia.* From ῥαγώδης, bearing berries. New Holland shrubs with alternate leaves, and flowers growing in racemose spikes.

History, Use, Propagation, Culture,

2140 *Terminalia.* Because the leaves grow in bunches at the *termination* of the branches. The species grow in loam and peat, and ripened cuttings, with their leaves on, will root in sand closely covered.

2141 *Fusanus* The ancient name of the Euonymus. This plant resembles it in foliage A little Cape shrub, formerly included in Thesium

2142 *Brabejum.* From βραβεῖον, a sceptre The elegant racemes of splendid flowers may well be compared to a sceptre

2143. *Acer* A Latin word signifying vigorous or sharp The wood was formerly manufactured into the heads of pikes and other weapons The species consist of trees, most of them yielding a saccharine juice from the trunk, branches, and leaves A Pseudo-Platanus, *Plane tree*, Scot, grows wild in Switzerland, Germany, Austria, and Italy It is remarkably hardy, and will grow with an erect stem, exposed to the highest winds, or to the sea-breeze It is in leaf by the middle of April, and on their first appearance the leaves are of a pleasant green, but they exude a clammy juice so abundantly, that they attract a variety of insects, which soon perforate and disfigure them. The flowers of none of the species are of any beauty The shade of the tree is said to do less damage to pasture than most trees The timber was formerly much used by the turner, and is still in repute by the saddle-tree maker and the millwright. In spring and autumn, if the trunk be pierced, it yields abundance of juice, from which a good wine may be made, or sugar to a certain extent procured by evaporation A rubrum grows in swamps in Pennsylvania, where the natives use it for almost all sorts of wood-work, with the bark they dye a dark blue, and make a good black ink The Canadians tap the tree for the juice, of which they make sugar and treacle The scarlet flowers of this species come out in spring before the leaves, they are without petals, and have not more than six stamens

A saccharinum bears a considerable resemblance to A platanoides, especially when young. From this tree, and probably also from other species, the inhabitants of North America make a very good sort of sugar The trees are tapped in February, March, and April, during warm days and frosty nights The incision is made with an axe or auger, or about two inches deep A spout of sumach or elder is introduced, through which the sap flows, from four to six weeks, into a trough, whence it is carried daily to a larger receiver, from which it is conveyed after being strained to the boiler The boiling and refining process is or should be carried on in the same manner with that for the cane sugar in the West Indies A tree of an ordinary size yields in a good season from twenty to thirty gallons of sap, from which are made from five to six pounds of granulated sugar

A platanoides grows on the mountains of the northern counties of Europe, descending in some places of

14300 Leaves unequal at base ovate acuminate serrated smoothish on each side

and Miscellaneous Particulars.

Norway to the sea-shore It abounds in the north of Poland and Lithuania, and is common through Germany, Switzerland, and Savoy On a tolerable soil it attains a large size, and the leaves being smooth and of a shining green, as large or larger than those of the sycamore, and being seldom eaten or defaced, because the tree abounds in a sharp milky juice disliked by insects, they have a much better appearance than those of the sycamore, and in the spring, when the flowers are out, which are of a fine yellow color, this tree has great beauty Hanbury observes, that in the autumn the leaves die to a golden yellow color, which produces a good effect at that season, when the different tints of the decaying vegetable world are displayed He says further, that it is a quick growing tree arrives at a great bulk, and is one of the best trees for sheltering habitations. Linnæus recommends it for sheltering walks and plantations, as yielding a juice from which sugar may be made, if it be wounded in the winter, and as cutting out into a white smooth wood, fit for the stocks of guns, the joiner and the turner Dr Hunter observes, that it is a quick grower, arrives at a great bulk, and answers all the purposes of the sycamore, the raising it for use, as well as ornament and variety, should not be neglected (*Mill Gard Dict*)

A striatum has a slender stem, with a smooth bark beautifully varied with green and white stripes, the boughs of a shining red in winter The thickness of the shade, the beauty of the bark, and the tree not being liable to insects, render it very desirable for ornamental plantations; the only objections to it are, that it is subject to be injured by storms, and that the abundance of its foliage and seeds occasions a great litter in autumn

A campestre forms a very picturesque little tree, and the timber is said to be far superior to that of the beech or the sycamore for the purposes of the turner It is also frequently substituted for that of the holly and box by the mathematical instrument maker

A Opalus is a noble tree, with large and beautiful foliage, throwing an extensive shade, it is much prized in Italy for planting by avenues and public walks All the species are easily raised from seed, though the ash-leaved and some other species are occasionally propagated by layers and cuttings, the cuttings should be cut off at a joint, and, as in the case of most hardy trees and shrubs, they succeed best when planted in the autumn in a sheltered situation in the open ground

2144 *Negundum* A genus obviously distinguished from Acer by its pinnated leaves. A fine ornamental tree, called in North America black ash There is another species in China.

2145 *Celtis* One of the names anciently given to the Lotus Tournefort first applied the name to the modern genus, which may be said to resemble both in fruit and foliage the shrubby Lotus of the ancients.

History, Use, Propagation, Culture,

C australis, sometimes called the lote tree, is reckoned among the largest timber trees of the south of Europe. The wood is one of the hardest we are acquainted with, it is also very tough and flexible. In France, the forked branches are peeled, and cut so as to resemble rude hay-forks, and in that state used for various agricultural purposes. The leaves have a cheerful light green color, the berries are the size of a small cherry, first yellow and then black, they are eaten by birds and children

C occidentalis bears a great resemblance to the first The leaves come out late in the spring, but they are also the latest in fading of any of the deciduous sort, the timber is tough and pliable, and imported by coachmakers for the frames of their carriages It grows more freely in this country than the European species, and in some years bears abundance of fruit.

C orientalis is a low-spreading tree or bush, the timber is white, and yields a gum like that of the cherry

C. aculeata is an inelegant little tree, with a drupe double the size of a pea, which is eaten by the natives of the Caribbee Islands and the neighbouring continent All the species are easily increased by layers or seeds

2146. *Gouania* Antoine Gouan was professor of botany at Montpellier in the middle of the eighteenth century, and was a good botanist. The species are increased by ripened cuttings under a hand-glass in heat

2147 *Hermas* A name, the meaning of which is wholly unknown An inconspicuous starved-looking plant of no known use, whence it is called *depauperata*

2148 *Bridelia* Named in honor of Professor Bridel, the celebrated muscologist. Small bushes or trees, with little beauty to recommend them

2149 *Feronia* Elegantly named by the classical Correa de Serra, after Feronia, the goddess of the forests This is a noble Indian timber tree, bearing a fruit not unlike an orange, to which it is botanically related

2150 *Ailantus* Derived from *Ailanto*, the name of one species in the Moluccas The usual way of writing it, Ailanthus, is therefore incorrect. A glandulosa is a tree which may be compared to a gigantic stag's-horn sumach, it has very large leaves, unequally pinnate, with foot-stalks from one to two feet in length, and numerous flowers in a terminating pedicel, which exhale a disagreeable odor The tree grows very fast, and on very poor soil, especially if it be calcareous If the bark be wounded, a resinous juice flows out, which hardens in a few days The wood is hard, heavy, glossy like satin, and susceptible of a very fine polish It is propagated by cuttings of the roots In general the trees bear only male flowers, but in France it has produced both male and female flowers, and fruit twice in ten years.

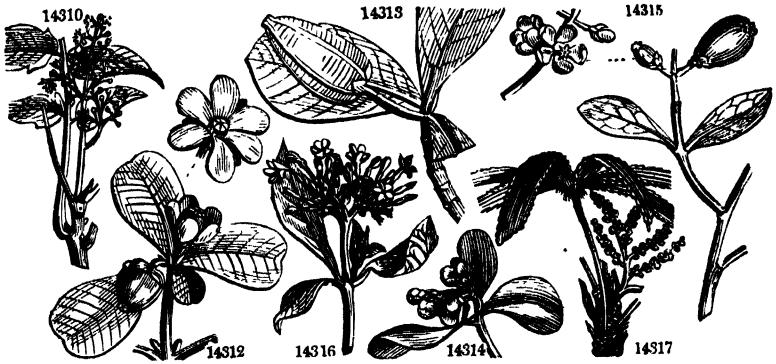
2151 *Clusia* So called, in honor of the celebrated Charles de l'Ecluse, born at Artois in 1526, and died in 1609 He was one of the most excellent botanists who ever lived, and author of many works whose value will only cease with the world But he is not more known for his mental excellence, than for his personal calamities In his early youth he undertook to travel through Portugal, Spain, England, Hungary, and other countries in pursuit of plants, no easy task in those days By excessive fatigue he contracted, so soon as in his twenty-fourth year, a dropsical complaint, of which he was afterwards cured with chicory by the celebrated

14301 Leaves broad ovate acuminate serrate smooth on each side
14302 Leaves ovate oblong acuminate serrulate unequally cordate at base rough above hairy beneath
14303 Leaves ovate oblong acuminate equally cordate at base entire obsoletely serrated at end smooth, Branches prickly

14304 Leaves ovate acuminate bluntly serrated smooth
14305 Leaves cordate-ovate with glandular serratures roughish, Racemes terminal downy

14306 Stem downy, Leaves oblong sessile toothed downy beneath
14307 Leaves lanceolate ovate woolly above downy beneath entire

14308 Shrubby erect spiny, Leaves ovate entire acute glabrous



14309 The only species

14310 Leaves pinnated with an odd one, Leaflets toothed at base, Teeth glandular
14311 Leaves abruptly pinnated, Leaflets serrated

14312 Leaves obovate blunt veinless, Cor hexapetalous twice as large as calyx
14313 Leaves obovate blunt veinless, Cor 5-7 petalous half as large again as calyx
14314 Leaves obovate blunt veinless, Cor 4-petalous twice as large as calyx
15315 Leaves obovate blunt veiny, Flowers tetrapetalous

14316 Leaves in fours

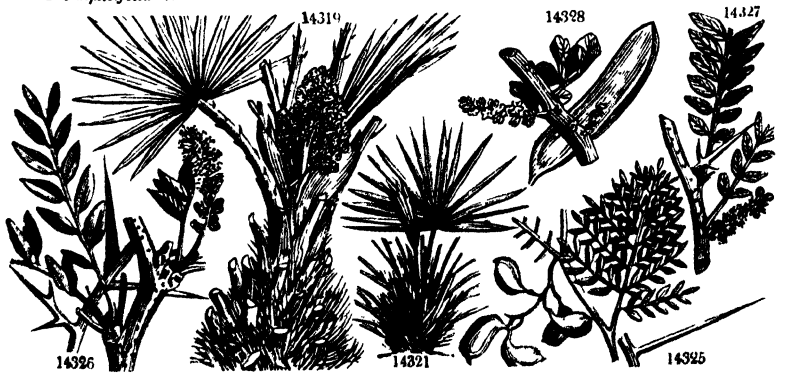
14317 Fronds palmate plaited, Plaits and margins prickly
14318 Fronds simple 2-parted, Lobes acute plaited, Plaits roughish

and Miscellaneous Particulars

Rondelet See Rondeletia. At the age of thirty-nine he broke his right arm, during one of his botanical rambles; and a short time afterwards his right thigh When fifty-five, he dislocated his left ancle while at Vienna, and eight years after his right hip. Having been unskilfully treated, he was ever after obliged to walk with crutches The consequent deprivation of his natural exercise brought on other diseases, among not the least distressing of which were calculus and hernia After having been the director of the Imperial Gardens of Vienna for fourteen years, he finally returned to his native country, Flanders. He was named professor of botany at Leyden, where he gave botanical lectures for sixteen years, when he died overwhelmed by the multitude of his bodily infirmities, but retaining his faculties unimpaired to the last.

The species are trees abounding in a tenacious glutinous juice, of a balsamic flavor, whence the English name C rosea has handsome flowers, in which the stamina and pistillum are covered with a gelatinous gluten. The fruit is green and of the size of a middling apple, with eight lines running, like meridians on a globe, from the stalk to the crown of it. When it ripens, it opens at these lines, and divides into eight parts, disclosing many mucilaginous scarlet seeds, resembling those of the pomegranate The whole tree is exceedingly beautiful, and the structure of the fruit is a most exquisite piece of mechanism. It grows on rocks, and frequently on the trunk and limbs of trees, occasioned by birds scattering or voiding the seeds, which being glutinous, like those of the misletoe, take root in the same manner; but the roots not finding sufficient nutriment, spread on the surface of the tree till they find a decayed hole, or other lodgment, wherein is some small portion of soil, the fertility of this being exhausted, a root is discharged out of the hole till it reaches the ground, where it fixes itself, and the stem becomes a large tree Roots have been known to do this at forty feet from the surface The resin is used to cure sores in horses, and instead of tallow for boats.

C alba is an elegant tree, and epiphytical on other vast trees, like the foregoing, the trunk is frequently a foot in diameter, and supports a spreading head The whole abounds in a balsamic juice, of a green color, but becoming of a brownish color on being exposed to the air The flowers are white, and of no great beauty, the fruit scarlet, with a scarlet pulp, the birds are very fond of them, hang over them on the wing, and pluck out the seeds with the pulp adhering.



C flava bears in all respects a considerable resemblance to the former. A very good idea of the progress of culture since Miller's time, may be formed by comparing his directions for propagating this plant, and those of Sweet Mr Miller says, the best way is to have them brought over in tubs from the West Indies: according to Sweet, the pots should be well drained, the soil for rooted plants should be a light sandy loam, and "cuttings root very freely in sand under a hand-glass."

2152 *Ophioxylon.* From ὄφις, serpent, and ξύλον, wood. In Ceylon they employ the plant in cases of the bite of serpents. It grows freely in a mixture of loam and peat, and may be increased by cuttings in sand under a hand-glass.

2153 *Rhaphis* So named by Loureiro, from ῥαφίς, a needle, on account of the acute awns of the corolla, which stick into the clothes. Culture as in the other palms; that is, abundance of heat and room, both for the roots and top.

History, Use, Propagation, Culture,

2154. *Chamærops* This word is said by etymologists to be synonymous with χαμαιδρυς, or χαμαιδρυη, a dwarf oak The modern genus consists of ornamental palms, which are fine hardy greenhouse plants.

2155 *Gleditschia* Called in honor of John Gottlieb Gleditsch, a native of Leipsig, and member of the academy of Berlin, and the author of several works, among which his Arrangement of Fungi, published in 1753, and his Botanical System, are the most remarkable G triacanthos, the honey locust of North America, attains the size of a large tree, but very seldom flowers and ripens its seeds in this country All the species grow in common garden soil, and are generally raised from seeds

2156. *Ceratonia* This name has been derived from κερας, a horn, in allusion to the long horn-like pods of this plant, which contain a sweet fœcula, for the sake of which they are often imported from Spain under the name of the Algaroba bean This last word is a slight alteration, by the prefix of the article *al*, of the Arabic name of the tree, *Kharroub*, whence also our English name *Carob-tree* This is generally considered the locust-tree of scripture, and in Spain, where the seeds are eaten, it is called Saint John's bread. Ignorance of eastern manners and natural history, Professor Martin observes, induced some persons to fancy that the locusts on which John the Baptist fed, were the tender shoots of plants, and that the wild honey was the pulp of the pod of the Carob, whence it had the name of Saint John's bread. There is better reason to suppose, he adds, that the shells of the carob pod might be the husks which the prodigal son desired to partake

14352 Leaves of 3 pair smooth, Leaflets subsessile ovate lanceolate toothed, Branches yellow
14353 Leaflets somewhat stalked lanceolate acuminate serrated smooth cuneate at base, Branches flat smooth

14354 Leafl somewhat stalked lanceolate acuminate serrate smooth, Branches found warted
14355 Leaves simple and compound tooth-serrated, Buds black

and Miscellaneous Particulars

of with the swine The tree is very common in the south of Spain, and the seeds or beans, as they were there called, often formed the principal food of the British cavalry horses during the war of 1811 and 1812 In our greenhouses the plant seldom flowers, but it grows very well in loam and peat, and ripened cuttings root in sand under a hand-glass

2157 *Fraxinus* The origin of this word is far from certain Linnæus says, it has been taken from the Greek φραξις, a separation, in allusion to the facility of splitting its wood De Theis remarks, that M. A Dureau de la Malle has proved, in a learned dissertation published in 1804, that the Fraxinus of the Latins and the Melia of the Greeks are our Ornus europæus, while the Ornus of the Latins and the Boumelia of the Greeks are, in fact, our Fraxinus excelsior, or common ash. *Le Frêne*, Fr, *Esche*, Ger, and *Frassno*, Ital. The English name is from the Celtic *æsc*, a pike. F excelsior is one of the most useful of our native timber trees It is peculiarly adapted for implements of husbandry, and the coachmaker and wheeler, it makes excellent fuel, with very little smoke, good hop-poles and hoops, excellent handles for tools, and very good walking-sticks Its period of leafing is very late, being seldom earlier than the last week of April, and not unfrequently about the middle of May the leaves have been used to adulterate tea, they are bitter, and said *to communicate a rank taste* to the milk and butter of cows which eat them The roots spread to a great extent and lie very near the surface, and these, together with the shade of the head, are found very injurious to hedges and pastures. The variety of this species, F pendula, was first discovered in a field at Gamblingay,

History, Use, Propagation, Culture,

in Cambridgeshire There are other varieties with curled leaves, striped leaves, variegated bark, &c and some consider F simplicifolia only a variety F Americana is a lofty tree, in few respects different from the common ash Those species which do not produce seeds are readily increased by grafting

Little is known of the qualities of the greater part of the numerous varieties of American ash, distinguished by Bosc They probably all form fine trees, the young plants in our gardens grow freely, and exhibit indications of valuable properties as ornamental trees.

2158 *Brosimum* From *βρωσιμος*, good to eat B Alicastrum is common in the woods of Jamaica. The timber is not despicable, but the leaves and younger branches are more useful, and a hearty fattening fodder for all sorts of cattle. The fruit, boiled with salt fish, pork, beef, or pickle, has been frequently the support of the negroes and poorer sort of white people in times of scarcity, and proved a wholesome, and not unpleasant food, when roasted, it eats something like our European chestnuts, and is called bread-nut. The leaves and younger shoots are full of gum, which renders them disagreeable to most cattle at first, but they soon grow very fond of them.

B spurium is also common in woods in the West Indies, but its timber is of little value In our stoves both species thrive well, and like loamy soil, and old cuttings, with their leaves on, root in sand in moist heat

2159. *Diospyros.* From *Διος πυρος*, the fruit of Jove, or heavenly fruit It has been fancied that the European species of this plant produced that famous fruit, which, according to ancient romancers, caused oblivion. D. Kaki is a valuable Japanese tree, which bears the fruit sometimes received from China in a dried form under the name of dates D discolor also bears a fine fruit. D lotus produces fruit the size of a

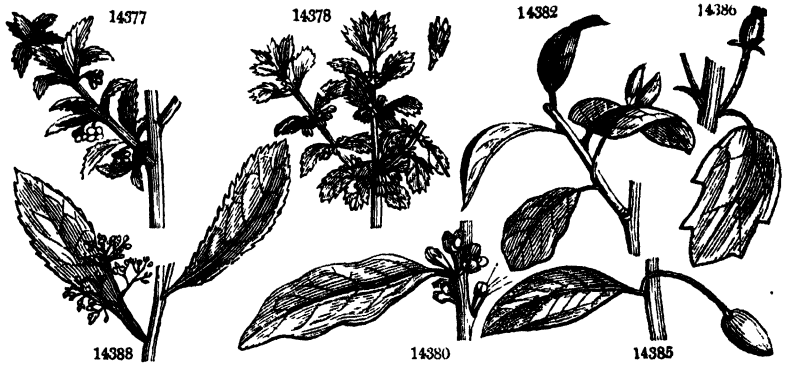
14376 Leaves obovate blunt smooth on each side

14377 Leaves obovate elliptical acute serrated at end, Pedunc umbelled axillary, Stamens exserted
14378 Leaves obovate retuse toothletted, Flowers axillary clustered, Stamens included
14379 Leaves ellipt Corymbs axillary aggregate



14380 Leaves oblong lanc subcoriaceous entire, Flowers axillary clustered

14381 Leaves oblong entire acute at each end, Petiole middle rib and edge villous, Female peduncles about 3-fl
14382 Leaves ovate-oblong entire acute at each end smooth, Female peduncles 2-flowered
14383 Leaves cordate ovate slightly serrated glaucous beneath, Flowers in globose heads, Drupes oblong
14384 Leaves on long stalks obl acuminate remotely serrate downy beneath, Female peduncles 1-flowered

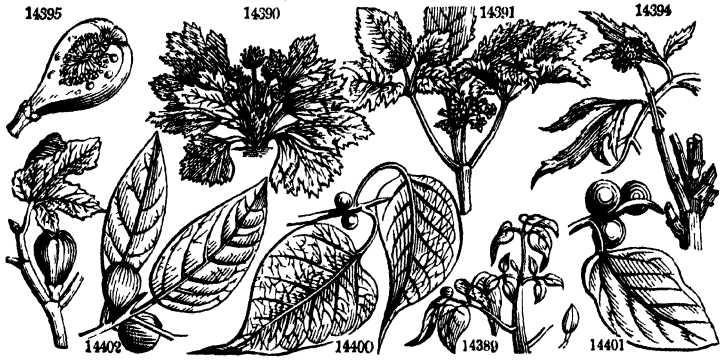
14385 Leaves on short stalks obl nearly entire cuneate at base whitish beneath, Female peduncle 1-fl
14386 Leaves on long stalks obl. acuminate remotely serrated smooth on both sides, Female peduncle 1-fl

14387 Leaves oval-oblong acuminate entire

14388 Leaves stalked oblong acute serrated coriaceous veiny smooth

and Miscellaneous Particulars

cherry, yellow when ripe, sweet, and somewhat astringent, they are recommended as a cure for the diarrhœa. D virginiana has a white brittle wood, covered with a dark brown bark. The fruit is in form and bigness like a date, very firm, like that fruit, and almost as sweet, with a large kernel.



2160 *Myrsine* A Greek word synonymous with Myrtle Modern botanists have applied the name to a genus of African myrtle-like shrubs The species grow freely in loam and peat, and are increased by young cuttings in sand under a hand-glass

2161 *Nyssa* A name of a nymph, according to Linnæus The species are large shrubs, which grow freely in any soil or situation, but prefer moisture. N denticulata grows naturally in wet swamps in Carolina and Florida, and rises there to the height of eighty or hundred feet. Marshall, in his American Grove, describes it as a tree of great singularity and beauty It produces fruit about the size and shape of small olives, which are preserved like them by the French inhabitants of the Mississipi, where it greatly abounds, and is called the olive-tree The timber is white and soft when unseasoned, but light and compact when dry, which renders it very proper for the carver and turner. All the species are readily propagated by layers or seeds.

2162. *Hamiltonia.* Dedicated by Muhlenburg, to Mr. Hamilton, an American botanist. A shrub growing to the height of from three to six feet The flowers grow in terminal racemes from an inch to an inch and a half long.

2163 *Laurophyllus* An hybrid name created by Thunberg, to express the resemblance of the leaves, φυλλα, to a laurel A shrub with stalked, oblong, acute, serrated, coriaceous leaves, and minute flowers growing in panicles three or four inches long.

History, Use, Propagation, Culture,

2164 *Bursera* So called after Joachim Burser, a disciple and friend of Caspar Bauhin, and professor of botany at Sara, in Naples He is said to have left behind him an Herbarium, in twenty-five volumes B gummifera is a large tree with a fine leafy head, and abounds in copious watery balsamic fluid, which soon becomes inspissated by exposure to the air The root is said to possess the same properties as Quassia. Hedges are made of it by the Spanish residents in South America, who call it *Almacigo*

2165. *Arctopus* Literally, bear's foot, ἄρκτος πους An inconspicuous prickly umbelliferous plant. The roots are used with success at the Cape, in cases of siphilis, but upon trial here some years since, they were found to be less efficient than Sarsaparilla

2166. *Panax* A high-sounding title, meaning little less than that the plant which bears it is the long sought *universal elixir*, the name has been taken from πανν, and ακος, a remedy, a remedy for all things. P. quinquefolium is a native of Chinese Tartary, and also of North America In the former country it has been gathered as an invaluable drug from time immemorial The roots, which are said to bear some resemblance to the human form, are gathered and dried, and enter into almost every medicine used by the Tartars and Chinese Osbeck says, that he never looked into the apothecaries' shops, but they were always selling Ginseng, that both poor people and those of the highest rank made use of it, and that they boil half an ounce in their

14436 Leaves oblong acuminate tapered at base, Branches pendulous

and Miscellaneous Particulars

tea or soup every morning, as a remedy for consumption and other diseases Jartoux relates, that the most eminent physicians of China have written volumes on the medicinal powers of this plant, asserting that it gives immediate relief in extreme fatigue, either of body or mind, that it dissolves pituitous humours, and renders respiration easy, strengthens the stomach, promotes appetite, stops vomiting, removes hysterical, hypochondriacal, and all nervous affections, giving a vigorous tone of body even in extreme old age The French in Canada use this root for curing the asthma, and as a stomachic After all, our physicians say, that we have no proofs of the efficacy of Ginseng in Europe, and that from its sensible qualities it seems to possess very little power as a medicine The hardy species thrive well in light rich soil, the others grow in loam and peat, and are increased by cuttings in sand under a hand-glass

2167. *Ficus* It is not known what the derivation of this word is; but in most languages it is nearly the same In Greek it is *συκη*, in Latin *Ficus*, in Celtic *Figuezen*, in Teutonic *feige*, in Sclavonic *jige*, in Hungarian *fuge*, in Anglo-Saxon *fic* The species are trees or shrubs, abounding in a milky juice. The fruit is turbinate, fleshy, soft, and hollow within. All the species are natives of warm countries F Carica, *le figuier*, Fr, *Feigenbaum*, Ger, and *Fico*, Ital, is supposed to be originally from Caria, in Asia, though it is now acclimatized, and in some respects naturalised in the Levant and

History, Use, Propagation, Culture,

the south of Europe. In these countries the fruit green and dried forms an important part of the food of the inhabitants In this country it is cultivated as a fruit tree, but not generally or extensively It is only in very warm situations that it will ripen its fruit in the open air, even though trained against a wall, though there are one or two exceptions in Sussex on the sea-coast, where it ripens its fruit on standards The only certain mode, however, is to grow it in houses built on purpose No tree is more robust or more prolific Even plants in pots or tubs kept in a temperature adapted for the orange-tree will fruit freely, and ripen two crops a year Kept in the temperature of the pine-apple, Mr Knight has proved, that the fig will go on growing and ripening fruit without intermission A variety of curious and important matter respecting this tree will be found in the Transactions of the Horticultural Society, and in the Encyclo-

Class XXIV. — CRYPTOGAMIA.

Sexual organs hidden, either imperfect, or not existing

This class differs essentially from all the preceding in the peculiar conformation of the organs of reproduction, which are not formed of male and female parts, like those of the higher classes of plants, but are of a nature altogether different, consisting either of buds under a particular form, or of vessels containing vegetable substances analogous to seeds, but differing in not being the result of impregnation, and in having the power of striking root indifferently from any point of their surface The internal composition of these vegetable substances, which are denominated sporules, is, on account of their extreme minuteness, unknown. Willdenow describes Cryptogamous plants to be vegetables *without any visible flower, and differing from other plants in* their external characters, in which respect they also differ from each other By more modern botanists they are said to be distinguished from other plants by the absence of lymphatic vessels, and of pores of the epidermis, but the latter character has been disputed, and neither apply to the three first orders of Cryptogamia For the purposes of this work, which follows the system of Linnæus, the definition, if it can be so called, of Willdenow is most applicable. In the arrangement of the orders of Cryptogamia, it has been found advisable to adhere to the divisions of modern writers, who, by extensive observations, and great powers of perception, have brought this most abstruse part of botany to a considerable degree of perfection.

The orders which are here adopted, are

I Filices. Reproductive organs uniform Thecæ naked, or covered by an involucre, placed on the back of a frond, which is either foliaceous, or contracted in such a way as only to cover the clusters of thecæ, and always circinate when young

II. Equisetaceæ. Reproductive organs uniform, in terminal spikes, composed of peltate, several-sided scales, producing on their under surface 4-7 elongated involucres containing the seeds. Branches whorled, rigid

III Lycopodineæ. Reproductive organs axillary, sometimes apparently spiked Thecæ? of two kinds, the one containing granules, the other larger bodies Stems covered with many small leaves.

IV Marsileaceæ. Reproductive organs radical, uniform Sporules? contained in roundish, one or many-celled indehiscent heads Plants simple, aquatic

V Musci Reproductive organs of two kinds Thecæ many-seeded, solitary, furnished with an operculum and columella Plants leafy

VI Hepaticæ. Reproductive organs of two kinds 1st Thecæ without an operculum, either naked or sessile, or furnished with a veil, through which they are, more or less, protruded. Sporules naked, or mixed with spiral threads 2d. Minute, roundish, or oblong bodies variously situated Plants frondose, of a cellular structure, not submersed

VII Algæ. Reproductive organs of two kinds 1st Thecæ or tubercles variously situated. 2d Sporules or granules naked, or immersed in the frond Plants always aquatic, and submersed

VIII Lichenes. Reproductive organs uniform Sporules deposited in receptacles of various forms, distinct in substance from the thallus, which is either pulverulent, crustaceous, membranous, foliaceous, or branched and shrub-like

IX. Fungi. Reproductive organs uniform Sporules arranged in tubular cells, placed in some part of the external surface Substance various, mostly thick and fleshy, sometimes vesicular Thallus none.

A few other divisions, such as Hypoxyla, &c., which have been proposed by some writers of authority, not having appeared to possess characters of sufficient importance, are here merged in others

In consequence of the wide difference which exists between the lower orders of vegetables and the higher, and the impossibility of subjecting the former to cultivation, it has been found requisite, with the exception

14437 Leaves oblong acute subcordate at base netted beneath
14438 Leaves ovate unequal-sided sinuate-toothed cordate at base rough on each side
14439 Leaves opp obovate oblong serrated acute scabrous above hairy beneath

14440 Leaves oblong acuminate blunt tapered at base netted beneath, Stipules scarious smooth
14441 Leaves ovate-oblong acute sinuate toothed smooth

and Miscellaneous Particulars

pædia of Gardening (§ 5268) F elastica as well as some other plants produce the gum known as India-rubber

F. indica is an immense tree, spreading very wide, the branches ash-colored, and throwing down roots into the soil Marsden mentions one of these growing near Memgee, twenty miles west of Patna, in Bengal, which was in diameter 370 feet, the circumference of the shadow at noon was 1116 feet, and there were fifty or sixty stems It is called the priest's tree, and held in so much veneration by the Gentoos, that if any one cuts or lops off a branch, he is looked upon with as great abhorrence as if he had broken a cow's leg F religiosa is so called, because it is sacred to the idol Vishnu The horizontal branches root into the soil like the other, all the species are of remarkably easy culture, and root easily from large cuttings.

---

of Filices and their nearest allies, to introduce some alterations into the form of the pages of this work These alterations commence with Musci

The orders of Cryptogamia being equal in importance to the classes of flowering plants, they will be treated of as the classes have hitherto been treated Each order will, therefore, stand by itself, and will have its genera and species arranged under it, without immediate connection with any other order.

Order 1.  FILICES.

Reproductive organs uniform Thecæ naked, or having an involucre placed on the back of a frond, which is either foliaceous, or contracted so as only to cover the clusters of thecæ, and always circinate when young

This is the most beautiful of all the orders of Cryptogamic plants, and has always been a favorite tribe, to which the most celebrated botanists of all modern times have given their attention Till some time, however, after the death of Linnæus, ferns shared the fate of all other departments of botany, being viewed rather as objects of elegant form than of scientific examination Sir James Edward Smith was the first author who attempted to distribute them into genera, by characters derived from a minute inspection of their organs of reproduction, and his arrangement, however imperfect it may now be considered, is certainly that upon the principles of which the more precise divisions of recent authors have been effected He was succeeded by Swartz, Willdenow, Brown, and many others, and lastly by Dr George Frederick Kaulfuss, Professor of Botany at Halle, whose arrangement of 1824 is chiefly here adopted as being the most recent which has been published

The principal distinction which exists between ferns and other orders of Cryptogamous plants is found in the situation of what are called their *sori*, or patches of reproductive organs, which are in all cases inserted upon the back surface of the leaf, or, as it is called in ferns, the frond, sometimes appearing only in the form of little spots, sometimes covering the whole of the under side of the frond, and sometimes contracting the substance of the frond, so as to give it the appearance of a single mass of fructification, bursting in a determinate manner, as in Ophioglossum, Schizæa, &c Besides this character, the fronds are always rolled up in a circinate manner when they are first developed.

That part of the frond which occupies the place of the petiole of a compound leaf is called the *rachis* The groups of thecæ forming the organs of reproduction are called *sori* (*a*), which are either naked or covered with an involucrum, or, as it is more frequently termed, *indusium*. (*b*) This latter organ, when present, either bursts outwardly towards the margin of the frond, or inwardly towards the midrib or rachis. It may also be either single or double, the latter term signifying, that there is a cover on each side the sorus. The bodies which are called *thecæ* by some authors, and capsules by others, are constructed in two ways; they are either surrounded

by an elastic furrowed ring, when they are called *Annulatæ* (*c*), or they are destitute of such a ring, in which case they are termed *Exannulatæ* (*d*) They contain the minute powdery matter, which is that by which ferns are reproduced, the constituent parts of this matter are called *sporules* (*e*), and are analogous to seeds in more perfect plants.

Tribe I. POLYPODIACEÆ.

Thecæ 1-celled, with an articulated, elastical, longitudinal ring, bursting across in an irregular manner.

2168 *Polybotrya* Thecæ closely covering the whole surface of the pinnules of an altered frond. Indusium none.
2169 *Acrostichum* Thecæ scattered, occupying all the lower surface of the frond, or a part of it. Indusium none
2170 *Hemionitis* Thecæ seated on the reticulated veins of the frond Indusium none
2171 *Gymnogramma* Thecæ seated on the forked veins of the frond Indusium none.
2172 *Meniscium* Sori linear, lunulate, somewhat parallel, placed across the spaces between the veins of the fronds Indusium none
2173 *Xiphopteris* Sori oblong, oblique, placed on the reflexed points of the frond. Indusium none.
2174 *Celerach* Sori linear, transverse, concealed under paleæ Indusium none
2175 *Polypodium* Sori in little round scattered convex spots Indusium none
2176. *Tænitis* Sorus linear, longitudinal, placed between the midrib and margin of the frond under the end. Indusium none
2177 *Nothochlæna* Sori almost marginal, continuous, covered by the scales, setæ, or hairs of the frond Indusium none
2178 *Onoclea* Sori globose, inserted upon columnar receptacles, inclosed within the berry-like pinnules. Indusium double common placed on the edge of the pinnule, and united into the form of a berry, proper membranous enwrapping the sori
2179 *Struthiopteris* Sori linear, crossing, inserted upon crested receptacles, included in a double row within the somewhat articulated pinnæ Indusium double common marginal opening inwards in a rugged manner, proper membranous, and resembling a partition
2180 *Allosorus* Sori placed on the transverse forked veins of spike-like pinnules, finally becoming confluent. Common indusium very narrow, arising from the revolute margin which is rolled inwards
2181 *Ellobocarpus* Thecæ globose, irregularly attached to the longitudinal veins of the frond Indusium transparent, discolored, arising from the revolute edge of the frond, continuous, and opening by a longitudinal suture
2182. *Lomaria* Sori linear, continuous, occupying the surface of the linear pinnæ of a particular frond Indusium marginal or submarginal, conniving, involute
2183 *Blechnum* Sori linear, continuous, (sometimes interrupted) contiguous to the midrib Indusium membranous, superficial, continuous, opening inwards
2184 *Woodwardia* Sori oblong, distinct, in rows, parallel, contiguous to the midrib Indusium membranous, superficial, vaulted, opening inwards
2185 *Doodia* Sori lunulate, distinct, parallel with the midrib Indusium membranous, superficial, flat, separating inwardly
2186. *Asplenium* Soli linear, placed upon lateral veins Indusium membranous, flat, separating inwardly
2187 *Allantodia* Sori oblong, oblique with respect to the midrib Indusium membranous, vaulted, cylindrical, adhering to a vein, opening inwards, finally spreading outwards.
2188 *Scolopendrium* Sori linear, oblique, opposite, double, parallel Indusia membranous, opening in opposite pairs
2189 *Diplazium* Sori linear, double alongside the veins Indusia double, narrow, placed between the sori, fixed lengthwise by the middle, with their exterior margin separate
2190 *Pteris* Sori continuous, linear, marginal Indusium from the inflexed edge of the frond, opening inwards

History, Use, Propagation, Culture,

2168 *Polybotrya* So called in allusion to the numerous bunches of the fertile divisions of its frond, from πολυς, many, and βοτρυς, a bunch Handsome species of West Indian and South American ferns. The genera of ferns are not very dissimilar in habit, so that it will be seldom that any remarks upon that subject will be found in these notes, which must necessarily consist chiefly of the etymology of the names The medical properties are probably the same in all the genera, such as appear of any consequence are, however, inserted in the proper places We will here take occasion to remark, that the cultivation of ferns is nearly the same in all cases, and that the soil best adapted for their growth is light peaty earth with a little loam They are propagated by division of the roots, or by seeds or sporules The latter plan has been practised at Liverpool,

2191. *Vittaria.* Sori solitary, continuous, linear, marginal or submarginal, immersed. Indusium double, superficial.
2192 *Lonchitis* Sori lunate, marginal, placed under the recesses of the frond. Indusium from the margin of the frond, inflexed, opening inwards.
2193 *Antrophyum* Sori linear, continuous, immersed in the reticulated veins of the frond Indusium double, opening in the middle
2194 *Adiantum* Sori inserted into the indusium, linear, contiguous, or roundish Indusium marginal, opening inwards, either nearly continuous, or squamiform, or reniform
2195 *Cheilanthes* Sori dot-like, separate, marginal in the recess of the indusium. Indusium either reflexed crenules of the frond, or squamiform, membranous, and arising from the margin, or nearly continuous, opening inwards.
2196 *Davallia* Sori roundish, nearly terminal and marginal, distinct Indusium superficial, attached inwards, and opening outwards
2197 *Dicksonia* Sori dot-like, marginal, solitary in the recesses of the frond Indusia membranous, nearly globose, marginal, adnate, opening unequally with lacerated orifices, and spreading back in all directions
2198 *Balantium.* Sori oblong-linear, nearly terminal and marginal, transverse Indusium coriaceous, reniform, 2-valved, opening outwards upper valve marginal, patera-shaped, lower nearly flat
2199 *Aspidium* Sori roundish, scattered Indusium solitary, orbicular, peltate, or reniform
2200 *Woodsia* Sori dot-like, scattered Indusium membranous, placed under the sori, somewhat patera-shaped and ciliated.
2201 *Cyathea* Sori globose, scattered, inserted upon an elevated receptacle, which arises from a division the vein Indusium spherical, opening in the middle, and finally becoming patera-shaped
2202 *Trichomanes* Sori marginal, inserted upon a long setaceous receptacle Indusium erect, campan
2203. *Hymenophyllum* Sori marginal, inserted upon a claviform receptacle Indusium erect, 2-valve

TRIBE II. OSMUNDACEÆ.

Thecæ without a ring, netted, pellucid, with radiating striæ upon their top, bursting lengthwise on one side

2204 *Todea* Sori oblong, seated upon forked veins of an unchanged frond Thecæ globose, stalked, netted, opening from their base as high as a pellucid dorsal projection Indusium none
2205 *Osmunda* Sori nearly globose, alternately arising from the margin of a frond, which becomes changed into a panicle Thecæ globose, stalked, netted, opening from their base as high as a pellucid dorsal projection Indusium none.
2206 *Lygodium* Thecæ oblong-ovate, striated at the end in a radiate manner, seated in two rows upon 1-sided marginal spikelets, fixed by their backs and opening lengthwise in front Indusium funnel-shaped, covering up each capsule
2207 *Anemia* Thecæ ovate, striated at the top in a radiated manner, disposed in compound unilateral spikes, attached by the base, and opening lengthwise. Indusium none

TRIBE III OPHIOGLOSSEÆ

Thecæ 1-celled, adnate at base, roundish, coriaceous, opaque, without a ring, not vascular, sometimes fastened together, half-bivalved.

2208 *Botrychium* Thecæ naked, globose, distinct, attached to the rachis of a compound spike, half 2-valved, opening nearly at one side
2209 *Ophioglossum* Thecæ naked, connate in a distichous jointed spike, half 2-valved, opening at the side
2210. *Marattia* Sori oval, somewhat marginal Thecæ united in a double row, opening inwards by a cleft. Indusium arched, opening lengthwise above, 2-valved, inclosing on each side a row of thecæ

by Mr H Shepherd, with so much success, that his method has been made the subject of a communication to the Horticultural Society, of which the following is an extract. "Having provided a common garden-pot four and a half inches in depth, and three and a half wide, let the bottom part, to the height of one inch, be filled with fragments of broken pots, by way of drain Over these should be spread a stratum of such soil as is commonly used for potting greenhouse plants, of the depth of two inches, the remaining inch and half should be filled with brown loamy earth sifted through a hair-sieve, the surface being made perfectly smooth, and on this the seeds are to be scattered as evenly as possible Care must be taken that the wind be not suffered to blow the seeds away, leaving nothing but empty capsules. The seeds being sown, no other covering is

History, Use, Propagation, Culture,

required than a bell-glass, which should just fit within the rim of the pot, so as to exclude all air The pot is then to be kept in a pan always half full of water, and set in a shady part of the stove or hot-house, being always regularly watered as above directed When the young plants have acquired their second leaf, it is proper to give them a little air, by placing a small piece of wood under the edge of the glass, at one side In a short time afterwards the glass may entirely be removed "

The vegetation of ferns appears to be less tardy than botanists have supposed Specimens of Gymnogramma tartareum having been brought from Jamaica to Liverpool, on the tenth of July 1817, a few seeds were brushed off them and sown immediately. Several plants thus obtained perfected seeds by the fifth of August 1818, which being committed to the earth, had produced young plants, covering the surface like a fine moss, by the eighth of September following Specimens of Pteris cretica, and another marked Pteris acrostichoides, from William Jackson Hooker, Esq , afforded seeds which have vegetated and produced very fine plants of both species Dr William Carey sent from Serampore specimens of Polypodium giganteum, and what appears to be a new Diplazium. These reached Liverpool, July the tenth 1818 , their seeds being immediately sown, had produced young plants by the eighth of September A small fern from Sicily, with several others of this tribe, collected in the Brazils by William Swainson, Jun , Esq , afforded ripe seeds, which being sown in the spring of 1818, had partly vegetated, and in September had produced Polypodum decumanum, as well as Gymnogramma calomelanos Mr Shepherd obtained two plants of the latter from seeds brushed from the specimens in the Herbarium of Dr John Reinhold Forster, now belonging to the botanic garden at Liverpool, and perhaps fifty years old. He made the experiments on other ferns in that collection, but without success, which, indeed, is not wonderful.

The seeds of this order of plants are of course liable to damage from damp or other accidents, like those of plants in general. It seems, moreover, that they are very soon shed by the bursting of their capsules, so that

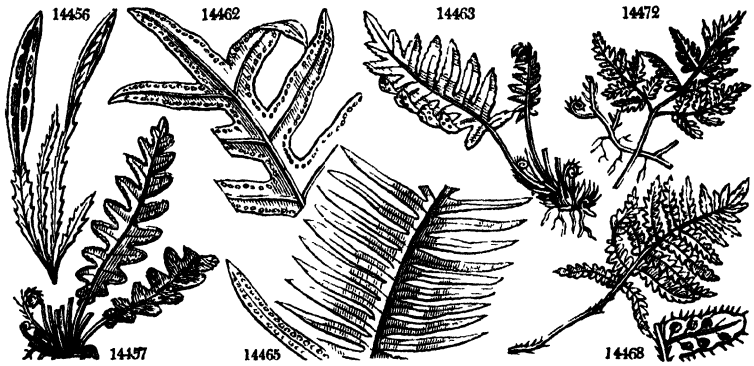
14451 Fronds pinnate pinnæ ternate in pairs and solitary stalked lin crenul , fertile yellow with meal beneath
14452 Fronds bipinnate : pinnulæ pinnatifid , segm. cuneate truncate at end toothletted yell with meal beneath
14453 Fronds bipinnate upper pinn confluent obl obt serrul , lower somew pinnatif white with meal beneath

14454 Fronds bipinnate pinn lanc. white with meal beneath , lower pinnatifid auricled at base, upper confluent



14455 Fronds pinn · pinn. lanc acuminate cuneate at base all repand lower opposite, Stem none

14456 Fronds linear toothed when fructifying entire at the end, Stem filiform ascending simple

14457 Fronds pinnatifid segm oblong obtuse chaffy with entire paleæ beneath

14458 Fronds hairy : sterile oblong ovate entire ; fertile lanceolate, Sori solit Stem filiform rooting chaffy
14459 Fronds lanceolate entire smooth, Sori solitary, Stem filiform creeping with bristly paleæ
14460 Fronds lanceolate margined acute tapered at base smooth, Sori in two rows
14461 Fronds oblong obtuse entire smooth above rusty with down beneath, Sori contiguous copious
14462 Fronds deeply pinnatifid glaucous segm lanc acuminate entire, Lower sori scattered , upper solitary
14463 Fronds deeply pinnatifid segm lin lanc blunt crenul contig upper smaller by degrees, Sori solitary

14464 Fronds deeply pinnatifid segm lanc blunt entire contig , upp smaller by degrees, Sori solit Stalk naked
14465 Fronds deeply pinnatifid segm lanc acute entire parallel smooth , upper and lower smallest, Sori solitary
14466 Fronds pinnatifid hairy segments half ovate blunt, Sori solitary
14467 Fronds deeply pinnatifid segm altern lin ent obt. , upper smaller by degrees ben. as well as stalk chaffy
14468 Fronds bipinnatif 2 lower pinnæ defl , segm lin-lanc blunt ent ciliat Veins hairy, Sori solit. marginal
14469 Fronds downy and ciliated bipinnatifid, Membranes connecting the opposite pinnæ oblong hexagonal
14470 Fronds 4-pinn Branches and branchlets lanc Pinnæ lanc pinnatifid, Segm ovate acute glaucous beneath
14471 Fronds 3-pinn pinnulæ pinnatif , segm lin serrat acute, Rachis edged naked, Sori solit Stalk smooth
14472 Fronds ternate bipinnate spreading deflexed segments blunt nearly entire, Sori marginal, Root filiform
14473 Fronds ternate bipinnate straight rigid segments bluntish nearly entire, Sori marginal confluent
14474 Fronds oblong smooth entire margined acute at each end, Sori in rows

and Miscellaneous Particulars

they are more likely to be found in such specimens as are just beginning to turn brown in their fructification, than in others more advanced

2169 *Acrostichum.* Said to be formed from the words ακρος στιχος, the commencement of a verse, and to have been so called because the reverse of their leaves indicates traces of lines, resembling the beginning of lines of poetry These are fine, chiefly tropical, ferns, one of which, A. aureum, sometimes grows to the height of five or six feet.

2170 *Hemionitis* Said by Dioscorides to be so called from the resemblance of its nature to that of a mule, ἡμιονος , it was always considered sterile, bearing neither flowers nor fruit.

2171 *Gymnogramma* Named by Desvaux from γυμνος, naked, and γραμμα, writing, in allusion to the disposition of the naked sori upon the forked veins of the frond, whence they seem to resemble Roman letters. The specie have been separated from Hemionitis and Acrostichum

2172 *Meniscium* From μηνη, the moon, the sori are crescent-shaped These ferns are remarkable for the arrangement of their veins The little veins which unite the transverse veins of the sterile frond are usually at right angles, and generally united with each other by a little branch which sets off from one or other of their angles In the fertile fronds the veins on which the sori are placed are either curved or straight

2173 *Xyphopteris.* Divided from Grammitis by Kaulfuss, who seems to have named it from ξιφος, a sword, and πτερις, a fern, on account of the sword-like form of their fronds

2174 *Ceterach* The name employed by the Arabian and Persian physicians for this plant was *Chetherak* (*Gazoph Ling Pers* p 577) They employed the plant in obstructions of the viscera, for the jaundice, and for disorders of the spleen

2175 *Polypodium.* From πολυς, many, and πους ποδος, a foot, on account of the multitude of the roots which form close entangled patches Many of the species of this genus are noble plants They are mostly epiphytic

History, Use, Propagation, Culture,

upon trees. Polypodium vulgare is sometimes burnt for the sake of its ashes, which contain a large proportion of carbonate of potash, which is employed in the fusion of flint for some kinds of glass-ware

2176 *Tænitis* From the resemblance of the interrupted line of sori to the *tænia* or tape-worm.

2177 *Nothochlæna* From νοθος, spurious, and χλαινα, a cloak So called because the sori are not enclosed in a genuine indusium, but are frequently covered over by the paleæ of the frond A genus extracted by Mr. Robert Brown from the ancient Acrostichum

2178 *Onoclea* A name given by Dioscorides, Pliny, and Galen, to a Boragineous plant, and strangely applied by the moderns to a genus of ferns O sensibilis has been so called from the delicacy of its frond, which is so impatient of injury as to perish with almost the least violence

2179 *Struthiopteris* Named from στρουθος, an ostrich, and πτερις, a fern, on account of the similarity between its fine fronds and the feathers of an ostrich A genus divided from Osmunda by Willdenow.

2180 *Allosorus* From αλλος, various, and *sorus*, a name contrived by Bernhardi, in a paper printed in Schrader's Journal, we presume in allusion to the different states of the sori at different periods A curious little rock plant.

2181. *Ellobocarpus* Named by Kaulfuss, from αλλοβος, enclosed in a pod, and καρπος, fruit, in allusion to the pod-like form of the divisions of the fronds on which the sori are placed.

14475 Fronds deeply pinnatifid glaucous: segments lanceolate acuminate repand serrate, Sori in rows
14476 Fronds pinnate, Leaflets lanceolate acuminate repand wavy distant
14477 Fronds lanceolate entire smooth or somewhat scaly rigid erect, Sori solitary
14478 Fronds simple 3-lobed and pinnatifid segments lanceolate acuminate opposite, Sori scattered immersed
14479 Sterile fronds sessile ovate sinuated: fertile pinnatifid, segments lanceolate
14480 Fronds on a creeping stem lanceolate acuminate entire sublucid with flexuous veins, Sori scattered
14481 Sterile fronds oblong entire fertile linear lanceolate repand, Sori solitary, Stem paleaceous rooting
14482 Fronds linear lanceolate much tapered at the base somewhat repand quite smooth, Sori scattered
14483 Ster. fronds obl. lanc. taper. at base fert. lin.-lanc bear sori on upp half, Sori oval immers. in dense wool
14484 Fronds pinnate, Pinn. somewhat stalked oblong acuminate coarsely and bluntly serrated, Sori in rows

14485 Fronds simple lanceolate acute at each end nearly entire fructifying at end

14486 Fronds bipinnate woolly pinnules elliptical obtuse covered all over with long wool

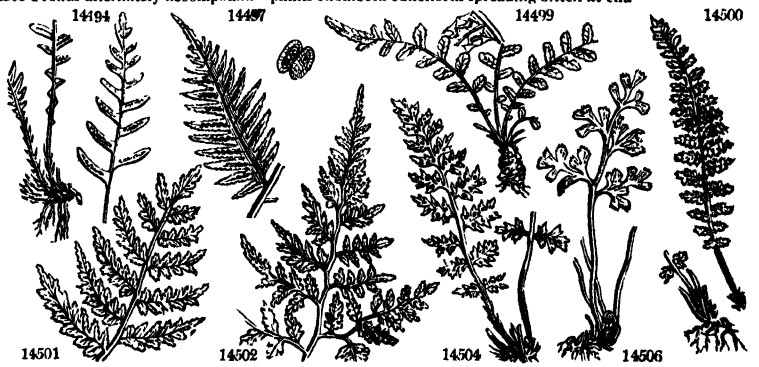
14487 Pinnæ lanceolate acute cut toothed pinnules and rachis smooth
14488 Pinnæ pinnatifid with rounded lobes pinnules villous, Rachis scaly

14489 Sterile fronds bipinnatifid: segments entire acute equal
14490 Sterile fronds bipinnatifid segments entire obtuse, lower long acute

14491 Fronds supradecompound, Pinnæ alternate roundish cut

14492 Alternate pinnæ pinnulate on the upper-side linear lower 2-parted

14493 Sterile pinnæ long-lanceolate acuminate cuneate at base repand-toothed fertile linear



14494 Fronds pinnated smooth, Pinnæ linear bluntish entire nearly equal at base
14495 Fronds pinnated, Pinnæ linear-lanceolate mucronate auricled at base scabrous at edge
14496 Fronds pinnated, Lower pinnæ opposite lanceolate entire subcordate at base, upper alternate united

14497 Fronds pinnate-pinnatifid segments lanceolate acuminate somewhat repand finely serrulate
14498 Fronds very smooth pinnate, Pinnæ sessile lanceolate pinnatifid, Segments oblong blunt crenulate

14499 Fronds lanceolate pinnatifid segm. linear ensiform acuminate spinulose, Sori lanceolate in two rows

14500 Fronds pinn. pinnæ cordate pinnatifid, segm. ovate rather acute, lower and terminal usually 3-lobed

14501 Fronds bipinn. pinnules obl. lanc. cut serrated serratures 2 or 3-toothed nearly acute, Sori obl. straight
14502 Fronds bipinn: pinnæ obl. lanc. acute, pinnules oblong pinnatifid cut, Sori becoming confluent
14503 Fronds bipinn. pinnules pinnatifid, segments 3 or 2-toothed
14504 Fronds bipinn. pinnules obovate blunt cuneate at base acutely toothed at end, Sori becoming confluent
14505 Fronds bipinn. pinnules oblong acute at each end serrated at end upper confluent
14506 Fronds alternately decompound pinnæ rhomboid cuneiform spreading bitten at end

and Miscellaneous Particulars.

2182 *Lomaria* From λωμα, an edge, on account of the marginal position of the indusia. These are fine plants, resembling Acrostichum in habit.

2183 *Blechnum.* One of the Greek names of the fern was βλιχνος. Athenæus writes it βλεχνος, and derives it from ϐλαξ, powerless, insipid

2184 *Woodwardia.* Named by Sir James Smith, after his friend Thomas Jenkinson Woodward, Esq., a good practical English botanist. One of the species produces little hairy bulbs at the axillæ of the leaves, which either fall off and strike root in the ground, or vegetate while attached to the parent plant. This property is common to many other ferns, and in one instance, the young plants so produced have been mistaken in Pteris cornuta for parasites by an acute cryptogamic botanist

2185. *Doodia.* So called in honor of Samuel Doody, a London apothecary, who was almost the first investigator of British cryptogamic plants. Small rough-leaved ferns of rigid texture.

2186. *Asplenium.* From α, privative, and σπλην, the spleen. This plant was formerly held to be a sovereign remedy for all diseases of this organ, and to be so powerful as even to destroy it if employed in excess.

History, Use, Propagation, Culture,

2187 *Allantodia* So named from ἀλλαντος, a sausage, or sort of small pudding, to which the cylindrical arched indusia bear considerable resemblance

2188. *Scolopendrium* On the lower surface of the fronds of this plant are to be seen little marks which bear a likeness to the insect called Scolopendra It is probable that the supposed varieties of this plant are distinct species One of them has been ascertained not to alter in being raised from seed.

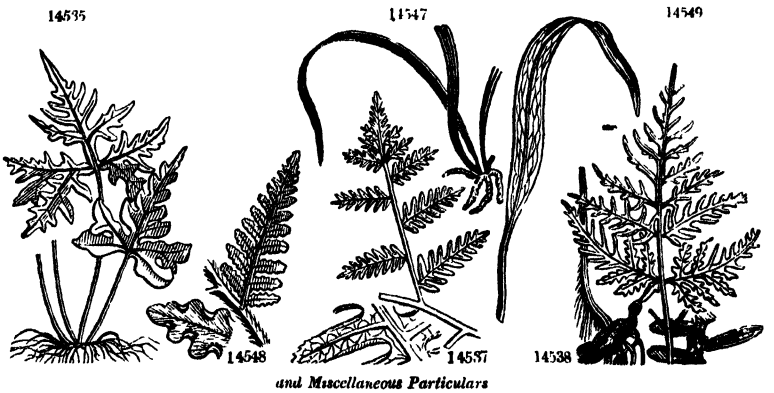
2189 *Diplazium* From διπλασις, double, the indusia are double Handsome ferns of large size; one forms a small tree.

2190. *Pteris* The Greeks called ferns in general by this name, because they generally resemble plumes, πτερὸν, in their light and divided appearance Pteris aquilina is the common brake, well known as an excellent covert for game, and for serving for many household purposes in the north of England. It is used as litter for

14507 Fronds pinnated: pinnæ cuneate ovate acute deeply pinnatifid, segments lanc cuneate unequally toothed
14508 Fronds pinnated: pinnæ stalked oblong acuminate pinnatif, segm. obl obt. sharply serrat. Sori parallel
14509 Fronds pinnated: pinnæ ovate repand somew auricled, term. remote small entire, Fronds rooting at end
14510 Fronds pinnated. pinnæ alternate elliptical roundish crenate, Rachis flattened beneath
14511 Fronds pinnated: pinnæ roundish blunt crenated cuneate at base, Stalk discolored
14512 Fronds pinnated. pinnæ ovate-roundish crenate, Rachis shining keeled beneath
14513 Fronds pinnated: pinnæ alternate cuneiform erect eroded at end
14514 Fronds pinnated: pinnæ sessile lanceolate serrulate cordate at base auricled upwards
14515 Fronds pinnated: pinnæ lanceolate blunt equally and bluntly serrated, Sorus one on each pinna
14516 Fronds broad-lanceolate subsessile, Sori very near parallel contiguous to the midrib
14517 Fronds pinnated. pinnæ ovate oblique serrated obtuse unequal at base cuneate
14518 Fronds pinnat. pinnæ altern, upp usually opp lin-lanc. subrepand truncat. at base above rounded below
14519 Fronds pinnated trifid: pinnæ alternate linear torn at end
14520 Fronds lanceol stalked rather crenate auricled cordate at base at the end very long linear-filiform rooting
14521 Fronds lanceolate on short stalks acuminate serrated tapered at base and entire, Sori contiguous parallel
14522 Fronds pinnate pinnæ lanceolate taper-pointed at end pinnatifid, segments bind, Stalk shining glabrous
14523 Fronds ternate middle leaflet pinnatifid, lateral 2-parted toothed
14524 Fronds pinnated pinnæ obl lanceolate acuminate coriaceous serrated at end tapered at base, Stalk chaffy
14525 Fronds 3 pinnated pinnæ oblong lanceolate with very long points, Sori becoming confluent
14526 Frond 5-lobed cordate, Three middle lobes acuminate

14527 Fronds bipinnate pinnules oblong pinnatifid, segments lanceolate finely bidentate, Sorus schit. at base
14528 Fronds 3-pinnate. pinnules lanceolate decurrent cut serrated, Sori contiguous finally becoming confluent

14529 Frond simple cordate-lingulate smooth beneath



14530 Fronds pinnat pinnæ lanc serrat at end truncate at base above rounded and somew wedge-shaped below
14531 Fronds pinnat pinnæ lanc coarsely toothed, teeth rounded serrated at end tapered and finely toothed

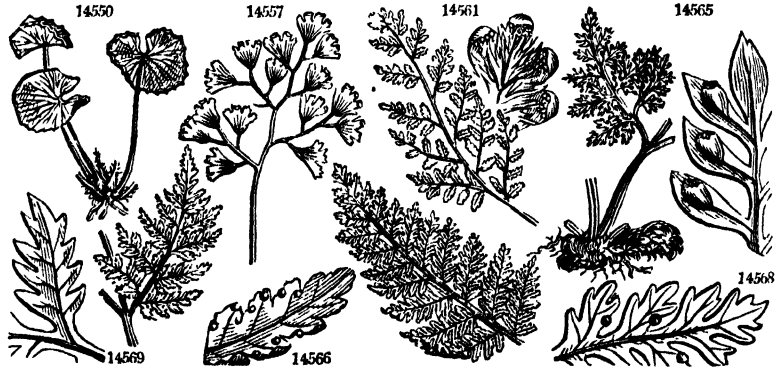
14532 Fronds pinnated: pinnæ linear auricled cordate at base serrulate, Stalk and rachis paleaceous hairy
14533 Fronds pinnated pinnæ oblong lanceol on short stalks entire cuneate at base, Stalk and rachis smooth
14534 Fronds pinnated pinnæ lin decurrent, lower 3-parted, Sterile acutely serrated fertile ent serrul at end
14535 Fronds decompound lower bipinnate, pinnules lanceol retuse at base, terminal longer, Stalk pubescent
14536 Fronds bipinnatifid, Lower branches twin 2-partite below, Pinnules lanceolate subfalcate sharply serrated
14537 Fronds supradecompound pinnæ broad-lanceolate pinnatifid, Stem and branches prickly
14538 Fronds tripinnate pinnules linear decurrent downy beneath, those at the end longest, Rachis smooth
14539 Frond 3-parted, Branches bipinnate, Pinnules linear elongated blunt entire lower bipinnatifid
14540 Frond 3-parted, Branches bipinn Pinnules lin lanc upper undivided, lower pinnatif Segm obl blunt
14541 Frond pedate, Branches pinnate, Pinnules obl lanceolate acumin pinnatifid, Segm oblong acute serrated
14542 Fronds pinnat pinnæ lanc acum on short stalks tapered and serrated at base, lowest 2-parted or ternate
14543 Fronds bipinn pinnules somew stalked ovate-lanc blunt crenulate, lower hastate 3-lobed, Stalk smooth
14544 Fronds deeply 5-lobed palmate, Lobes pinnatifid segments linear lanceolate acumin Recesses rounded
14545 Fronds deeply 5-lobed palmate, Lobes pinnatifid segments linear lanceolate acute, Recesses acute
14546 Pinnæ opposite pinnatifid, Nerve above a little strigose, Pinnules lanceolate blunt entire, Petiole smooth

14547 Fronds linear very long pendulous, Sori solitary within the margin

14548 Fronds bipinnate hairy pinnæ pinnatifid acuminate, segments blunt, Stalk and rachis villous

14549 Fronds linear-lanceolate tapered at each end ribbed, Sori reticulated

and Miscellaneous Particulars



cattle, and very frequently for the purpose of thatching cottages The ashes are employed in the manufactory of soap and glass Its astringent quality has recommended it in dressing and preparing kid or chamois leather. The country people take it medicinally to destroy worms, and a bed made of the green plant is esteemed a sovereign cure for the rickets in children

2191. *Vittaria* From *vitta*, a ribband, on account of the narrow ribband-like appearance of the fronds Small simple-leaved grass-like plants, of difficult cultivation

2192 *Lonchitis.* From λογχη, a lance, on account of the form of the fronds of some species The Greeks had a plant named λογχιτις, but it must have been very different from that of the moderns.

2193. *Antrophyum* A genus divided by Kaulfuss from Hemionitis, and named from αντρος, a cavern, and φυω, to grow, in reference to its native places of habitation

History, Use, Propagation, Culture,

2194. *Adiantum* From ἀδιαντος, dry In vain you plunge the Adiantum in water, says Pliny, it always remains dry. The prettiest of all ferns, on account of the delicate slender stalks on which the pinnules are balanced in the air; one species on this account is called Capillus Veneris, or in English, Maiden's Hair

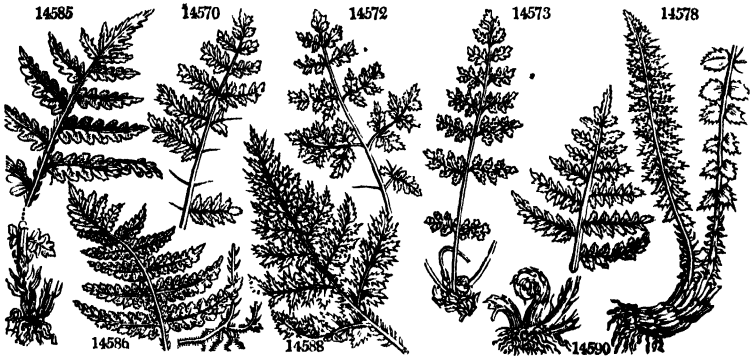
2195 *Cheilanthes* From χειλος, a lip, and ανθος, a flower, in allusion to the lip-like form of the indusium Pretty plants, formerly referred to Pteris.

2196 *Davallia* Named by Sir James Smith, after his friend M Davall, a Swiss botanist, who sent him large collections of plants. D canariensis is popularly called the hare's-foot fern, on account of the peculiar form of its rootstock, which curves over the side of the pot in which it grows, and, being covered with close brown hairs, resembles very perfectly the foot of a hare.

2197 *Dicksonia* In honor of the late Mr James Dickson, a celebrated British cryptogamic botanist. A noble genus containing several arborescent species, among which the tree-fern of St. Helena is placed This plant is often brought in a living state to this country, but the mode of cultivating it being unknown, it rarely survives more than a few months

2198. *Balantium* A genus of Madeira ferns, divided from Dicksonia by Kaulfuss, on account of its transverse two-valved indusium, and named from βαλαντιον, a purse, on account of the form of the indusium.

14550 Fronds simple reniform-orbicular crenate, Both diameters equal
14551 Frond digitate, Branches pinnate, Pinnæ linear-oblong obtuse nearly halved crenate, Stalk smooth
14552 Fronds pinnate · pinnæ ovate acuminate cuneate at base toothed at end, Sori continuous upon each edge
14553 Frond pedate, Leaflets pinnate, Pinnæ rhomboid-oblong somewhat lunate cut-lobed
14554 Fronds bipinnate · pinnules trapezoid-obl blunt, Sori oblong at the end of the upper edge, Stalk villous
14555 Fronds bipinnate · pinnules rhomboid oval serrated at end, Sorus lin solitary on upper edge, Stalk hairy
14556 Fronds supradecomp pinnules trapezoid acum cut crenate towards end of upper edge, Sori on crenatures
14557 Frond alternately decompound pinnules stalked cuneiform lobed
14558 Fronds supradecompound: pinnules rhomboid blunt cut lobed on upper edge, Lobes toothl. bearing sori
14559 Fronds pinn or bipinn. pinnæ obl lanc. halved truncate at base serrul. Sori on upper edge, Stalk smooth



14560 Fronds bipinnate, Lower pinnæ bipinnate · pinnules ovate-ellipt obtuse obsoletely subcordate crenulate
14561 Fronds bipinn hairy on each side pinnules pinnatif, segments obl blunt entire, Stalk and rachis hairy
14562 Fronds bipinnate smooth pinnules obl lanc. obtuse pinnatifid cut, segments subbifid, Stalk paleaceous
14563 Fronds tripinnate somewhat villous, Leaflets orbicular very small

14564 Fronds bipinnate alternate, Leaflets lanceolate pinnatifid, Sori linear oblong
14565 Fronds 3-parted alternately decompound segments lanceolate, those bearing sori obovate

14566 Fronds supradecompound villous, Leaflets nearly entire, Stem arboreous
14567 Fronds tripinnate pinnæ tapered, pinnules oblong blunt pinnatifid, Segments blunt toothed
14568 Fronds bipinnate: pinnæ pinnatifid, segments toothed, Rachis somewhat hairy

14569 Fronds tripinnate smooth pinnules ovate oblong cuneate cut-toothed

14570 Fronds pinnate pinnæ ovate-oblong pinnatifid, segments oblong blunt toothletted
14571 Fronds pinnate remotish · pinnules oblong serrated bulb-bearing beneath, lower pinnatifid
14572 Fronds bipinnate pinnules oblong blunt cut-serrated, Serratures blunt toothletted, Rachis winged
14573 Fronds bipinn · pinnules ov obl lobed pinnatif, segm linear-oblong blunt nearly entire, Rachis winged
14574 Fronds bipinn pinnules lanceolate acuminate pinnatifid, segments linear acute serrated, Rachis winged
14575 Frond lanceolate pinnate pinnæ deeply pinnatifid cut toothed, Rachis quadrangular, Sori lateral
14576 Fronds tripinnate pinnules pinnatifid, segments linear toothed at end
14577 Fronds simple cordate 3-lobed or ternate middle larger, lat ral auricled at base
14578 Fronds pinnate pinnæ ciliate serrate, Stalk strigose
14579 Fronds pinnate pinnæ falcate lanceolate serrate truncate at base auricled above [marginal
14580 Fronds pinn pinnæ lanc. subfalcate cordate at base gibb and somew serrul. on upper edge, Sori solitary
14581 Fronds pinnate pinnæ ensiform serrated, Serratures half ovate ovate nerved
14582 Fronds pinn pinnæ ensiform attenuated at end downy ben cut pinnatif Sori almost marginal contiguous
14583 Fronds pinn pinnæ pinnatif, segm lanc ac Lowest of last pinnæ longest pinnatif cut, Veins hairy ben
14584 Pinnæ pinnatifid somewhat linear pinnules oblong nearly entire, Sori in rows near the edge of pinnæ
14585 Fronds pinnate pinnæ lanceolate glabrous resinous glandulose beneath pinnatifid, the segm lanceolate obtuse entire, lowermost ones longer, Sori marginal
14586 Fronds pinn pinnæ lin-lanc pinnatif glab segm ov ac ent Sori marginal contigu at length confluent
14587 Fronds pinnate pinnæ subcordate oblong pinnatifid, segments oblong obtuse dentato-serr Stalk chaffy
14588 Fronds bipinnate pinnules rigid ovate sublunate acum aristate oblique and cuneate at base and decurr, the margins faintly serrated spinulose with a tooth near the base on upper side, Stalk and rachis chaffy
14589 Fronds bipinnate pinnules oblong obtuse decurrent crenate Crenatures at base deepest, Sori marginal
14590 Fronds bipinn · pinnules obl obt serrat mutic Sori near the central nerve, Stalk and rachis chaffy
14591 Fronds bipinnate pinnules scarcely rigid ovate rather obt aristate truncate at base which has a lobe on the upper margin shortly petiolate, the margin deeply serrated and spinulose, Stalk and rachis chaffy

and Miscellaneous Particulars.

2199 *Aspidium* From *ασπις*, a little buckler, on account of the form of the indusia *Fougère*, Fr, *Johannis wurtzel*, Ger, *Felì Maschia*, Ital, and *Polypodio Helecho Masculino*, Span The male fern is common to Europe, in shady places and woods The root consists of many matted fibres, forming a turfy or cæspitose head, of the thickness of the finger, blackish and scaly. It has been celebrated from time immemorial as a specific for worms It appears to have been used as such by Theophrastus, Dioscorides, and Galen, but seems to have been neglected by the moderns, with the exception of empiric practitioners, until the publication of Madame Nufer's specific for the tape-worm by the French government again brought it into notice According to her plan of administering it, from one to three drachms of the powdered root were directed to be taken in a large cupful of water in the morning, while the patient was in bed, and two hours afterwards, a strong cathartic of calomel and gamboge, proportioned to the age and strength of the patient, was given, and if necessary, the further operation was promoted by a dose of purging salts, nothing but broth being taken till the worms came away If this, however, did not happen on the same day, the process was ordered to be repeated on the next day. In the present state of medical science, oil of turpentine is considered a certain specific for expelling tæniæ. (*Thom Lond Disp.* 186)

Aspidum Baromez is the famous Scythian lamb, of which so many fables have been related Although it

History, Use, Propagation, Culture,

is often brought in a fresh state to the markets of Macao, as an article of medicine, no plants have ever reached this country alive Its name has arisen from the resemblance which its brown hairy rootstalk bears to a little rufous dog couching, and the belief in its animal nature has been confirmed by the color of the juice, which is of a rich blood color, and soon becoming thick by exposure to the air It is needless to add, that the stories about no plant being able to grow near it are mere fables Kæmpfer says, that *boranetz* is the name which the people on the borders of the Caspian Sea give to a kind of sheep of that country

2200. *Woodsia* Small ferns formerly referred to Polypodium, Aspidium, and Nephrodium, by various writers, and distinguished from all these by Mr. Brown, who named the genus after Mr Joseph Woods, an ingenious British botanist

2201 *Cyathea* From κυαθος, a cup, on account of the cup-shaped form of the indusia A fine tropical genus of ferns, which does not appear to have been well understood by its author, who confounds it with little British plants referred by all other botanists to Aspidium Nearly all the species are arborescent, and arrive at the greatest height of which ferns are susceptible. C glauca forms a lofty tree in the Island of Bourbon, and C speciosa and excelsa are not less than twenty-four feet in height

2202 *Trichomanes* From θριξ τριχος, hair, and μανια, excess The Greeks gave this name to the plant now called Asplenium trichomanoides, on account of its fine shining stems, which resemble hairs. Elegant plants with almost transparent foliage.

14592 Frond somew bipinn. pinnules decurrent ellipt pinnatifid serrul. spiny, Rachis smooth, Nerves flexuose
14593 Fronds bipinnate pinnules oblong distinct inciso-pinnatifid, segments mucronato-serrate, Stalk chaffy
14594 Fronds bipinnate: pinnæ pinnated bipinnatifid below; pinnules lanc blunt, Segments ovate toothletted
14595 Fronds 3-pinnate pinnules oblong blunt hairy above, toothed, Stalk and rachis bristly chaffy
14596 Fronds pinnate pinnæ lanc hairy on each side pinnatifid, segm oblong blunt entire, lowest nearly equal
14597 Fronds pinn. pinnæ altern subsess subserr ciliat auric. at base on upp edge, Upp pinnæ bear sori, Stalk
14598 Fronds bipinnate pinnules lin pinnatifid cut, segm mucronate serrate at end, Stalk chaffy [chaffy
14599 Fronds bipinn. pinnules lin lanc. cut serr Serrat 2 or 3 toothed. those at end most ac Sori obl lunate

14600 Frond lanceolate pinnate pinnæ cordate pinnatifid hairy on each side, Lobes rounded repand
14601 Fronds bipinnatifid: pinnæ oblong blunt, lower repand, upper entire

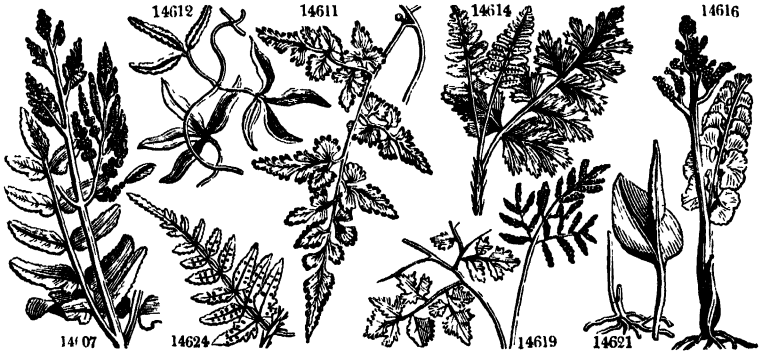
14602 Fronds bipinnate: pinnules lanceolate serrate sharpish, upper confluent, Stalk smooth, Stem arboreous

14603 Frond tripinnatifid lobed smooth. segments linear entire, Stalk winged, Columella included

14604 Frond alternately bipinnatifid segments and invol serrated, Sori solitary axillary

OSMUNDACEÆ.

14605 The only species



14606 Fronds pinnat ster bipinnatif, segm ov obl obt entire, Stalk woolly, Fertile fronds bipinnate woolly
14607 Frond bipinnate bearing the spike at end pinnules cordate-lanceolate smooth
14608 Fronds bipinnatifid rusty with down contracted and fertile at the end
14609 Fronds bipinnatifid entire smooth interrupted in the middle by 3 pair of fertile pinnated racemes
14610 Fronds bipinn pinnules lanc. sharply serrat cune at base, all altern A tert bipinn panic at end of frond

14611 Stem flexuose round, Fronds conjugate pinnate, Leaflets bearing spikes on each edge
14612 Stem flexuose climbing, Fronds conjugate 3-4-lobed palmate, Lobes lanceolate acute entire
14613 Stem flexuose climbing, Fronds conjugate cord 5-lobed palmate, Lobes lanc. ent obt obscurely sinuated

14614 Frond bipinnatifid hirsute segments cuneate lined blunt and serrated at end
14615 Frond 3-pinnatifid triangular segm ovate acute toothletted at end, beneath and the rachis downy

OPHIOGLOSSEÆ.

14616 Scape with a simple frond above, Frond pinnate pinnæ lunate entire
14617 Scape none, Fronds radical 3-parted bipinnate pinnules lunate crenate
14618 Scape with a simple frond at bottom, Frond 3-parted bipinnatifid segm linear 2-parted 2-toothed at end
14619 Scape frondose in midd Frond subtern 3-parted bipinnatifid, Leaflets cut pinnatif Segm obtuse 3-toothed
14620 Scape with a simple frond at bottom, Frond mostly bitern Leaflets obl lanc serrul. unequally cord at base

and Miscellaneous Particulars

2203 *Hymenophyllum* From ὑμην, a membrane, and φυλλον, a leaf, in allusion to the tenuity of the foliage. This and the last are the most elegant of all ferns, they generally grow in damp shady places among moss, and have hitherto refused cultivation under any plan which has been devised

2204 *Todea* Named after Tode, an experienced mycologist, author of Fungi Mecklenburgensis Mr. Brown unites this genus to Osmunda, but Kaulfuss keeps them distinct.

2205 *Osmunda* A word said to be of northern origin, and to have received its name on account of its potential qualities in medicine Osmunder was one of the names of Thor, a Celtic divinity, and *mund*, in Anglo-Saxon, is expressive of force or power These are noble species of hardy ferns. O regalis is the finest of all our native species

2206. *Lygodium.* From λυγος, a band The species are elegant twining plants, which bind together the grass or small shrubs near which they chance to grow L. palmatum, although a North American plant, must have the protection of a good frame

2207 *Anemia* From ανεμων, naked, in allusion to the naked spikes of inflorescence; whence some authors write the word Aneimia

2208. *Botrychium.* Derived from βοτρυς, a bunch, on account of the bunch-like form of its fructification Botrychium virginicum is the largest of the American kinds, and is called the rattle-snake fern, from the circumstance of its generally growing where these venomous reptiles are usually found.

2209. OPHIOGLOSSUM *L*	Adder's-tongue			*Sp* 3—9

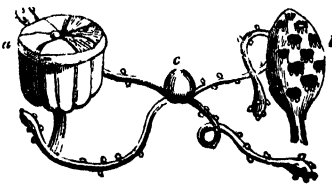
History, Use, Propagation, Culture,



2209 *Ophioglossum* From ὄφις, a serpent, and γλῶσσα, a tongue The little green narrow-pointed leaves, seated on a narrow stalk or neck, and peeping up from among the grass, may be not unaptly compared to a snake's tongue

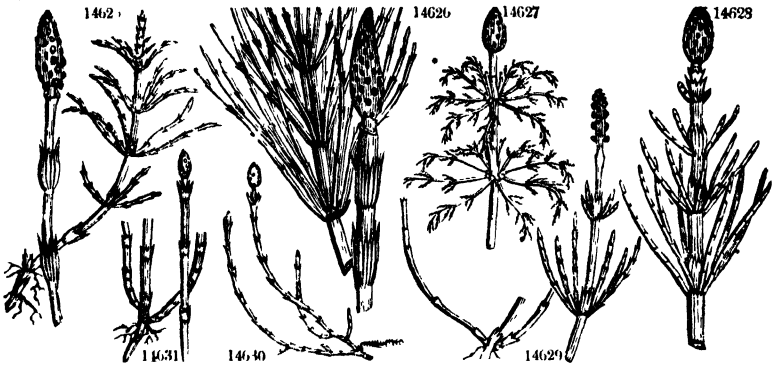
14621 Frond ovate veinless
14622 Spike cauline, Frond cordate acute reticulated
14623 Spike cauline, Frond subcordate ovate obtuse, Root bulbous

14624 Fronds bipinnate: pinnules acutely serrate, Rachis scaly. partial winged

and Miscellaneous Particulars.

2210 *Marattia* in honor of J. F Maratti, a writer upon ferns. He lived at Vallombrosa, in Tuscany. Kaulfuss considers this, Danæa, and Angiopteris as constituting a particular tribe, which he calls Marattiaceæ, but of which he has not given the characters.

Order 2. EQUISETACEÆ.



Reproductive organs uniform, in terminal spikes, composed of peltate, several-sided scales, producing on their under surface 4-7-elongated involucres containing the seeds Branches whorled, rigid

This order contains one genus only, which is among the most puzzling of all the anomalous formations which are so frequently met with among the lower orders of vegetation Both the stems and branches are regularly articulated, and arise from a tubular sheath There are no leaves, and the reproductive organs are arranged in a terminal spike (*b*), on all sides of which are inserted many peltate scales (*a*) with several sides or angles Several wedge-shaped hollow bodies project from the surface of these scales, and bursting inwardly, discharge their contents, which are not yet well understood. They consist of a number of green roundish bodies, surrounded by minute granules, and furnished at the base with four elastic filaments (*c*), thickened at their apex. By some observers the granules have been considered pollen, the filaments stamens, and the green bodies ovaries, by others the granules have been called naked seeds, by Kaulfuss the wedge-shaped hollow bodies are considered capsules, and the green bodies, seeds It is probable that none of these theories are true.

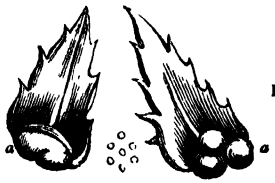
History, Use, Propagation, Culture,



2211 *Equisetum* Literally, horse-hair, from *equus*, a horse, and *seta*, hair, so called, in allusion to the fine branches of all the species The first five species are noxious weeds on deep loamy soil, especially such as has been gained from rivers or lakes E. fluviatile rises three or four feet high, the thickness of a finger, with numerous branchlets or leaves proceeding from the whorls, according to Haller, this species was eaten by the common people among the Romans. Linnæus affirms, that rein-deer, who refuse hay, will, however, eat this,

14625 Ster stems decumb with simp branches, which are rough tetragon. fertile ones erect simp their sheaths cylind incise-dentate
14626 Sterile stems with very numerous simple branches, which are roughish octagonal fertile ones simple, the sheaths infundibuliform lacinato dentate, their teeth setaceous
14627 Sterile and fertile stems with their branches comp roughish deflexed 4-sided, Branchlets subtriquetrous
14628 Stems branch upw with branches about 12 in a whorl simple pentagon smooth, Spike or catkin terminal
14629 Stems branched glabrous sulcate, Branches simple pentagonal, Spike terminal
14630 Stems naked very rough branched at base, Sheaths black with white membran lanc teeth, Spike terminal
14631 Stems simple erect very rough bearing spikes at the extremity, Sheaths whitish black at base and summits, Teeth aristate deciduous

and Miscellaneous Particulars

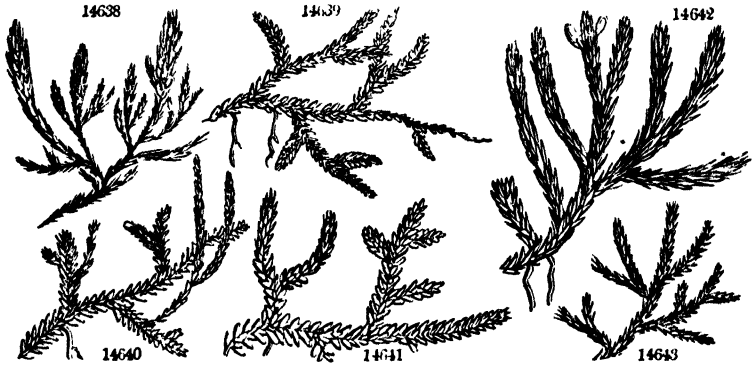
that it is cut as fodder for kine, but that it is not so acceptable to horses E hyemale is the best species for polishing wood and metal, and is imported from Holland for that purpose under the name of Dutch rushes. It is much used by whitesmiths, cabinet-makers, and comb-makers, and formerly it was in demand for scouring pewter and wooden things in the kitchen.

Order 3.  LYCOPODINEÆ.

Reproductive organs axillary, sometimes apparently spiked Thecæ? of two kinds, the one containing minute granules, the other larger bodies Stems covered with many small leaves

The reproductive organs of these plants are always axillary, the apparently spiked arrangement which they occasionally present being caused by the partial abortion of the leaves, at the base of which they are seated The thecæ (*a*)? the nature of which is very doubtful, and which have accordingly been called by different writers *capsulæ*, *conceptacula*, and *cocci*, are formed of from one to three valves, and of a similar number of cells, and contain either a mass of minute powdery granules, or some corpuscles of a larger size The nature and properties of both these are uncertain Decandolle imagines that one may be the means of fertilizing the other

2210. *Lycopodium.* Thecæ reniform, 1-celled, 2-valved, with many sporules Sporules very minute, powdery



2211. *Psilotum.* Thecæ 3-coccous, 3-celled, cells opening upwards, half 2-valved.

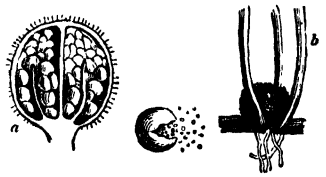
History, Use, Propagation, Culture,

2212 *Lycopodium* From λυκος, a wolf, and πους, a foot, on account, as Dalechamp assures us, of the resemblance the roots bear to a wolf's foot Selago is an ancient word applied to some succulent plant, and derived, according to De Theis, from the Celtic *sel*, sight, and *jach*, salutary, as being useful for complaints in the eyes. From the same root *sel*, was formed *selma*, the name of Fingal's hall, which in modern language would be called *Belle-vue*. The species are neat little evergreen moss-like herbaceous plants, some of which are found in all parts of the world L helveticum is a pretty prostrate plant, with small bright green leaves, for the beauty of which it is often cultivated in hothouses on the edge of the aquarium, or in pots set in pans of water. L. Phlegmaria is a fine species found in various parts of the East Indies, but hitherto a stranger to our gardens. It is a parasite upon the trunks of trees, whence it hangs down in tufts from six inches to a

14632 Stem creeping, Branches ascending, Leaves scattered incurved and hair-pointed, Spikes geminate cylindrical pedunculate their scales ovate acuminate eroso-dentate
14633 Stem erect, Branches altern dichotom Leaves bifarious connate spreading at end, Spikes 4 round cylind
14634 Stems prostrate, Branches dichotomous and fasciculated, Leaves quadrifarious oblong convex acute appressed, Spikes terminal solitary sessile short cylindrical
14635 Stem erect, Branches alternate compact dichotomous spreading, Spikes solitary terminal sessile
14636 Stem creeping, Branches ascending dichotomously branched, Branchlets simple, Leaves in 5 rows linear lanceolate mucronate serrulate patent, Spikes oblongo-cylindrical solitary sessile terminal
14637 Stem creeping, Branches simple solitary erect with a single sessile leafy spike at its extremity, Leaves linear scattered acute entire curved upwards
14638 Stem creep Branches ascend simple, Lvs scattered lanc subpatent ciliato-denticul Spikes term solitary
14639 Leaves bifarious spreading ovate acute of the surface distichous ciliated flat, Spikes roundish sessile
14640 Lvs bifar ½-cord blunt of surface altern distichous ovate-obl blunt, Spikes stalked term mostly in pairs
14641 Lvs bifarious ovate s- bicord acute toothletted of surface altern ovate acute, Spikes terminal short sessile
14642 Stems dichotomously branched erect fastigiate, Leaves scattered in 8 rows linear-lanceolate acuminate entire imbricated rigid, Capsules scattered not spiked
14643 Stem creeping branched, Leaves scatt imbric ciliated with a hair at end, Spikes solitary sessile terminal
14644 Leaves in 8 rows linear-lanceolate toothletted acute spreading reflexed, Stem ascending bind
14645 Lvs bifarious roundish ovate acute flat toothl Stem branched rooting at base, Spikes term sess subsolit.
14646 Branches nearly simple long ascend with one spike at top, Lvs lin.-subul toothed at base, Spike sess leafy



14647 Stem dichotomous, Branches 3-cornered

and Miscellaneous Particulars.

foot in length L. Selago is used in Skye, and some other places, to fix colours in dying, instead of alum. The Highlanders employ it in infusion as an emetic and cathartic, but it operates violently, and, unless taken in a small dose, brings on giddiness and convulsions Linnæus says, the Swedes use a decoction of it to destroy lice on swine and other animals All the species may be cultivated in a light peaty soil, but they require an abundance of moisture.

2213. *Psilotum* From ψιλος, naked This is a little bushy evergreen herbaceous plant of no beauty Its branches are 3-cornered, and altogether destitute of leaves The theca appear from the little indentations of the branches, and are of a whitish-yellow color. It is easily cultivated in a little peat and sand, but it has no ment except as an object of curiosity.

Order 4. MARSILEACEÆ

Reproductive organs radical, uniform. Sporules contained in roundish one or many-celled indehiscent heads. Plants simple, aquatic

Very few plants are found in this order Their vegetation is various, they are at most a few inches high, and are more or less aquatic In Isoetes the leaves resemble those of a young rush The organs of reproduction are always near the root, and are variable, and their nature is by no means understood In Pilularia (*a*) it consists of a roundish head, divided internally into 1-4-cells, each cell containing small bodies of two kinds In Isoetes (*b*) the fructification is even less known and understood

2214 *Isoetes* Head membranous, not opening, immersed in the base of the frond, 1-celled. Sporules angular, inserted upon many filiform receptacles

2215 *Pilularia* Heads imbricated, solitary, nearly sessile, globose, coriaceous, 4-celled. Cells containing two kinds of bodies

History, Use, Propagation, Culture,

2214 *Isoetes* From ἴσος, equal, and ἔτος, the year, a plant which remains the same through all the seasons A very curious little submersed aquatic, which grows at the bottom of some of the Scotch lakes The leaves are long and cylindrical, whence the English name Quill-wort.

Order 5. MUSCI

Reproductive organs of 2 kinds Theca many-seeded, solitary, furnished with an operculum and columella Plants leafy

Mosses are distinguished from all other similar plants, by the peculiar nature of the reproductive organs, which are of two kinds The principal and the most obvious is a theca (*a, b*), which is furnished with an operculum or lid (*c*), by means of which the sporules are retained in the theca, and a columella, or central axis, to which they are attached The other consist of minute spherical pedicellated organs, concealed in the axils of some of the leaves, and called anthers by Hedwig. The theca is either entire, or split into four valves, as in Andreæa, when in a very young state it is enclosed in an indusium, which is torn asunder as the theca is elongated, and being carried up with it, remains upon the summit of the theca in the form of a little extinguisher called

14648 Fronds subulate half-cylindrical, Heads roundish 2-celled

14649 Filiform branched creeping, Heads brown

and Miscellaneous Particulars

2215 *Pilularia* From *pilula*, a pill The little heads in which the reproductive organs are enclosed resemble pills An obscure little plant found creeping among grass in meadows in many parts of England, and especially in damp places which are overflowed during winter

---

calyptra (*d*), if the calyptra is slit up one side it is called *dimidiate* (*d*), if divided at the base into many short clefts, it is termed *mitriform* (*e*) The orifice of the theca, when the operculum is removed, is either covered by a simple membrane, or by various processes called the *peristome* (*f*), either annular, or in the form of teeth, and arranged in a single or double row These processes vary in number, and in the manner of their division, from such differences excellent characters for the genera have been obtained

The minute attention which mosses have received in modern times has brought their arrangement to a degree of perfection unknown in other Cryptogamic orders This has been effected by the labor of Hooker, Greville, and Brown in our own country, and of Hedwig, Swartz, Bridel, Schwaegrichen, Palisot de Beauvois, Nees von Esenbeck, and Hornschuch abroad The arrangement of the two last authors is chiefly adopted here from their excellent Bryologia Germanica

With this order, the alteration in the form of our page, of which we have already spoken, commences The columns indicating the *habit*, *habitation in the garden*, *propagation*, and *soil*, are necessarily omitted, and their place is supplied by a more extended *popular character*, and more detailed references to plates. The heights indicated are to be understood as in inches, and not as feet, and the colors as the general color of the plant In the figures it has been also found necessary to represent the plants in many cases much magnified, whenever this has taken place, the figures which are larger than nature are distinguished by a * affixed to their number The popular synonyms of this and the succeeding orders have been rendered as complete as possible, especially with reference to Sowerby's English Botany, to which valuable work this will be a complete modern index even in Cryptogamia

TRIBE I EVAGINULATI

Theca entirely sessile; its receptacle stalked, and without perichætial leaves

2216 *Sphagnum* Receptacle of theca stalked Peduncle resembling a fruitstalk Theca sessile on the receptacle Mouth naked

TRIBE II. VAGINULATI OLOCARPI

Theca more or less stalked: with perichætial leaves; not valvular.

A. *Theca terminal*

* *Theca indehiscent*

2217. *Phascum* Theca entire, adnate with the persistent lid Calyptra shorter than the theca.

*** Theca dehiscent. Peristome absent.*

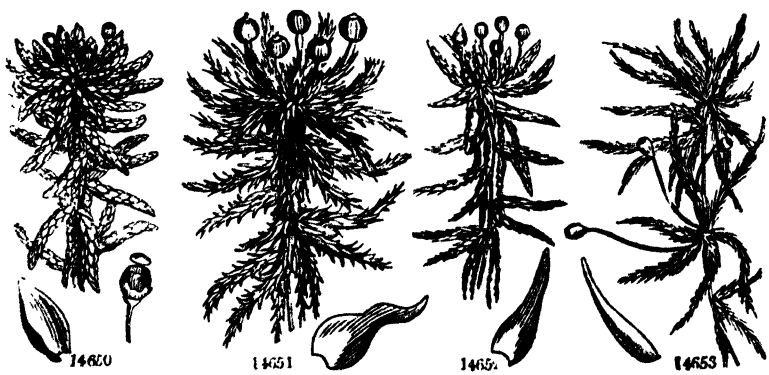
2218. *Schistostega.* Fruitstalks terminal, mouth of theca naked. Lid laciniated, with deciduous segments.
2219. *Gymnostomum.* Fruitstalk terminal Calyptra dimidiate. Mouth of theca naked.

**** Theca dehiscent Peristome present.*

† Peristome single.

2220 *Hymenostomum* Fruitstalk terminal. Peristome destitute of teeth, but having an inner horizontal membrane perforated in the middle
2221 *Tetraphis* Fruitstalk terminal Peristome of 4 erect teeth.
2222. *Encalypta* Fruitstalk terminal Peristome single of 16 teeth Calyptra cylindrico-campanulate, wholly concealing the nature of the theca.
2223 *Grimmia.* Fruitstalk terminal. Peristome single, of 16 entire or perforated rarely cleft teeth. Calyptra mitriform.
2224 *Weissia* Fruitstalk terminal. Peristome single, of 16 entire equidistant teeth Calyptra dimidiate.
2225 *Dicranum* Fruitstalk terminal. Peristome single, of 16 bifid equidistant teeth Calyptra dimidiate.
2226. *Trichostomum* Fruitstalk terminal. Peristome single, of 16 equal teeth divided to the base, or 32 in pairs. Calyptra mitriform
2227 *Cinclidotus* Fruitstalk terminal. Peristome single, of 32 filiform twisted teeth anastomosing at their base Calyptra mitriform
2228. *Tortula* Fruitstalk terminal. Peristome single, of 32 filiform twisted teeth, nearly free, or more or less united by a tubiform membrane. Calyptra dimidiate.
2229 *Pterogonium.* Fruitstalk lateral Peristome single, of 16 entire equidistant teeth Calyptra dimidiate
2230 *Didymodon.* Fruitstalk terminal Peristome single, of 16 bifid equidistant teeth. Calyptra dimidiate.
2231 *Splachnum.* Fruitstalk terminal Peristome single, of 8 geminate teeth. Theca with an evident apophysis Columella exserted, capitate Calyptra mitriform.
2232 *Conostomum* Fruitstalk terminal Peristome simple; teeth solitary, entire, separate at base, 16 in number, united at the tips

†† Peristome double



2233. *Orthotrichum* Fruitstalk terminal Peristome mostly double, outer one of 16 teeth, approaching in pairs, inner one of 8-16 ciliary processes or none Calyptra mitriform. Columella capitate
2234. *Zygodon.* Fruitstalk terminal Peristome double or simple, teeth in pairs Calyptra cucullate
2235. *Disphyscium* Fruitstalk terminal. Peristome always double, outer with 16 teeth: teeth obscure. Theca subsessile.

History, Use, Propagation, Culture,

2216. *Sphagnum* A name employed by Pliny to distinguish some kind of moss that grew upon trees In this genus the theca is sessile, being entirely destitute of a real fruitstalk That which appears like one is the footstalk of the receptacle, which in most of the Sphagna is so much lengthened out as greatly to exceed the verticillated leaves. All the species agree in the peculiar structure of the leaves, of which the reticulation is

2236 *Buxbaumia.* Fruitstalk terminal. Stem none Theca oblique, gibbous. Peristome double · outer one of many filiform, torulose processes, inner one of a conical plicate membrane Calyptra mitriform
2237. *Funaria* Fruitstalk terminal Peristome double, oblique, outer and inner ones each of 16 teeth, opposite to each other
2238 *Bartramia* Fruitstalk terminal Theca subglobose Peristome double. outer one of 16 teeth, inner one of a membrane cleft into 16 bifid segments Calyptra dimidiate.
2239 *Pohlia* Fruitstalk terminal Peristome double: teeth separate acute; membrane with 16 processes, which are entire at the end without cilia
2240 *Bryum* Fruitstalk terminal Peristome double · outer one of 16 teeth, inner one of a membrane cut into 16 equal segments, with filiform processes often placed between them Calyptra dimidiate
2241 *Polytrichum.* Fruitstalk terminal Peristome double outer one of 32 or 64 equidistant incurved teeth, inner one of a dense horizontal membrane connected with the outer teeth. Calyptra dimidiate

B *Theca lateral.*

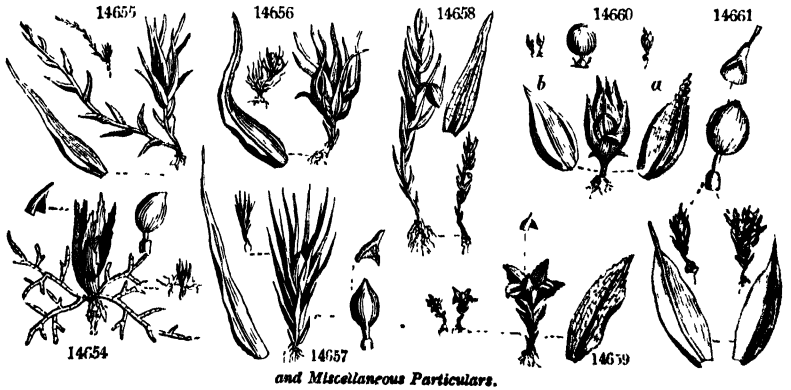
2242 *Anictangium.* Fruitstalk lateral Calyptra mitriform Mouth of theca naked
2243 *Fissidens* Fruitstalk lateral Peristome simple Calyptra smooth Teeth bifid.
2244 *Leucodon* Fruitstalk lateral Peristome simple, with bifid processes
2245 *Fontinalis* Fruitstalk lateral Peristome double outer one of 16 teeth, inner one of 16 ciliary processes formed by transverse bars into a reticulated cone Calyptra mitriform
2246 *Anomodon* Fruitstalk lateral Peristome double the first of 16 teeth, the second of 16 ciliary processes arising from the teeth Calyptra dimidiate
2247 *Neckera* Fruitstalk lateral Peristome double outer one of 16 teeth, inner of 16 ciliary processes, connected only at the base by a short membrane Calyptra dimidiate
2248 *Daltonia* Fruitstalk lateral Peristome double membrane figured, with 16 cilia and reflexed teeth
2249 *Hookeria* Fruitstalk lateral Peristome double outer one of 16 teeth, inner one of a membrane cut into 16 entire segments Calyptra mitriform
2250 *Leskea* Fruitstalk lateral Peristome double Membrane with 16 entire processes Teeth erect or reflexed. Calyptra cucullate
2251 *Hypnum* Fruitstalk lateral Peristome double outer one of 16 teeth, inner of a membrane cut into 16 equal segments, with filiform processes often between them Calyptra dimidiate

TRIBE III VAGINULATE SCHISTOCARPI

Theca more or less stalked, with perichætial leaves, valvular

2252. *Andreæa.* Theca 4-valved · valves cohering at apex, and adnate with the persistent lid.

EVAGINULATI



14650 Branches tumid, Leaves ovate obtuse

History, Use, Propagation, Culture,

which are not only amongst the minute of mosses, and often scarcely discernible to the naked eye, but also extremely dissimilar in appearance to each other

2218 *Schistostega* From σχίζω, to split, and στέγη, a covering, in allusion to the singular character of the lid splitting at the margin The only known station for this minute moss is said by Dr Hooker, from whose Muscologia Britannica, many of the remarks in this work upon the genera of mosses are borrowed, to be in the road from Zele to South Lawton church, near Okehampton, Devonshire

2219 *Gymnostomum* From γυμνος, naked, and στομα, the mouth, in allusion to the processes called teeth, from the orifice of the theca Very minute plants, many of which are barely distinguishable by the naked eye

** *Creeping shoots none*

14655 Leaves entire lanceolato-subulate, Innovations elongated
14656 Leaves lanceolato-subulate flexuose crisped when dry

14657 Leaves subulato-setaceous straight their nerve disappearing below the point
14658 Leaves lanceolato-subulate straight their nerve disappearing below the point, Fruit at length lateral

14659 Leaves patent narrow-ovate serrated their nerve disappearing below the point
14660 Leaves ovato-rotundate acuminate concave connivent, the nerve reaching to the point
α Leaves sharply serrated at point
β Leaves entire
14661 Leaves ovato-acuminate erect their nerve reaching to the point
α Leaves apiculate

β Leaves hair-pointed
14662 Leaves ovate apiculate, Thecæ elliptical
14663 Leaves ovate with a short point, Thecæ globose, Fruitstalk nearly erect
14664 Leaves narrow-ovate acuminated, Thecæ globose, Fruitstalk curved

14665 The only species

* *Stem long, branched.*

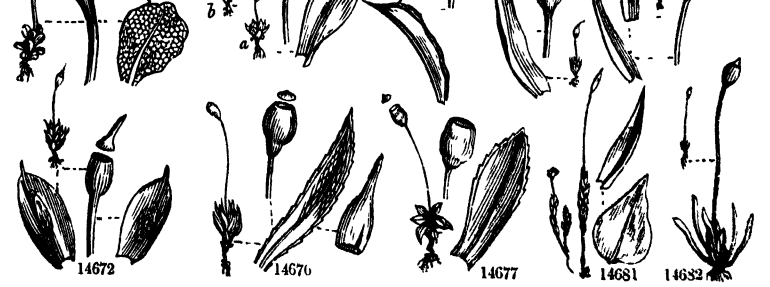
14666 Leaves linear lanceolate crisped when dry perichætial broadly ovate, Thecæ turbinate striated
14667 Lvs lanc twist. when dry the perichætial ones broadly ovate, their marg involute, Thecæ obl smooth

14668 Leaves broadly lanceolate, Thecæ ovate, Lid obliquely rostrate

14669 Leaves subulate, Thecæ turbinate ovate, Lid obliquely rostrate

14670 Lvs lin subul spreading flexuose twisted when dry, Thecæ ovate, Lid conical rost. shorter than thecæ

** *Stems short simple*



14671 Lvs obov-rotund reticul their nerve disappear below summit, Fruitstalk carnose thick, Lid hemispher.
14672 Lvs ovate erect concave piliferous their nerve furnished with a granuliferous membrane, Lid rostrate
α Thecæ ovate
β Thecæ oblong
14673 Leaves ovate apiculate patent nearly plane, Lid obliquely rostrate

14674 Leaves lanceolate serrated at the point, Thecæ ovato-oblong, Lid obliquely rostrate

14675 Leaves oblongo-obovate apiculate, Thecæ ovate, Lid conical obtuse
14676 Leaves oblongo-acum nearly plane subserrated margined, Thecæ pyriform, Lid plane submammillate
14677 Leaves ovato-acum concave serrated not margined, Thecæ roundish obovate, Lid convex shortly rost
14678 Stem scarcely any, Outer leaves very short ovate lanceolate inner ones linear lanceolate, all erect obtuse with a strong nerve disappearing below the summit, Thecæ oblong
14679 Stem very short, Leaves subulate straight, Thecæ turbinate

[subulate incurved
14680 Lvs broadly subul : marg involv. above flexuose crisped when dry, Thecæ ellipt. contracted at mouth, Lid

14681 Stems elongated, Leaves ovato-acuminate those of the perichætium lanceolate, Thecæ cylindrical
14682 Stems very short, Lvs few lin slightly incrassated upw those of perichætium ovate obtuse, Thecæ ovate

and Miscellaneous Particulars

2420 *Hymenostomum.* From ὑμην, a membrane, and στομα, a mouth. This genus differs from the last in having a membrane stretched across the orifice of the theca, a character first discovered by Mr Brown. Minute plants, with the habit of Gymnostomum.

2221 *Tetraphis* The peculiar character of this genus is to have four teeth (τετρα, four). The lid in the only known species of this genus is remarkably thin and scariose in texture, and the teeth are reticulated, not striated as in most mosses The calyptra is striated or furrowed, the leaves are rigid.

History, Use, Propagation, Culture,

2222. ***Encalypta*** From εν, within, and καλυπτρα, a covering or extinguisher, on account of the unusual size of the calyptra, which entirely encloses the theca, a character by which the genus may be distinguished at first sight. Small plants, forming imperfect tufts of green among moist rocks, or on mud-capped walls

2223 ***Grimmia.*** Named in honor of J. J. C. Grimm, a German botanist, who published a Flora of Eisenach

[Calyptra toothed at the base

14683 Stems elong Lvs. elliptico-lanc somew obt. · nerve not produced beyond sum. Thecæ cylind. spiral striat
14684 Stems short, Leaves oblongo-elliptical obtuse their nerve produced a little beyond the summits, Thecæ cylindrical smooth, Calypt entire at the base
14685 Stems short, Lvs obl acum nerve produced considerably bey. summ. Thecæ cylind. Calyp. tooth. at base
α Leaves apiculate their points of the same color, Theca smooth
β Leaves much acuminate their points diaphanous, Theca smooth
14686 Leaves oblong acute nerve as long or longer than the leaves, Theca straight striated

** Fruitstalks scarcely any*

14687 Stems branched, Leaves ovato-lanceolate recurvo-patent · their margins reflexed, the perichætial ones having their nerve disappearing immediately below their summits, Thecæ ovate sess. Lid shortly rost.
α Leaves broad dark-green
β Stem long, Leaves narrow and rufous [running beyond summits, Theca ov sess Lid shortly rost
14688 Stems short pulvin Lvs lanc acum nearly erect crisp when dry marg. recurv ; perich ones with nerve

*** Fruitstalks longer than leaves*

14689 Stem scarcely any, Lvs lin -subulate crisped when dry, Theca ovate, Fruitst geniculate, Lid rost straight
14690 Stems short pulvinate, Leaves narrow elliptical their margins recurved, points diaphanous piliform, · Theca ovate striated, Fruitstalks curved, Lid conical acuminate
14691 Stem rather short, Lvs ov with long white pilifer points, Footst very short, Theca ov Lid obscurely rost
14692 Stems short, Leaves lanceolate acuminate carin entire much crisped when dry their margins recurved, those of the perichætium broad and convol Theca turbinate, Lid rostrate
14693 Stems slightly branched, Leaves lanceolate-subulate gradually produced into long diaphanous hair-like points their margin incurved, Theca ovate, Teeth of the per tome often perfora and split, Lid rost
14694 Lvs lanc subul carin recurv at edge with a hair-like point, Seta curv and flex Theca ov ellipt Lid rost
14695 Stems short, Leaves lanceolate-subulate produced into long diaphanous hair-like points. their margin incurved, Theca ovate, Teeth of the peristome quite entire, Lid shortly rostrate

** Theca with an apophysis*

14696 Lvs. lingul rounded at top. nerve disappear before summ Theca obov Apophy obcon. Lid convex acum

14697 Leaves ovato-lanceolate acute, Theca (with the apophysis) narrowly pyriform, Lid nearly plane

*** Theca destitute of an apophysis*

1 Leaves ovate or lanceolate

14698 Stems scarcely any, Leaves ovato-lanceolate nerveless, Theca ovate gibbous on one side cernuous

14699 Stems elongat Lvs lanc acum Theca obovate cernuous gibbous sulcate, Lid hemispheric obtusely point [erect-cernuous, Lid rostrate
14700 Stem simple short, Leaves broad and bluntly ov with a short point imbric Nerve shorter than leaf, Theca
14701 Stems very short, Lvs ov with an excurr nerve, Theca ov erect, Lid conical, Teeth of perist subul acute

14702 Stems very short, Lvs ov with an excurr nerve, Theca ov erect, Lid conic Teeth of perist subulate acute

14756 Stems short, Leaves lanceolate acum. the margins of those of the stem remarkably revolute, perichætial leaves sheathing, their sides involute, Theca oblong, Lid rostrate shorter than the theca
14757 Stems branched, Leaves linear-lanceolate obtuse their nerve produced into an apiculus, the marg nearly plane, Theca oblong, Lid rostrate nearly as long as the theca

14758 Stems short, Lvs obl rather obt nerve not protruded, perichæt remarkably convol Theca obl. Lid rost.

[above half-way up, Fruitstalks very short, Lid rostrate
14759 Stems much branch Branches pinn Lvs lingul obt ent crisp when dry marg recurv , nerve reaching
14760 Branches fasciculed curved, Leaves broadly ovate acute concave their margins plane, summits serrated, faintly 2-nerved at the base, Lid conical
14761 Stems irregularly branched curved, Leaves ovate subacuminated concave their margins recurv. serrated; nerve single or forked shoots faint, Lid conical

14762 Stems scarcely branched, Leaves lanceolate acuminate carinate their margins recurved entire, Theca ovato-cylindraceous oblique substrumose furrowed when dry, Lid conical

14763 Leaves bifarious from a sheathing base subulate, Theca ovate inclined, Lid conical

14764 Leaves obovate shortly apiculate their nerve incrassated above, Theca ovate erect, Lid shortly rostrate

14765 Stems more or less elongat Lvs oblon -ov flexu strongly serrat at point, Theca erect cylindrac Lid rost

14766 Leaves closely imbricated on all sides lanceolate much acumin carinate with the rigid nerve running beyond the point, Theca oblongo-ovate erect, Lid rostrate
14767 Leaves rather distant somewhat trifarious linc rather obtuse carinated with the nerve scarcely reaching to the point, Theca oblongo-ovate erect, Lid rostrate

and Miscellaneous Particulars.

the banks of the sea shore to the limits of perpetual snow The character from which the genus has received its designation, will always indicate the species with perfect truth

2229 *Pterogonium.* A name altered by Swartz from the Pterigynandrum of Hedwig, which was contrived to express that the male and female flowers of this genus of mosses are both present on a pinnated stem. An elegant collection of species, generally found in subalpine countries, where they enliven the trunks of trees and rocks with their bright green trailing entangled stems, which have altogether the habit of Hypnum. P Smithii has only been found in this country upon trees in the southern counties, especially in Devonshire.

2230. *Didymodon* So called, by Hedwig, from διδυμος, double, and οδους, a tooth, in reference to the geminate

History, Use, Propagation, Culture,

arrangement of the teeth of the theca In natural habit, the plants of this genus approach on the one hand to Weissia, and on the other to Dicranum With the former, Dr Hooker observes that two species are liable to be confounded, viz Didymodon inclinatum, and D heteromallum, each of which has but sixteen teeth, and their approximation in parts is with difficulty discoverable D inclinatum is a very rare plant, having been scarcely found any where in this country, except upon the mountains of Connemara, in Ireland

2231 *Splachnum* Σπλαχνος was one of the Greek names of moss Generally elegant little plants, with thecæ of exquisitely beautiful forms The annual species are usually found growing upon dung, while the perennial are found in more permanent situations They are in all cases of rare occurrence S Frolichianum was found on the summit of Ben High, in the Scotch Highlands

2232 *Conostomum* From κωνος, a cone, and στομα, a mouth, the teeth of the theca being always united at

14768 Stems elongated, Leaves nearly distichous subulato-setaceous, Theca erect ovato-cylindrace. Lid conical

14769 Stems rather short, Leaves subsecund subulate, Theca ovate cylindraceous, Lid conical

14770 Leaves lanceolate subulate tortuose when dry, Nerve strong, Theca suberect ovate, Lid obliquely rostrate
14771 Stem branched erect, Leaves lanc. acum. spreading, Nerve reaching apex, Theca oblong with a short lid

14772 Leaves obovato-rotundate acuminate slightly serrated, Apophysis ovate globose wider than the theca

14773 Leaves obovato-acuminate serrated, Apophysis obconical narrower than the theca, Columella exserted

14774 Leaves ovato-lanceolate much acuminat concave entire, Apophysis obovate nearly as narrow as the theca
α Deeper color with shorter stems
β Paler colo with longer stems

[than the leaves
14775 Lvs ovato-lanc much acuminat serrat Apophy obov somew narrow than theca, Fruitst scarcely longer
14776 Leaves ovato-lanceolate acuminated serrated, Apophysis inversely flagon-shaped twice as wide as theca

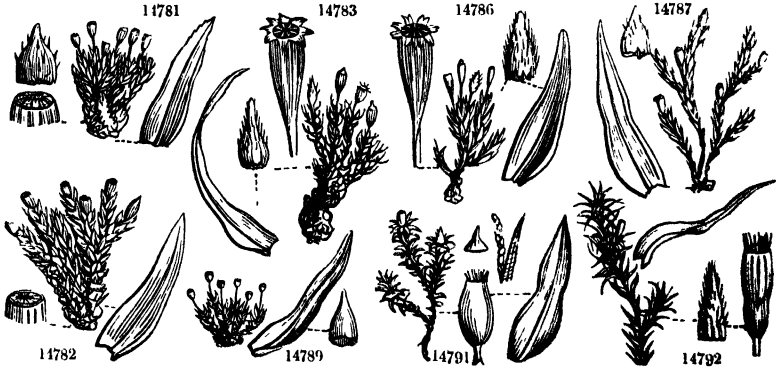
14777 Lvs rhombo-rotund obt · the nerve disappearing before point, Apophysis globose much wider than theca

14778 Lvs ov. rounded at points nerve disappear before summ Apophysis obovate much narrower than theca

14779 Stems rather short, Leaves lanceolate acuminated carinated slightly toothed

** Peristome without ciliary processes*

14780 Lvs obl lanc slightly curl Theca clav furrow Lid with a long beak, Teeth 16 simple, Calyptra very hairy
14781 Leaves lanceolate erecto patent, Fruitstalks exserted, Peristome of 8 double teeth, Calyptra slightly pilose
14782 Leaves lanc erecto-patent, Theca nearly sessile, Peristome of 16 double teeth, Calyptra slightly pilose



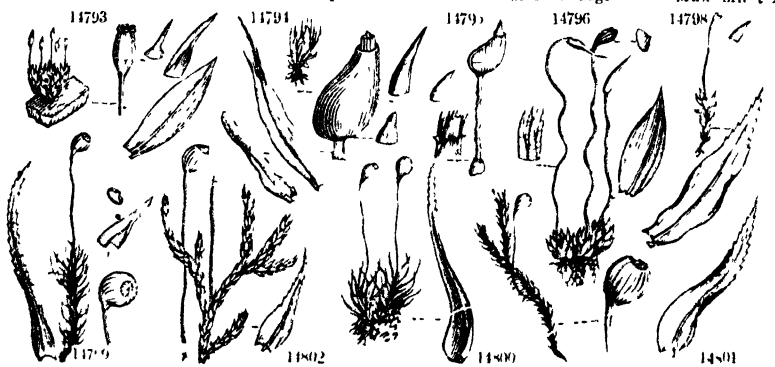
*** Peristome with 8 ciliary processes*

14783 Leaves lanceolato-subulate much crisped when dry, Fruitstalk much exserted, Theca striated, Peristome with 8 ciliary processes, Calyptra very pilose
14784 Leaves erect spreading narrow-lanceolate crisp when dry, Theca pyriform smooth plaited and contracted at orifice, Calyptra very hairy
14785 Lvs erect rigid broad-lanc Theca somew immersed striat toward mouth, Teeth 16, Calyptra very hairy
14786 Leaves lanceolate erect and nearly straight when dry, Fruitstalks much exserted, Theca striated, Perist with 8 ciliary processes, Calyptra very pilose
14787 Leaves patent broadly lanceolate, Theca sessile, Peristome with 8 ciliary processes, Calyptra subpilose

**** Peristome with 16 ciliary processes*

14788 Stems short, Lvs lanc acum points diaphan Theca sess Perist with 16 ciliary process Calypt. subpilose

14789 Stems short, Lvs pat narr lanc crisp when dry, Footst exserted, Perist with 16 slender ciliary processes, Calyptra subpilose
14790 Stems elongated much branched, Leaves broadly lanceolate obtuse, Theca sessile, Peristome with 16 slender ciliary processes, Calyptra smooth
14791 Stems elongated branched, Leaves lanceolate-patent slightly twisted when dry, Theca sess ovate smooth, Peristome with 16 torulose ciliary processes, Calyptra subpilose
14792 Stems elongated much branched, Leaves long linear lanceolate recurvo-patent much crisped when dry, Theca obl striat Peristome with 16 rather broad distinctly jointed ciliary processes, Calypt very hairy



and Miscellaneous Particulars

the points A curious genus, first established by Swartz, in Schrader's Journal The British species approaches in habit to Bartramia fontana It is quite an alpine plant, not growing in Switzerland at a lower elevation than 7 or 8000 feet With us it inhabits the summits of the highest Scotch mountains, particularly in the Breadalbane district.

2233 *Orthotrichum* From ὀρθός, straight, and θρίξ τριχος, hair, on account of the straight, not twisted direction of the teeth of the peristome No genus can be more natural than this, notwithstanding some variations in the peristome of some of the species from the ordinary structure Thus O decipiens and anomalum have no ciliary processes, and O. striatum has them of a peculiar shape and beaded appearance Many of the plants referred to this genus are common occupants of the aged trunks of trees, where they vegetate among the soft earth which collects in the clefts of the dead bark. O Lyellii, which is the finest of our species, is only found on trees in the New Forest.

History, Use, Propagation, Culture,

2234 *Zygodon* From *ζυγὸς*, a yoke, and *ὀδους*, a tooth, and so called, we presume, in allusion to the yoking together by pairs of the outer teeth, but the name is unexplained by its authors A singular plant, which was referred to Bryum by Dickson and to Mnium by Smith The stems grow in a tufted manner like Gymnostomum viridissimum, but rarely exceed half an inch in length The peristome is double, the outer consisting of sixteen short obtuse teeth approaching in pairs, which at length become recurved, inner of as many alternate ciliæ lying horizontally over the mouth of the theca

2235. *Diphyscium* From *δις*, twice, and *φυσκιον*, a vesicle, in allusion to the double nature of the shell of the theca A little plant found in woods, and on rocks in alpine situations The stems are exceedingly short, and grow in densely matted patches The theca is large, ovate, gibbous, and oblique Dr Hooker denies the existence of a double peristome, while Hornschuch asserts its presence

2236. *Buxbaumia* A very singular plant, destitute of apparent leaves, and resembling a minute fungus rather than a moss. It was named in honor of John Christian Buxbaum, a German botanist, who published, in 1728, an account of the plants of Asia Minor in five centuries of figures of little merit This plant was originally discovered in the vicinity of Astrachan, afterwards in a fir-wood near Norwich, and lately in two stations in Scotland Its minute size and want of foliage may have caused it to be overlooked

2237. *Funaria* From *funus*, a rope, in allusion to the twisted nature of the strongly hygrometrical fruit-stalk. This genus, though sufficiently characterized by the interior teeth or ciliæ being oblique and placed

14793 The only species

14794 The only species

14795 The only species

14796 Leaves very concave ovate apiculate entire, Nerve excurrent, Fruitstalk curved flexuose
14797 Stems short, Lvs conc ov suddenly acuminat serrat · the nerve disappear. below point, Fruitst straight
14798 Stems elongat Lvs plane ov -lanc gradually acuminat serrat Nerve disappear bel point, Fruitst. straight

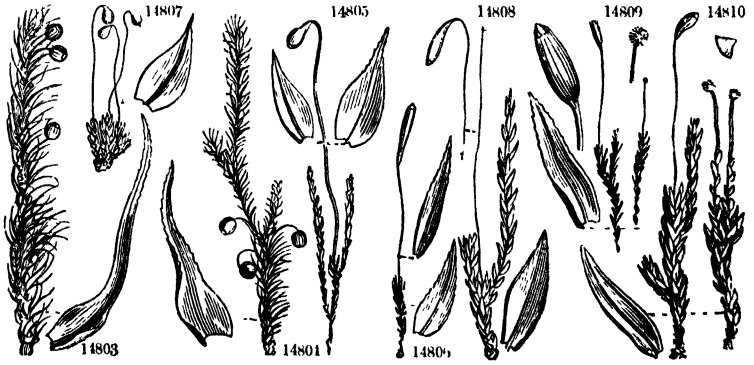
** Fruitstalks long, not curved*

14799 Leaves patent subulate strongly serrated the nerve reaching to the summit twisted when dry
α Leaves flexuose
β Leaves crisp [into the substance of the leaf straight when dry, Fruitstalks much elongated
14800 Stems short, Leaves rigid erecto-patent subulate-setaceous almost entire the nerve half-way up passing
14801 Stems elongated, Leaves recurvo-patent lanc candiculate serrat Fruitstalks lateral from innovations
14802 Stems fastig Lvs closely imbricat rig erect broadly ovate or l nc. acuminat nearly plane serr Fruitst lat.
α Leaves broad ovate acuminate [from innovations

*** Fruitstalks very short, curved*

14803 Stems much elongat prolifer Lvs long subul flexu serrat above, Fruitst lat from innov very short curv.
14804 Stems much elongated proliferous, Leaves horizontally patent ovato-lanceol acuminated serrat striated, Fruitstalks very short arcuate at length lateral, Theca smooth

14805 Stems short branched with innovations, Leaves ovate acuminated nearly entire · the margins slightly recurved, the nerve running beyond the points, Theca oblong-pyrif pendulous



14806 Stems short, Lvs erect oblong-lanc acuminat serrat Nerve reaching to point, Theca elongato-elev inclined
14807 Stems short, Leaves ovate acuminated entire or very obscurely serrated at the points the marg slightly recurved, the nerve reaching to or beyond the point, Theca between ovate and pyriform pendulous

14808 Stems elongated branched with innovations, Leaves oblong acuminated scarcely serrul margins recurved nerve reaching beyond the point, Theca oblongo-obovate pendulous

** Theca sulcated*

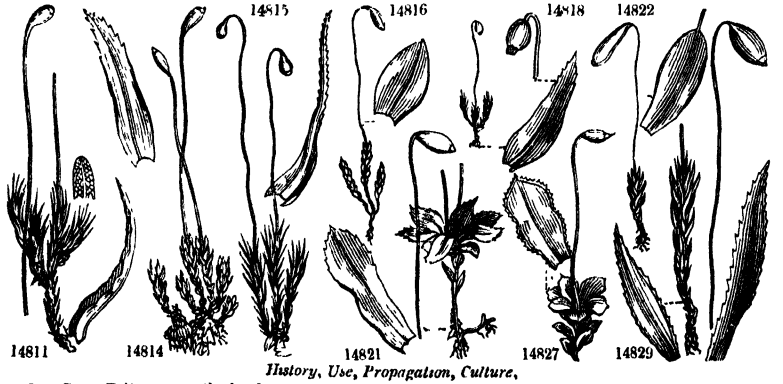
14809 Stems nearly simple, Lvs. lanc serrat their marg recurv Theca nearly erect cylind sulcat. Lid conical

14810 Stems much branch Lvs lanc obt ent their margins revolute, Theca ovate oblique sulcat Lid conical

and Miscellaneous Particulars.

opposite to those of the outer, is further remarkable in these teeth lying horizontally over the mouth of the theca In the male flowers of Hedwig, the succulent filaments are remarkably clavate, jointed, pellucid, the joints containing greenish granules Funaria hibernica has been found only on the roof of a thatched cottage at Blarney, near Cork, Ireland The long flexuose fruitstalk of F hygrometrica, one of the commonest of mosses in almost every situation, possesses strong hygrometrical qualities

2238 *Bartramia* So called in honor of John Bartram, an Anglo-American, to whose researches in North America the gardens of Europe owe many of their finest trees. He had a son William, who published in 1773, an account of a journey in the interior of North America. This is an elegant genus of mosses, remarkable for their fine capillary light green leaves, and spherical capsules. The genus approaches nearly to Bryum, but differs in almost every species having a spherical capsule, and the sixteen broad segments of the inner peristome, instead of being entire or only perforated, are cleft like the teeth of a Dicranum.



2239 *Pohlia* Named in honor of J E. Pohl, a German botanist. Small plants, often refered to Bryum, with which they entirely agree in habit

2240 *Bryum* One of the ancient Greek names of moss These are all dwarf plants producing capsules in abundance, and generally found growing in wet places In B palustre are found terminal capitular bodies, which much resemble what are called the anthers of B androgynum; but in B palustre they are considered gemmæ, and arise not only from the main stems, but also from the innovations B triquetrum has only been

History, Use, Propagation, Culture,

found in Great Britain upon the borders of some lake in the north of Ireland By Mohr it is considered a distinct genus, and called Diplocomium.

** *Theca destitute of furrows*

A *Exterior peristome shorter than interior*

14811 Stems somew. branch Lvs lin obt ent reticulat Theca obovate recurved subcernu Fruitstalk very long
14812 Stems branched, Leaves ovate cuspidate reticulated shorter than nerve, Theca curved pyriform pendulous
14813 Stem elongat branch Lvs lanc carin ac serrated reticulat. Theca pyrif erecto-cernu Fruitst. very long
14814 Stems short, Leaves lanceolate acute plane serrated at the points reticulated, Theca pyriform nearly erect

B. *Peristomes equal*

§ 1 *Leaves without a thickened margin*

14815 Stems slightly branched, Leaves subul -setaceous flexuose serrated nerve very broad, Theca pyrif. pendul

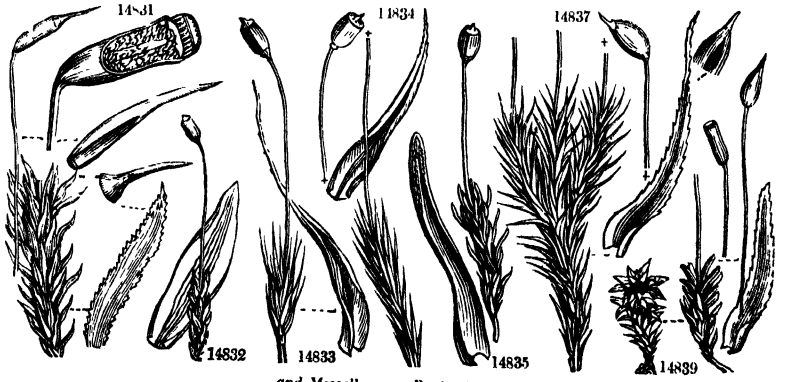
14816 Stems branched, Leaves closely imbricated broadly ovate concave entire obtuse nerve running nearly to the point, Theca obovato-cylindraceous pendulous
14817 Stems simple, Leaves rigid lanceolate the upper ones the narrowest and longest, all of them plane serrul nerve disappearing below the summit, Theca oblong-subpyriform cernuous
14818 Stems simple, Lvs lanc reticulat slightly serrul at point nerve disappear bel summ Theca obov pendul
14819 Stems branched, Leaves closely imbricated broadly ovate suddenly and sharply acuminated subserrulate very concave nerve disappearing below the point, Theca ovato-pyriform pendulous
14820 Stems branch Leaves closely imbricated more or less broadly ovate acuminulate very concave reticulated entire nerve running nearly to the point, Theca clavate cernuous
14821 Lvs obovato-spathulate acute serrated undul nerve running to the point, Theca oblongo-ovate pendul
14822 Stems short, Leaves obovate twisted when dry entire their nerve produced into a hair like point, their margins slightly thickened, Theca oblong pendulous
14823 Stems short, Lvs erect lanc acuminated serrated above nerve reach to point, Theca oblon pyrif pendul

14824 Stems rig elongat branch Lvs closely imbricat erect lanc somew obt subserrul at apex marg revolute, nerve reaching to the points, Theca oblongo-ovate pendulous

§ 2 *Leaves with a thickened margin*

14825 Stems elongated, Leaves obovato-rotundate very obtuse reticulated their margins thickened entire, nerve disappearing below the point, Theca ovate pendulous, Lid shortly rostrate
14826 Stems elongated, Leaves undul ligul reticulated their margins thickened denticul, nerve reaching a little beyond the point, Theca ovate pendulous, Lid conical
14827 Stems elongated, Leaves broadly ovate reticulated their margins thickened denticulated, the nerve reaching a little beyond the point, Theca ovate pendulous, Lid rostrate
14828 Stems elongated, Leaves ovate acute reticulated their margins thickened serrated, nerve reaching a little beyond the point, Theca ovate pendulous, Lid shortly rostrate
14829 Stems elongated, Leaves lanceolate acute reticulated their margins thickened denticulate, nerve generally disappearing below the summit, Theca oblongo-ovate pendulous, Lid hemisph mucronulate
14830 Stems elongated, Leaves obovate acute reticulated their margins thickened denticulated above, nerve running beyond the point, Theca ovate pendulous, Lid conico-hemispheric obtuse

* *Calyptra naked*

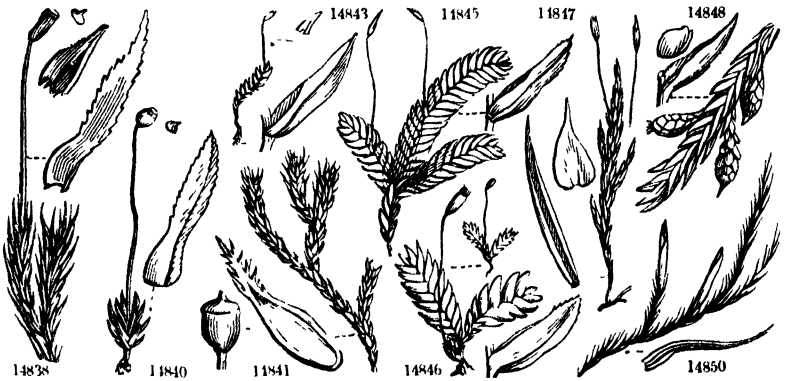


14831 Lvs lanc undul · their margins plane denticulat, their nerve winged, Theca cylind curved, Lid subul
14832 Lvs lanc rig ent their sides involute, their nerve broad impress with furr Theca obl suber Lid conical

** *Calyptra hairy*

14833 Leaves lanceolate-subulate their margins involute ent terminating in a pellucid hair-like point, Theca ovate obtusely quadrangular furnished with an apophysis, Lid conical
14834 Leaves lanceolate-subulate their margins involute entire, their points acumin colored subserrated, Theca ovate obtusely quadrangular furnished with an apophysis, Lid conical
14835 Leaves linear-subul obtuse their margins especially towards the top involute subserrulate, Theca ovate subangulate furnished with a minute apophysis, Lid conical acuminate
14836 Stems elongated, Leaves patent linear-subulate their margins plane serrated as well as the points of the keels, Theca erect ovate quadrangular with an evident apophysis
α Leaves with their margins of the same color
β Leaves shorter with their margins pellucid

14837 Stems elongated branched, Leaves patent subulato-lanceolate the margins plane serrated as well as the points of the keels, Theca subovate with an indistinct apophysis
14838 Stems elongated branched, Leaves erecto-patent lanceolate acute · their margins plane serrated. Theca erect cylindrical destitute of an apophysis
14839 Stems short, Leaves linear-lanceolate obtuse their margins plane serrated principally at the extremity and at the summit of the keels, Theca nearly erect cylindrical without an apophysis
α Fruitstalks 2 inches long, Stems simple



β Fruitstalks very short, Stems branched

and Miscellaneous Particulars

2241. *Polytrichum.* From πολυς, many, and θριξ τριχος, hair, on account of the numerous hairs of the calyptra. Easily distinguished by the rigidity of the leaves and the square form of the theca, which is some

History, Use, Propagation, Culture,

rally covered by a very hairy calyptra · this organ is in some species smooth, by which character they have been distinguished by the accurate Ehrhart, under the name of Catharinea, but Dr Hooker is of opinion that the genus is not tenable

2242 *Anictangium* From *ανικτος*, open, and *αγγειον*, a vase, on account of the open nature of the theca, which is not enclosed by a peristome The only British species are two plants with nerveless leaves, and the habit of Trichostomum

2243 *Fissidens* From *fissus*, split, and *dens*, a tooth, in allusion to the structure of the peristome Plants generally referred to Dicranum by British botanists, but differing from that genus entirely in habit, and sufficiently in characters Dr Hooker remarks, that the structure of their leaves is highly curious, and totally unlike that of any other plant with which he is acquainted Besides being vertical, their upper half (taking the nerve for the line of separation) is, from the base beyond the middle, composed of two equal lamellæ, the lower part of which embraces the stem, and the rest very often embraces a portion of the leaf placed immediately above it.

2244. *Leucodon* Named from *λευκος*, white, and *οδους*, a tooth, from the color of the peristome. The only British species has occasionally been thrown among the Dicrana, Trichostoma, and Pterogonia, from any of which, an attentive consideration of the lateral fruit, deeply divided teeth, and dimidiate calyptra, will keep its genus distinct. The stems are long, and creeping over the bark of trees

2245 *Fontinalis* From *fons*, a fountain, in allusion to the places where it grows F antipyretica is a common plant, floating in large masses in rivers and pools of water The specific name was given it because

14840 Stems short, Lvs. lin lanc. : marg serrat. principally at extrem. as well as summit of keels, Theca nearly [erect subglobose

14841 Leaves ovate much lengthened out and diaphan at points. those of perichætium laciniated at extremity

14842 Leaves ovato-acuminate colored at the points. those of the perichætium serrated at the extremity

14843 Fruitstalks terminal, Perichætial leaves resembling the cauline ones

14844 Like the last, but theca drooping

14845 Fruitstalks lateral, Perichætial leaves ovate slightly convolute pointed

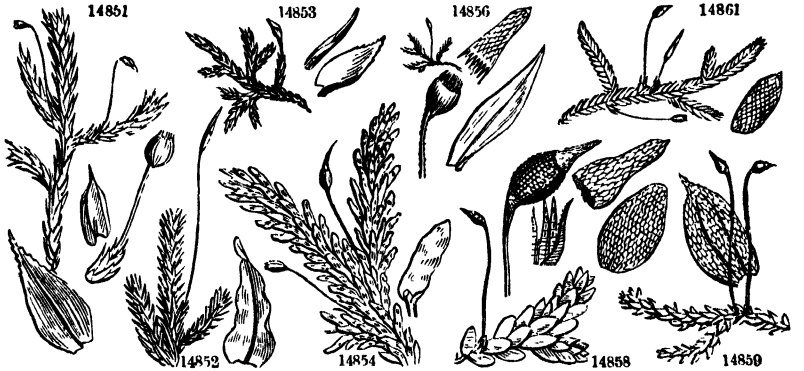
14846 Fruitstalks radicular, Perichætial leaves ovate sheathing involute pointed

14847 Leaves closely imbricated ovate-cordate acuminate striated, Theca oblong

14848 Leaves nerveless for the most part complicato-carinate
14849 Leaves nerveless plane or very slightly concave
14850 Leaves furnished with a nerve slightly concave

14851 Lvs ov acum serrul. : the nerve disappear below point, Fruitst twice as long as perichætium, Theca ov

14852 Leaves ovato lanceolate obtuse entire the nerve reaching to the point, Fruitst. very long, Theca cylind.



14853 Lvs ovato-acum slightly concave. marg recurv Fruitst scarcely longer than perichæt lvs Theca oblon -ov
14854 Leaves oblong acuminulate transversely rugose, Fruitstalks much exserted, Theca ovate
14855 Lvs bifar ov lanc transversely undul serrul at point, Theca ovate subsess shorter than perichætial lvs.

14856 Leaves oblongo-lanceolate, Fruitstalks long, Calyptra fimbriated at the base

14857 Leaves broadly ovate acute, Theca sessile impressed, Calyptra nearly entire

14858 Leaves broadly ovate entire obtuse nerveless
14859 Lvs ov acuminul margin very obscure serrat at extrem with 2 nerves nearly reach their whole length

14860 Lvs. broadly scymitar-shaped serrat at point nerve reach to middle of leaf, Theca ovate erect, Lid rost
14861 Leaves oblong apiculate entire nerveless, Theca ovate erect, Lid rostrate

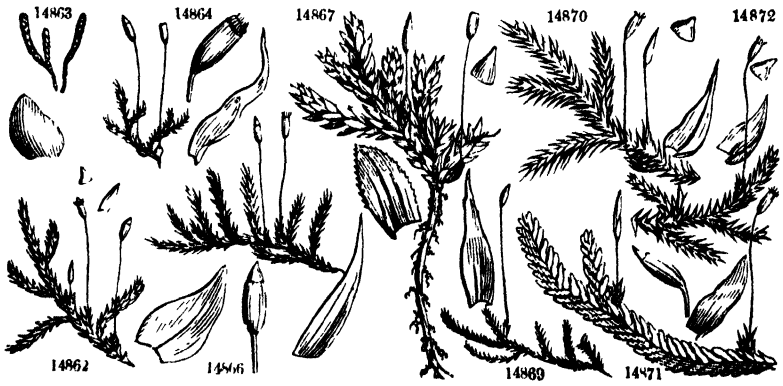
and Miscellaneous Particulars

it is employed by the Swedes to fill up the spaces between the chimney and the walls, and thus, by excluding the air, to prevent the action of fire

2246. *Anomodon* So called by the authors of Muscologia Britannica, on account of the peculiar nature of the peristome, which has narrow fringed processes arising from the very same range, and from between the teeth, ανομος, irregular, and οδους, a tooth The stems are dark, almost blackish green, long, cylindrical, and straggling It is not uncommon on the wilds of Dartmoor

2247 *Neckera.* Named after N J. Necker, a German botanist, who published in 1791, his Elements of Botany, a work which contained more useful information than many of his detractors have been pleased to allow Beautiful mosses, found in woods and upon trees and rocks. N crispa has more the appearance of some fine tropical moss, than of those of our own country, where it is far from uncommon in mountainous districts, frequently covering a great extent of surface upon the trunks of old forest-trees.

2248 *Daltonia.* Named in honor of the Rev James Dalton, a skilful English muscologist. The nitriform calyptra separates this from Neckera. D splachnoides has only been found by the side of a streamlet on the Secawn mountain, near Dublin, where it grows sparingly in pale green tufts.



2249. *Hookeria.* This beautiful Hypnum-like genus was named by Sir James Edward Smith, in honor of Dr William Jackson Hooker, F R S, &c professor of botany in the university of Glasgow, one of the most distinguished of modern cryptogamic botanists, and a gentleman whose public reputation is only exceeded by his private excellence. The Hookera of Salisbury, must give way to this on every account. H læte-virens has hitherto been discovered only in a bog near Cork.

2250 *Leskea.* N G Leske was an obscure German botanist, of whom little is known, except that he gave

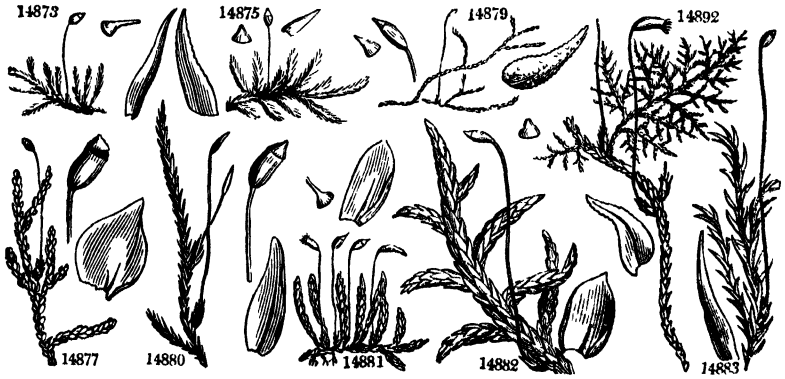
History, Use, Propagation, Culture,

occasion to Hedwig to name this genus after him It has entirely the habit of the next, with which it is frequently united.

14862 Leaves ovate obtuse concave entire : nerve reaching to the summit, Theca cylind. nearly erect, Lid conical

14863 Leaves closely imbricated rotundato-ovate obtuse very concave ventricose nerveless, Theca ov nearly erect

14864 Leaves loosely imbricated the upper ones subsecund, all of them lanceolate acuminate entire nerveless, Theca ovato-cylindrical nearly erect, Lid conical
14865 Lvs erecto-pat lanc acuminat ent striat faintly 2-nerved at base, Theca ovate nearly erect, Lid conical
14866 Leaves erecto-patent lanceolate acuminated entire striated, nerve running to three fourths of the length, Theca ovate cylindrical erect, Lid conical
14867 Stems erect below simple and naked fascicled above, Leaves ovate more or less lanceolate striated serrat. at the point nerve reaching nearly to the summit, Theca erect ovate cylindrical, Lid rostrate
14868 Stems variously branched procumbent, Lvs all of them slightly secund broadly ovate with an attenuated obtuse point. nerve running nearly to the summit, Theca ovate cernuous, Lid conical



14869 Leaves 1-sided imbricated erect spreading ovate lanceolate acum entire obscurely 2 nerved at base, Fruitst. numerous, Theca erect ovate, Lid acutely conical

* *Stems plane*

14870 Lvs ov-lanc acuminat ent the nerve reaching nearly to summit, Theca oblong cernuous, Lid conical
14871 Lvs ov ac transversely undulat with two faint nerves at base, Theca obl furrow arcuato cern Lid rost
14872 Leaves ovate sometimes approaching to lanceolate more or less acuminated having two short nerves at the base, Theca oblongo-cylindraceous inclined, Lid conical
α Leaves ovate lanceolate distant quite plane
β Leaves ovate more or less obtuse slightly concave

** *Leaves spreading on all sides of the stem.*

14873 Lvs fascicul erect lanceolato-subul ent nerve reaching to summit, Theca ovate cernuous, Lid rostrate
14874 Leaves ovato-lanceolate rather obtuse patent entire their nerve for the most part reaching to the summit, Theca cylindrical curved cernuous, Lid conical
14875 Leaves lanceolate acuminated serrated margin slightly reflexed. nerve reaching to the point, Theca ovate nearly erect, Fruitstalks rough, Lid conical
14876 Leaves cordato-acuminate serrated their nerve reaching to the point, their margin slightly reflexed, Theca ovate cernuous, Fruitstalks rough, Lid conical
14877 Leaves loosely imbricated rotundato-ovate obtuse concave entire faintly two-nerved at the base or with one short nerve, Theca ovate cernuous, Lid conical
14878 Leaves closely imbricated nearly erect elliptical apiculate concave entire faintly two-nerved at the base, Theca ovate cernuous, Lid conical
14879 Leaves subpatent ovate subacuminated papillose on the back and margin with a very short nerve, Theca ovate inclined, Lid conical acuminated
14880 Leaves loosely imbricated erecto-patent oblongo-ovate obtuse entire their nerve reaching half way, Theca oblongo-ovate curved cernuous, Lid conical
14881 Leaves nearly erect imbricated oval with a very short point concave entire nerve reaching about half way up, Theca ovate cernuous, Lid rostrate
14882 Leaves closely imbricated oval with a very short point very concave their nerve reaching half way up, Theca ovate cernuous, Lid conical
14883 Leaves loosely imbricated, the upper ones falcate secund, all of them lanceol-subul scarcely serrated at their points their nerve reaching more than half way, Theca ovate obl curved cernuous, Lid conical
14884 Leaves erecto-patent the upper ones sometimes secund, all of them ovato-lanceolate acuminated sub-serrated the nerve reaching above half way, Theca ovate cernuous, Lid conical
14885 Lvs nearly erect lanc acum serrul tow end nerve disappear beyond end, Theca cern Lid acute conical
14886 Leaves erecto-patent lanceolate acuminated entire striated nerve disappearing below the point, Theca ovate cernuous, Fruitstalks rough, Lid conico-acuminated
14887 Leaves erecto-patent narrow lanceolate acuminated nearly entire striated nerve running nearly to the summit, Theca oblongo-ovate curved cernuous, Fruitstalks smooth, Lid conical
14888 Leaves erecto patent ovato-lanceolate acuminated striated entire nerve reaching half way up, Theca ovate cernuous, Fruitstalks smooth, Lid conical
14889 Stems erect below simple and naked, fascicled above, Leaves concave ovate ellipt acute serrated nerve running nearly to the point, marg reflexed, Theca ovate cernuous, Lid rostrate
14890 Branches fascicled curved, Leaves ovato-elliptical concave serrated at the points nerve disappearing beyond the middle, Theca ovate erect, Lid rostrate
14891 Stems tripinnate, Leaves ovate with a suddenly acuminated serrated point concave faintly two-nerved at the base margin below recurved, Theca ovate cernuous, Lid rostrate
14892 Stems tripinnate, Leaves serrated papillose on the back. the cauline ones cordato-acuminate striated with a nerve running nearly to the point, those of the branches more ov with a sing or double nerve at base
14893 Stems subbipinnate, Leaves distantly placed patent cordate or ovate acuminated serrated nerve disappearing below the summit, Theca ovate cernuous, Lid rostrate

and Miscellaneous Particulars

History, Use, Propagation, Culture,

like covering to the surface on which they grow H crista-castrensis is at once the most beautiful and most rare of British species

2252. *Andreæa.* Named by Hedwig, in honor of J G R André, a German botanist, author of Letters upon Switzerland. There was also a Portuguese Andreas de Castro, who published in 1636, a work upon plants He was physician to one of the dukes of Braganza. There was besides a celebrated physician of antiquity

14894 Stems pinnate (or irregularly bipinnate), Leaves thickly set cordato-acuminate serrated very faintly two nerved at the base, Theca oblong cernuous, Lid conical
14895 Stems pinnate, Leaves serrated papillose on the back · the margins reflex , nerve running nearly to the point , the cauline ones cordato-acuminate · those of branches cord. ac Theca cylind inclined, Lid rost
14896 Stems pinn Lvs. serrated smooth on the back · marg. reflexed ; cauline ones cordato-acute with a short nerve, those of branches ovate acum. with nerve disappear bey midd Theca cylind inclin Lid conical
14897 Stems somewhat pinnate, Leaves ovate with a long narrow acumination serrated · nerve disappearing below the middle, Theca ovate cernuous, Lid rostrate
14898 Stems variously branched, Leaves patent ovate acuminated serrated at the points striated : their nerve reaching half way, Theca ovate cernuous, Fruitstalk rough, Lid conical
14899 Stems variously branched, Leaves erecto-patent ovate often approaching to lanceolate acuminat. serrated striated nerve reaching half way, Theca ovate cernuous, Fruitstalks rough, Lid conical
14900 Stems pinn Branches short erect, Lvs. all recurv cord acum. obsol 2-nerv at base, Lid obtusely conical
14901 Stems somewhat pinnate, Leaves serrulate two-nerved at base primary cordate acuminate , of branches broad ovate , Theca ovate cernuous, Lid conical
14902 Leaves loosely set squarrose cord much acuminated ent. nervel. Theca oblongo-ov curv cern. Lid conic

14903 Leaves recurved squarrose lanceolate much acuminated concave serrated striated faintly two-nerved at the base, Theca globoso-ovate cernuous, Lid conical
14904 Leaves loosely imbricated spreading broadly ovate acute serrated concave with a nerve nearly as far as the middle, Theca ovate cernuous, Lid rostrate
14905 Lvs spread cord -acum serrat striat nerve reach beyond midd Theca obl ovate cernu Fruitst smooth
14906 Lvs erect spread ov acum concave serrat their nerve reach. half way, Theca ov cernu Fruitst smooth

14907 Leaves loosely set ovate concave nerveless entire , lower squarrose , upper imbricated in a cuspidate point Theca oblong curved cernuous
14908 Lvs loosely set squarr cord -ov obt concave ent nerve running nearly to point, Theca obl curv cernu
14909 Lvs loosely set squarr cord much acum entire nerve disappear half way up, Theca obl ov curv cernu
14910 Lvs squarr cordato-acum serrat. faintly striated with two nerves at base, Theca globoso-ov Lid conical
14911 Leaves squarrose widely cordate very much acuminated and recurved serrated faintly two-nerved at the base, Theca ovato-globose cernuous, Lid conical

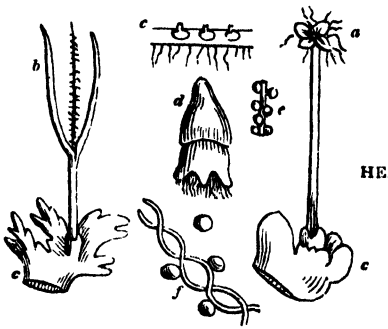
*** *Leaves secund*

14912 Stems subpinnate, Leaves especially the upper ones falcato-secund broadly ovate acuminated serrated : their nerve reaching to the point, Theca oblongo-ovate curved cernuous, Lid conical

14913 Leaves secund ovate somewhat acuminate concave entire margins incurved above , nerve short often forked sometimes obsolete, Theca oblongo-ovate cernuous, Lid conical

14914 Leaves falcato-secund lanceolato-subulate concave or almost semicylind entire the nerve disappearing below the summit, Theca oblongo-ovate curved cernuous, Lid conical
β Leaves wider less falcate [cernuous, Lid conical
14915 Lvs falcato-secund lanceolato-subul serrat striat nerve disappearing below point, Theca cylind curv
14916 Lvs sec ovato-lanc. serrat. nearly plane crisp transverse when dry marg recurv , nerve reach half way
14917 Stems pinnated, Leaves falcato-secund cordate very much acuminated serrated their margins reflexed , nerve disappearing below the summit, Theca oblongo-ovate curved cernuous, Lid conical
14918 Leaves secund broadly ovate ventricose obtuse ent nervel Theca oblongo-ovate curv cernu Lid conical
14919 Leaves loosely imbricated secund narrow-lanceolate acuminated serrated nerveless or very obscurely two-nerved, Theca subcylindrical erecto-cernuous, Lid conical obtuse
14920 Leaves closely imbricated more or less falcato-secund lanceolate acuminated entire, except at the points, which are usually serrated very faintly two-nerved at base, Theca cylind erecto-cernuous, Lid conical

14921 Stems closely pectinated, Leaves falcato-secund ovato-lanceolate acuminated serrulate striated faintly two-nerved at the base, Theca oblongo-ovate curved cernuous, Lid conical
14922 Stems pectinated, Leaves falcate secund cordate acuminated serrated not striated faintly two-nerved at base, Theca oblong ovate curved cernuous, Lid conical

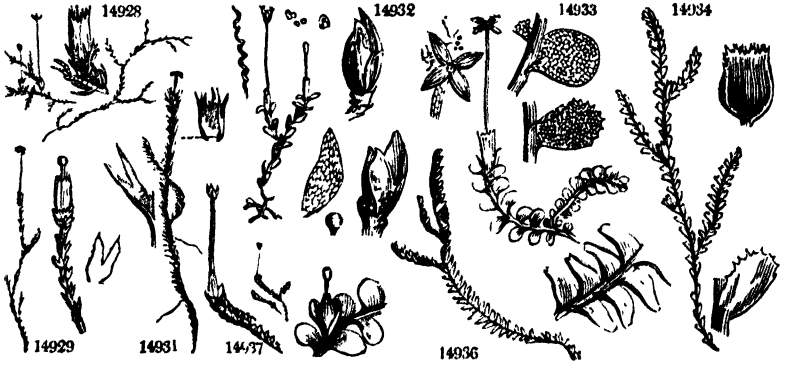


VAGINULATI SCHISTOCARPI

14923 Stems branched, Leaves obovate suddenly acuminate straight imbricating the stem on every side
14924 Stems branched, Leaves ovate gradually acuminated the upper ones falcate
14925 Stems almost simp Lvs lanc subul falcate secund fragile perichætial obl nervel , their marg involute
14926 Stems slightly branched, Leaves loosely imbricated lanc subfalcate secund perichætial similar to cauline

and Miscellaneous Particulars.

named Andreas, who was cited honorably by Pliny This remarkable genus differs from all other mosses, in having a theca which splits into four valves, cohering at their ends by means of the persistent lid , it agrees with Sphagnum in having no fruitstalk, but in its room an elongated receptacle, and appears to be a transition from Musci to Hepaticæ This is, however, only apparent All the species are natives of rocks or mountains, and are remarkable for their nearly black or dark brown color.



Reproductive organs of two kinds 1 *Theca without an operculum, either naked or sessile, or furnished with a veil through which they are more or less protruded. Sporules naked* (e), *or mixed with spiral threads* (f) 2 *Minute roundish or oblong bodies variously situated. Plants frondose of a cellulose structure not submersed*

This order is distinguished from Algæ, with which it was formerly united, by the nature of the theca (*a*, *b*), and of the foliaceous frond (*c*) which is never submersed, and which bears a greater affinity to that of Musci From

History, Use, Propagation, Culture,

2258 *Jungermannia.* Named by Ruppius, to perpetuate the memory of Louis Jungermann, a German

these Hepaticæ differ in being destitute of an operculum or lid to the theca and, with the exception of Marchantia (*d*) and Jungermannia, of a calyptra. The order is composed of seven genera, all very different from each other, and forming an assemblage which is only natural in regard to the organs of vegetation It does not appear possible to reconcile those of reproduction The herbage consists of a variously dilated frond lying flat upon the substance on which it grows, generally naked, but in many Jungermannias covered with small leaves, which are often divided, but never really nerved, so that, in fact, they should rather be considered dilatations of the frond the substance is generally loosely cellular, sometimes compact, as in Marchantia, in which Hooker asserts that pores of the epidermis exist.

2253 *Jungermannia* Theca 4-valved, supported on a peduncle longer than the calyx Valves free
2254. *Marchantia* Theca on the under surface of a common peltate pedunculate receptacle. Anthers imbedded in the disk of distinct peltate pedunculate or sessile receptacles
2255 *Riccia.* Theca spherical, immersed in the frond (not opening), crowned with the style, which is alone protruded
2256. *Anthoceros* Theca stalked, linear, 2-valved, with a central columella to which the sporules are attached
2257 *Targionia* Perianth ? globose, arising from the underside of the extremity of the frond, at length opening vertically into 2-valves Theca globose, nearly sessile, included in the perianth, opening irregularly at the extremity, and filled with spiral filaments
2258 *Sphærocarpus* Thecæ minute, spherical, seated upon obpyriform receptacles, and filled with minute sporules unmixed with filaments.

History, Use, Propagation, Culture,

bourhood of Altdorf, and a work called Cornucopia Floræ Giessensis A genus of obscure plants, forming by their creeping stems little patches upon trees or rocks, or on the earth in damp places. The British

14951 Stem procumbent flexuose branched in a starry manner, Leaves broad-ovate acutely 2-parted : segments folded together with spiny teeth, Fruit terminal
14952 Lvs. subquad acutely bifid segm acute straight ent. Fruit terminal, Cal obl plaited : mouth toothed
14953 Leaves subquadrate obtusely bifid · segments acute, Fruit terminal, Cal oblong plaited mouth toothed
14954 Lvs orbicul concave at extrem lunul emarg. Fruit term upon short prop. central branches Cal obl ov
14955 Lvs. round very conc. bif. : segm long acum incurv. Fr. term upon short prop. branch Cal obl subplicate

c Leaves 3-4-fid · segments equal

14956 Stem prost nearly simp. Lvs round, square lower bifid, upp 3-4-fid, Fr term Cal obl ov somew plait.
14957 Leaves subquadrate waved subtrifid, segm equal here and there toothed, Fruit terminal, Cal obovate
14958 Leaves spreading horizontally quadrate waved obtusely bitricrenate, Fruit terminal, Cal. campanulate, Theca spherical bursting irregularly
14959 Leaves bifarious closely imbricated erect quadrate quadrifid their inferior angles here and there spinul. toothed, Fruit terminal and lateral, Cal oblong plicate · the mouth open

d Leaves bifid segments unequal folded together.

14960 Lvs unequally 2-lobed 4-bifid tooth cili Lobes fold together, lower ones larger obov, upp subcord obt
14961 Stem erect nearly simple, Leaves unequally 2-lobed as deep as base tooth ciliated, Lobes folded together
14962 Lvs. uneq 2-lob Lobes folded together serrated at extrem acute lower ones larger ov, upp round. ov.
14963 Leaves unequally 2-lobed wavy entire, Lobes roundish folded together, lower ones largest, Fruit term. Cal oblong incurved compressed
14964 Leaves roundish nearly equally 2-lobed entire, Lobes folded together, Fr term Cal obl incurv compres.
14965 Leaves unequally 2-lobed folded together with a pellucid line in the middle serrated at the extremity Fruit terminal, Cal obovate cylindrical
14966 Lvs unequally 2-lobed folded together obtuse entire, Fruit term Cal. obov · mouth contracted toothed
14967 Lvs unequally 2-lobed folded together narr ov acute, Fr term Cal ov plaited mouth contract. toothed
14968 Leaves horizontally spreading somewhat folded together upper equally, lower unequally 2-lobed, All the lobes rather acute, Cal obovate
14969 Stem prostrate nearly simple, Leaves unequally 2-lobed, Lobes folded together. lower larger ovate concave acute, upper minute tooth-like
14970 Leaves imbricated on the upper side unequally 2-lobed folded together upper lobes the larger convex bifid and toothed at the extremity
14971 Lvs distich. imbricat above unequ 2-lobed upp lobes larger orbicul, lower ov appres flat, Cal truncat.

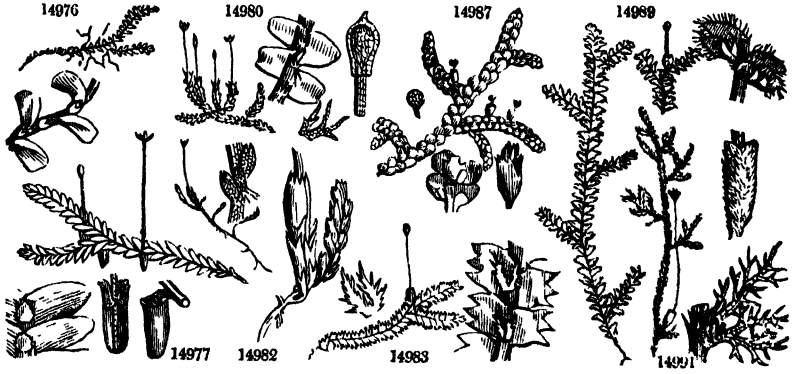
†† Furnished with stipules

** Leaves entire or rarely emarginate*

14972 Leaves orbicular and ovate acuminate, Stipules broadly subulate
14973 Lvs all rounded, Stip broadly subul Fruit term Cal ovate compressed at the extremity truncate 2-lipped
14974 Lvs round concave entire and emarg Stipules broadly subul Fruit terminal, Cal immersed in the leaves
14975 Lvs horizontal rounded quad plane ent. and emarg Stip obl bifid, Fr upon very short proper branches
14976 Stem creeping simple, Lvs rather rem cuneiform ent. or bluntly emarg at end, Stip minute ovate bifid
14977 Leaves horizontal plane ovate entire, Stipules broadly ovate toothed lam. Fr lat. Cal subterr obl fleshy
14978 Leaves horizontal convex ovate ent Stipules round lunate-emarg Fruit lat. Cal subterr obl. fleshy hairy

*** Leaves 2 or 3 cleft segments equal*

14979 Leaves broadly ovate decurrent bifid at the apex segm very acute entire, St pules bitrifid and laciniate
14980 Stem creeping branched, Leaves round-ovate decurrent rarely acutely often obtusely emarginate or entire, Stipules bitrifid, Fruit terminal, Cal ovate
14981 Leaves round acutely emarginate segments acute straight, Stipules large ovate acuminate with a single tooth at the base on each side
14982 Stem nearly erect simple or branched, Leaves ovate concave acutely emarginate, Stipules minute ovate bifid, Fruit terminal, Cal oblong cylindrical little plaited
14983 Leaves rounded quadrate 3-4-fid, Stipules lanceolate acutely bifid their margins lacerated
14984 Lvs very concave nearly hemispherical emarg Stip ovate lanc obtuse, Fruit term. upon short branches
14985 Leaves imbricated above subquadrate incurved acutely 4-toothed, Stip broadly quad 4-tooth. Fr radical
14986 Lvs. imbricat above ov convex obtusely trident Stip. broadly subquad. cren. Fr from lower part of stem



*** Leaves bifid. segments unequal folded together.*

a Lower segments or smaller ones flat

14987 Lvs. unequal lob · upper lobes round ov nearly ent., lower and stip ligulate quite entire, Fruit lateral
14988 Lvs. unequal 2-lobed spinul-toothed upper lobes roundish ov, lower ligul Stip obl quad spiny toothed
14989 Leaves very convex unequally 2 lobed lobes and lobules ovate bipart. fringed with long and slender ciliæ
14990 Stem procumbent bitripinnate, Leaves very convex unequally 2-lobed upper lobes 2-parted spiny toothed, lower very minute oblong entire
14991 Leaves nearly flat unequally 2-lobed cut into numerous capillary segments upper lobes 2-partite, lower minute, Stipules subquadrate laciniate

b Lower segments or smaller ones involute

14992 Stem creeping unequally branched, Leaves unequally 2-lobed upper lobes rounded, lower minute involute Stipules large rounded obcordate

and Miscellaneous Particulars.

species have been admirably illustrated by Hooker, to whose Monograph no other botanical work can be compared.

History, Use, Propagation, Culture,

2254 *Marchantia* Named by Nicholas Marchant, in honor of his father John Marchant, the first botanist whom the Academy of Sciences of Paris admitted among its members, in 1666 Soft-leaved creeping plants, with green cellular fleshy fronds spreading over the surface of the ground in wet places M hemisphærica and polymorpha are often the pest of the florist, whose flower pots are overrun by them, and continually disfigured

2255 *Riccia* Pietro Francisco Ricci, was a Florentine botanist, who left some of his works to the academy of Florence Little, generally floating, simple plants, of the nature of which very little is known Only one kind has been observed in fructification, and that is of a very ambiguous character. The thecæ, or the organs so called, are little round bodies immersed in a cavity of the frond, and containing minute sporules

2256 *Anthoceros* From ἄνθος, a flower, and κέρας, a horn, on account of the horn-like form of the theca, which old botanists considered to be the flower Minute frondose plants, with a linear 2-valved theca, containing a columella to which the sporules are attached. In habit they resemble Jungermannia.

14993 Lvs. unequal, 2-lobed upper lobes rounded; lower minute invol Stip roundish acutely bifid, Fruit lateral
14994 Lvs unequally 2-lobed upper lobes ovate-acum mostly curved at extremity, lower ovate acutely bifid
14995 Stem creeping unequally branched, Leaves unequally 2-lobed upper lobes hemispherical, lower minute almost obsolete, Stipules ovate rounded bifid, Fruit lateral
14996 Stem creeping branched, Leaves unequally 2-lobed: upper lobes larger calyptriform, lower bluntly square circumvolute, Fruit lateral

c Lower segments or smaller ones saccate

14997 Stem creeping branched, Leaves unequally 2-lobed upper lobes ovate spiny-serrated: lower minute saccate generally 1-toothed at base, Fruit lateral
14998 Lvs unequally 2-lobed: upper lobes ovate rounded, lower rounded saccate, Stip rounded flat emarginate
14999 Lvs. unequally 2-lobed. upper lobes ovate roundish, lower minute obov. saccate, Stip subquadrate emarg.

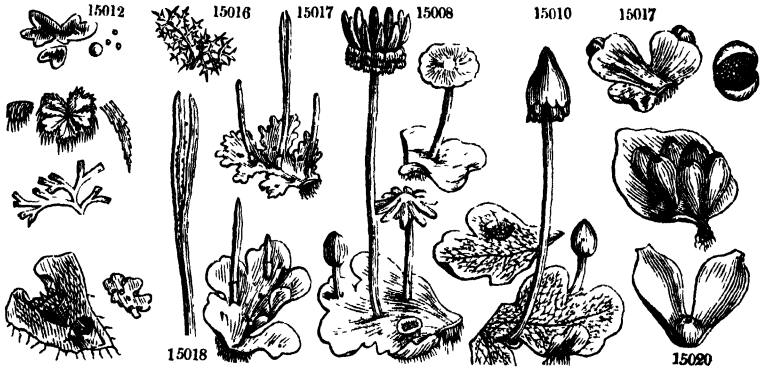
§ 2 Frondose

† Nerveless

15000 Frond obl decumb nervl fleshy nearly plane above swell ben; irregularly branch. The margin sinuated
15001 Frond lin nerveless fleshy compressed branched in a pinnated manner, Fruit marginal, Cal very short

†† Nerved

15002 Frond obl submemb dichot costate having scattered scales on the underside, Cal and calyptra within frond
15003 Frond obl submembranous irregularly divided obsoletely ribbed the margin entire or lobed and sinuated, Fruit from upper part of frond near the apex
15004 Frond lin dichotomous membranous costate glabr above more or less hairy beneath and on the margin, Fruit from the lower surface of the nerve
15005 Frond lin dichotomous membranous costate pubescent in every part [of the fronds
15006 Frond obl somew branch memb costate the margin nearly entire, Fruit arising from the superior surface
15007 Frond obl dichotomous membranous costate with the margin entire, Fruit arising from the upper surface of the frond



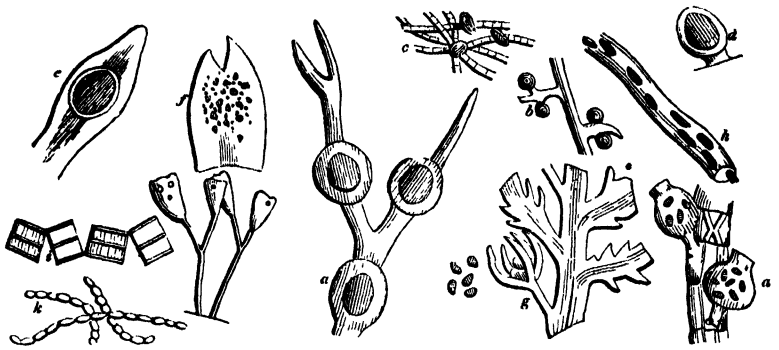
15008 Recept. of theca deeply cut in a stellated manner into about ten narr segm that of the anthers pedunculat.
15009 Recept of thecæ hemispherical cloven into about 3 oval segments
15010 Recept of thecæ entire conical ovate somewhat angular that of the anthers sessile
15011 Recept of thecæ hemispherical half 4-cleft of 4 cells

15012 Frond small obl somew divid the segments 2-lobed at the end fleshy glaucous dotted on the surface
15013 Frond triangular cordate covered with long linear lanceolate segments on one side
15014 Frond membranous dichotomous, Lobes retuse
15015 Fronds membranous lobed pellucid, Theca beneath the sinuses of the lobes solit exserted turbinate tooth.

15016 Fronds bipinnatifid linear
15017 Fronds multifid lobed sinuated, Theca subulate half bifid
15018 Fronds lobed rounded flat, Theca short

15019 Frond flat imbricated lobed, Lobes rounded retuse

15020 Frond simple ovate, Thecæ pyriform clustered at the base of frond



and Miscellaneous Particulars.

2257 *Targionia* So called in remembrance of John Anthony Targioni, a meritorious Florentine botanist, who published in 1754 a work for the purpose of shewing the importance of botanical lectures, with reference to a course of studies in medicine There was also another Florentine physician called John Targioni Tozzetti, after whom Tozzettia has been named. This genus consists of only one species, which is frondose and lobed. The theca is concealed and almost sessile within the involucre, globose, bursting at the apex, and discharging its sporules mixed with spiral filaments This genus is very near Jungermannia

2258 *Sphærocarpus* From σφαῖρα, a globe, and καρπός, fruit, in allusion to the form of the fruit. The plant consists of a roundish delicate membranous frond, bearing on its disk a cluster of obpyriform receptacles, each of which has a globose transparent finely membranous seed-vessel, filled with minute sporules unmixed with elastic filaments.

Order 7. ALGÆ.

Reproductive organs of two kinds 1 *Theeæ or tubercles variously situated.* 2 *Sporules or granules naked or immersed in the frond Plants always aquatic and submersed*

This order is constituted of the sea-weeds of our ocean, and of the floating scum-like substances of our ditches and rivers Little is known of the functions which what are called their reproductive organs perform The nature and structure of those organs are so various as to render it improbable that they should all be destined for the same purposes The bodies which are called sporules are variously situated, now filling distinct theeæ (*a*), or even tubercles (*b*), which are either free (*b, c, d*), or imbedded in the substance of the frond (*e, f*), now appearing to be naked and surrounded by an involucre (*g*), now scattered or arranged in some determinate manner in the interior of the frond (*h*) The fronds are either cylindrical (*h*), or plane (*i*), sometimes little more more than a mere membrane, sometimes hard and horny, and extended to the length of many feet Many are articulated (*i, k*) their line of separation is then called a joint, and the space between two joints an articulation

Professor Agardh, of Lund, one of the most celebrated of modern cryptogamists, and whose disposition of Algæ is adopted here, in his latest work, called Systema Algarum, published at Lund, in 1824, defines the order thus

"Aquatic plants destitute of cotyledons and of sexual organs, gelatinous, membranous, or coriaceous, filamentous, laminose, or even leafy, in color green, purple, or olivaceous, jointed or continuous, bearing sporidia" (little transparent bodies containing sporules), "either included in pericarps or scattered over the surface"

The Algæ form one of the three forms of the lowest order of vegetation, Lichens and Fungi the two other Of the former, many are considered by some botanists to be animalcula, and others, to be the young seedling plants of mosses

Tribe I DIATOMEÆ

Bodies of various forms, flat and crystalline, and separating into fragments.

2259 *Achnanthes* Frond stalked, vexilliform *Marine*
2260 *Diatoma* Filaments jointed, hyaline, rigid, simple, united in pairs longitudinally, at length separating into articulations cohering by their alternate angles
2261 *Fragillaria.* Filaments jointed, simple, gelatinous, compressed, fragile, separating at the joints.
2262 *Meloseira* Filaments jointed, contracted at the joints, very fragile, and easily separating.
2263 *Desmidium* Filaments transversely and densely striated, mucous, flexible, green, half separated into articulations, and in that state pinnatifid.
2264 *Schizonæma.* Filaments bead-like, composed of narrower cohering filaments inclosing elliptical granules, into which they are finally dissolved *Marine*

Tribe II NOSTOCHINÆ.

Individuals numerous, globular or filiform, suspended in a gelatine of a definite form.

2265 *Palmella.* Minute or small, somewhat diaphanous gelatinous plants, filled with solitary granules unmixed with filaments
2266 *Echinella* A roundish gelatine crammed with elliptical radiant corpuscles. *Marshy*
2267 *Alcyonidium* A spongy fleshy lobed frond filled with granules *Marine*
2268 *Nostoc* Plants roundish or shapeless, gelatinous Substance composed of curved moniliform simple filaments, lying irregularly in a gelatinous nidus.
2269 *Coryncphora* A gelatinous roundish puckered frond filled with jointed filaments, bearing here and there clavate processes
2270 *Rivularia* A gelatinous subglobose frond filled with filaments, radiating from a common centre, continuous, placed on a globule, and marked with annulations inside
2271 *Chætophora* Plant elongated or globose gelatinous Substance composed of branched articulated filaments
2272 *Scythymenia* A coriaceous tough stratum, formed of fibres and granules mingled together.

Tribe III CONFERVOIDEÆ

Filaments jointed either externally or internally, separate, and not combined in any definite form.

2273 *Byssocladium* Filaments like cobwebs, scattered externally with sporidia *Slightly inundated*
2274 *Mycinema* Filaments membranous, opaque, tenacious, colored (usually tawny). *Slightly inundated*
2275 *Chroolepus* Filaments rigid, nearly solid, opaque, crumbling into powder, torulose *On rocks or bark*
2276 *Trentepohlia* Filaments flexible, colored, bearing capsules, which generally proceed from the last articulation, which is inflated *Inundated or fluviatile*
2277 *Scytonema* Plant not gelatinous, coriaceous Filaments short, forming dark dense tufts, beaded internally, or filled with annular transverse bodies *On rocks or inundated, rarely marine*
2278 *Stigonema* Filaments continuous, coriaceous, naked, marked inside with dots disposed in rings *On rocks*
2279. *Protonema.* Filaments somewhat jointed, rooting very minute
2280 *Hygrocrocis* Filaments hyaline, arachnoid, obsoletely articulated, floating in a shapeless gelatine or in a colored membrane
2281 *Leptomitus.* Filaments hyaline or slightly colored, arachnoid, obsoletely articulated, separate, erect, not entangled.

2282 *Mesoglœa.* Frond filiform, cylindrical, gelatinous, with compact somewhat moniliform branches radiating from a medullary pith, and bearing capsules.
2283 *Batrachospermum* Frond filiform, gelatinous, sending out from the primary filament moniliform gemmiferous branches
2284 *Draparnaldia.* Filaments green, jointed, very gelatinous. Ramuli penicillate fascicled Fructification a granular mass in the articulations of the main filaments.
2285 *Oscillatoria* Plants gelatinous Filaments simple, continuous, membranaceous, filled internally with transverse parallel striæ
2286. *Calothrix* Filaments destitute of a mucous matrix, stiffish, straight, motionless, with a continuous tube annulated inside
2287 *Lyngbya.* Filaments without a mucous matrix, freely floating, flexible, motionless, with a continuous tube annulated inside
2288 *Bangia* Filaments capillary, mostly simple, tubular, continuous. Fructification, granules disposed in regular transverse series or strata
2289 *Zygnema* Filaments jointed, simple, gelatinous, compressed, fragile, separating at the joints
2290 *Mougeotia* Filaments articulated, connected like a net, with irregularly placed granules, and theca attached to the angles of the meshes
2291 *Hydrodictyon* Filaments articulated, connected like a net Articulations viviparous, including young individuals
2292 *Conferva* Filaments uniform, jointed, membranaceous, simple or branched, mostly green Fructification, granules scattered in the articulations *Salt and fresh water*
2293. *Bulbochæte* First filament articulated, sending out from the apex of the articulations an accessory branchlet Thecæ alternating with the accessory branches *Marshy*
2294 *Nitella* Filaments consisting of a single tube, membranous, jointed, with whorled branches Organs of fructification twofold and separate, first nucules spirally striated, without bractes, and not crowned, second, colored globules *Sea and marshes*
2295 *Chara.* Filaments spirally striated, jointed, with whorled branches Organs of fructification twofold, and close together, first, nucules spirally striated, furnished with bracteæ, and crowned, second, colored globules *Sea and marshes*
2296. *Ceramium* Filaments jointed, subdichotomous, red, articulations veined or diaphanous Fructification, capsules with an involucre of short ramuli *Marine*
2297 *Griffithsia* Filaments jointed, rose red, branched Articulations marked with one broad tube-like line, the joints pellucid Fructification, pedunculated capsules on the ramuli *Marine*
2298 *Chætospora* Filaments obsoletely articulated, rosy, covered by axillary articulated fruit-bearing branches, which either include in the middle a globe of sporules, or change to a lanceolate receptacle covered with setæ, among which the sporules nestle *Marine*
2299 *Polysiphonia* Filaments jointed, longitudinally striated, with internal parallel tubes. Fructification, double ovate capsules, and granules in swollen branchlets *Marine*
2300 *Rytiphlœa* Frond flattened, distichous, transversely striated, becoming black when dry, with incurved ramenta Fruit twofold, first, spherical capsules with pyriform sporidia, and second, lanceolate pods with roundish sporidia *Marine*
2301 *Ectocarpus* Filaments jointed, much branched, fuscous. Fructification, lanceolate pods or ovate capsules solitary or racemose *Marine*
2302 *Sphacellaria* Filaments jointed, branched, olivaceous, distichous or dichotomous, apex of the branches sphacellate or hyaline, abrupt Fructification, granules in the sphacellated apex, or capsules *Marine*
2303 *Cladostephus* Plant olivaceous Main filaments opake, inarticulate, branches jointed, mostly whorled with ramuli Fructification, capsules *Marine*

TRIBE IV ULVACEÆ.

Frond membranous, continuous, tubular or flattened, never ribbed, herbaceous, or very rarely purple. Fruit a heap of sporules, either naked, or forming scattered granules covered by conocystas

2304 *Vaucheria* Filaments dichotomous or irregularly branched, somewhat rigid Fructification, a granulated mass within the frond, and external dark vesicles variously situated
2305 *Codium* Frond spongy, of a determinate figure formed of filaments densely packed, which are tubular and continuous, and colored by a granular green powder Conocystas clustered at the surface of the frond
2306 *Bryopsis* Root minutely scutate Filaments tubular, continuous, aggregated, branched, pinnate, or imbricated upwards with branchlets Fructification a dark internal granular mass.
2307 *Solenia* Frond tubular, membranous, with a striated areolated surface Sporidia very minute and compact
2308. *Ulva* Root scutate Frond plane, ribless, flabelliform or wedge-shaped, or linear and dichotomous Fructification naked immersed, granules distributed in fours throughout the frond
2309 *Porphyra* Frond flat, purple, with the membrane of equal texture Fruit twofold, first, sori of oval sporidia collected in a disorderly manner, second, two parallel lines marked on each side by a globule

TRIBE V FLORIDEÆ

Frond cortaceous or rarely membranous, flat or filiform, continuous, purple or pink Sporidia purple, included in capsules or clustered in sori

2310 *Polyides.* Frond filiform, fastigiate, cartilaginous, softish, composed of radiating fibres Fruit, spongy warts composed of fibres supporting sporidia
2311 *Ptilota* Root scutate Fronds compressed or plane, pinnate Fructification; a cluster of naked granules surrounded by a linear cleft involucre
2312 *Rhodomela* Frond either flat or foliaceous, and somewhat ribbed or filiform Fruit twofold, first, lomenta filled longitudinally with globules of sporaceous matter, second, capsules with a few pyriform sporidia sessile in the capsule (blackish when dry)
2313 *Chondria* Frond continuous, gelatinoso-cartilaginous Fructification double, naked granules immersed in the substance of the ramuli and external tubercles
2314 *Sphærococcus* Root scutate Frond submembranaceous or cartilaginous. Fructification uniform, tubercles or capsules
2315 *Halymenia.* Frond flat or tubular, somewhat membranous. Fruit, dot-like tubercles half immersed in the lamina of the frond
2316 *Bonnemaisonia* Frond filiform, compressed, pectinate, ciliated Fruit, capsules with pyriform sporidia fastened together in a chain-like manner
2317 *Delesseria* Root scutate Frond plane, membranaceous, with or without ribs. Fructification double, tubercles and clusters of naked immersed granules

TRIBE VI. FUCOIDEÆ.

Frond coriaceous, rarely membranous, continuous, olive-green, flat or filiform Sporidia black, included in capsules, which are either ovate, and surrounded by a hyaline border, and nestling in a peculiar receptacle, or pyriform, and immersed in the frond

2318 *Lemanea* Frond filiform, torulose, tubular Chains of sporæ adhering to the inner surface of the filament, pencilled moniliform. *In fresh water.*

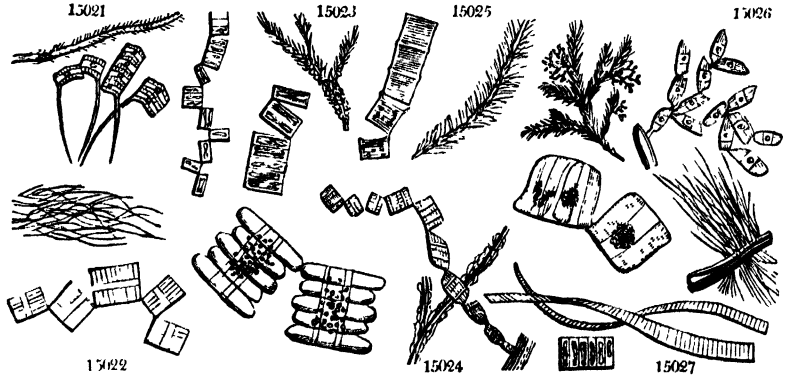
2319. *Chordaria* Root scutate. Frond filiform of an olive color and cartilaginous substance. Fructification, clavate, pyriform, concentric filaments constituting the whole frond

2320 *Scytosiphon* Root scutate Frond filiform, tubular, subcoriaceous Fructification; naked pyriform granules covering the whole frond

2321 *Sporochnus* Root mostly scutate Frond plane, with distichous branches, bearing, in most instances, delicate pencil-like deciduous tufts of confervoid filaments. ("Receptacles composed of concentric, clavate, articulated corpuscules")

2322 *Halicera* Frond flat, linear, ribbed, membranous Capsules heaped in sori

2323 *Encælium* Frond tubular or bladdery, dotted Fruit, the tips of the frond filled with a black sporaceous matter



2324. *Zonaria.* Root downy Frond plane, ribless, flabelliform or wedge-shaped, or linear and dichotomous. Fructification, adnate tubercles collected into parallel lines on the frond.

History, Use, Propagation, Culture,

2229 *Achnanthes* From αχνη, the froth of the ocean, and ανθος, a flower Marine productions, separating into fragments, but by degrees. In the middle of each articulation are one or two crystalline points.

2230 *Diatoma* From διατομη, incision, in allusion to the curious manner in which the filaments are divided into joints cohering alternately by their angles

2231. *Fragillaria* So named on account of their fragile nature, which is more remarkable than that of other Conferve The filaments when complete are flat and composed of little fragments glued together crosswise. These are very narrow, and when once separated do not cohere again

2232 *Meloseira* From μηλος, a membrane, and σειρα, a chain, with reference to the form of the filaments This genus differs from the last, as Conferva from Oscillatoria

2263 *Desmidium* From δεσμος, a bond, in allusion to the singular manner in which the parts cohere when in a state of dissolution At that period the articulations become half separated one from the other in such a way as to represent a pinnatifid appearance

2264 *Schizonema* From σχιζω, to divide, and νημα, a filament; the filaments are finally divided into compound granules. These plants have entirely the habit and flexible substance of Confervæ When fresh they are sparkling and brown, when dry olive-green, and very shining They are composed of many filiform individuals, which include nearly the same corpuscles as are visible in the foreign genera Frustulia and Meridion.

2225. *Laminaria.* Root fibrous. Stipes dilated into a plane frond. Fructification, naked granules immersed and forming irregular groups in the frond.
2226. *Lichina.* Fronds minute, tufted, greenish-black when growing. Fructification solitary tubercles with a pore, at length scutelliform
2227 *Furcellaria* Frond cylindrical Fructification concealed in the swollen extremities of the frond, capsules in the centre, and pyriforme granules in the circumference.
2228. *Fucus* Root scutate Frond plane or compressed, (rarely filiform) dichotomous Fructification, tubercles contained in a common mucose receptacle, and filled with sporules and filaments
2229 *Cystoseira.* Root scutate Stipes cylindrical Lower leaves plane, upper ones filiform, furnished with pinnate vesicles. Fructification, tubercles in common receptacles, the receptacles with several loculaments

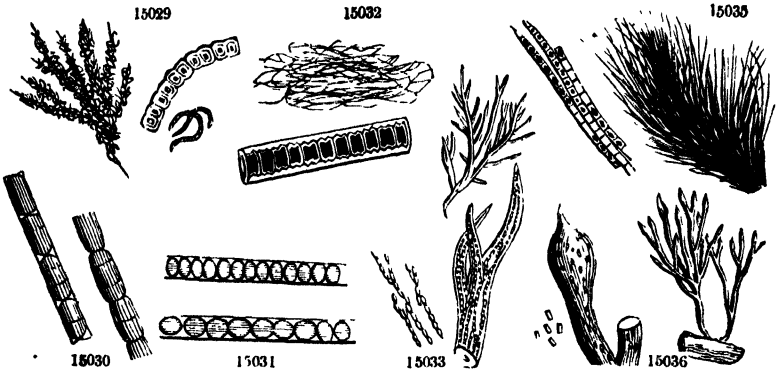
---

DIATOMEÆ.

15021 Articulations with one dot, Stem long

15022 Filaments striated, Articulations nearly equal in diameter with parallel striæ
15023 Articulations half as long again as wide granular transversely
15024 Filaments greenish, Articulations square striated
15025 Filaments arcuate transversely striated, Articulations nearly square with pellucid joints
15026 Articulations half as long again as wide oblique marked with a pellucid transverse band and a dot

15027 Filaments tapering very rigid with parallel transverse dense striæ
15028 Filaments tapering orange-colored, Articulations twice as short as their diameter



15029 Filaments unequal containing nearly circular moniliform globules in rows
15030 Joints contract Articulations transversely striat with 1 or 2 very fine lines about 3 times as long as wide
15031 Articulations shorter than broad finally changed into somewhat oval close moniliform heaps

15032 Filaments after copulation punctatifid traversed by a longitudinal green streak, Articulations 2-toothed

15033 Filaments somewhat branched cæspitose acute, Granules parallel clustered
15034 Filam somew branched cæspitose acute, Granules clustered appressed, Membrane of filam inconspicuous
15035 Filaments densely branched virgate, Granules elliptical

15037 Filaments slender erect dichotomous, Branches swollen here and there into roundish knobs · interior gelatinous with numerous cylindrical oblong granules

NOSTOCHINÆ.

15038 Frond thick angular-lobed, Granules elliptical
15039 Fronds aggregate minute globose, Granules globose
15040 Frond deformed rugose, Granules globose brown

and Miscellaneous Particulars

2265 *Palmella* Apparently a diminutive of *Palma*, a little palm; but the application of the name is not obvious in that sense The plants are found in marshy or inundated places, and consist of globules nestling in a gelatine, in which respect the genus differs from Protococcus, the Red Snow plant. It is supposed that many of the species are only the ova of animalcules.

The Red Snow plant, which, as we have just said, is nearly related to this genus, has not hitherto been noticed in this country, but as it has been found in many countries similar to our own regions of snow, it is so probable that it exists in Great Britain, that we insert some particulars of it here, especially as it may be considered to have been *introduced* at least in 1819, by Captain Ross's expedition to the North Pole. When viewed under the highest powers of a simple microscope, it appears to consist of globules containing a red fluid. We select the following observations upon its history, from a communication made to the News of Literature and Science, on the twenty-first of January, 1826

"Our scientific readers will remember the interest which was excited on the subject of this natural production, upon the return of Captain Ross from his Polar expedition, some years since At that time it was examined by three of the most acute observers in this country, especially of microscopical objects, Wollaston, Brown, and Bauer, who all formed a similar conclusion in one respect, that it was of vegetable origin, but were of different opinions as to its precise nature · Dr. Wollaston supposing it to be the seed of a moss, Mr Brown, a substance belonging to Algæ, and nearly related to Tremella cruenta, a common British plant, and Mr.

History, Use, Propagation, Culture,

Bauer refering it to a genus of Fungi, called Uredo We have lately seen a curious paper upon this subject, by Professor Agardh, of Lund, whose opinions upon all matters connected with the lower orders of vegetation demand deep attention

"That snow occasionally assumed a red color, had long been a fact of which there could be no doubt, and that water was also under particular circumstances stained with red, we have the popular traditions of showers of blood, and water changed to blood, to attest In the year 1608, a shower of blood fell near Aix, in France, which was examined by Peirese, and found to be caused by insects, and to the same cause was undoubtedly to be ascribed the bloody rain that fell at Schonen, in 1711, which the learned Bishop Swedberg looked upon as a supernatural phenomenon, and a direct sign of the anger of the Divinity The red pools which are occasionally met with, even in this country, are generally stained by the presence of an immense number of animalcules, called Daphnia Pulex, or Cyclope quadricornis The red stains sometimes seen upon the seashore are occasioned by a particular sort of Fucus Professor Agardh proceeds to observe, that the red snow is very common in all the alpine districts of Europe, where it is probably, for the most part, of the same nature as that brought from the North Pole by Captain Ross Saussure saw it in abundance upon Mount Brevern, in Switzerland, and elsewhere, Ramond found it on the Pyrenees, and Sommerfeldt in Norway In March, 1808, the whole country about Cadore, Belluno, and Feltri, was in a single night covered to the depth of twenty centimetres with a rose-colored snow, at the same time a similar shower was witnessed on the mountains of Valtelin, Brescia, Carinthia, and Tyrol But the most remarkable red-snow shower was that which fell on the night between the 14th and 15th of March, 1813, in Calabria Abruzzo, in Tuscany, and at Bologna, and upon the whole chain of the Appennines We may add, that both snow and ice were seen stained with red, green, and blue by the late expedition under Baron Wrangel to the Frozen Ocean

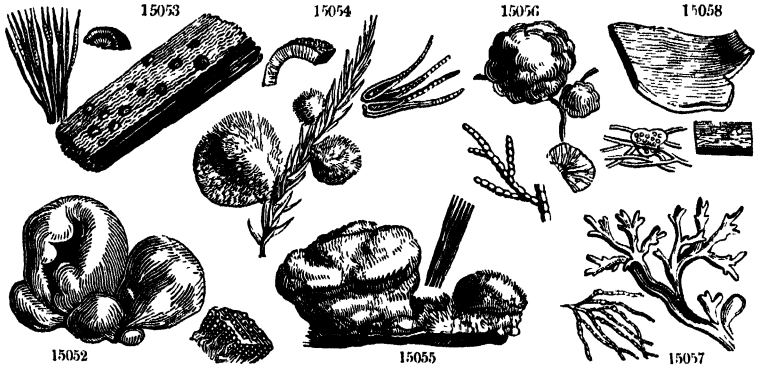
"With this information before him, Professor Agardh proceeds to consider the nature of this remarkable substance, which he concludes, with Brown, to be referable to the lowest order of Algæ, and to stand as a distinct genus, which he calls Protococcus, upon the very limits of the animal and vegetable kingdoms Saussure, indeed, from finding that the red snow of the Alps gave out, when burnt, a smell like that of plants, concluded that it was of vegetable origin; but he supposed it to consist of the farina of some plant, although he could neither account for its having ascended to such elevated regions, nor mention a plant whose farina was of that color

"Besides the plant called Palmella cruenta, which is similar in its structure to the red-snow plant, other low vegetable productions have been noticed by different authors, as possessing a similar color Such are the Lepraria Kermesina, which, by the way, is considered only a particular state of the red-snow plant itself, and the Byssus cobaltiginea. These are always found in situations in which they are exposed to the intense action of light, such as vast plains of snow, or masses of glittering limestone Whence it is inferred, that the color of the red snow is attributable to the action of light, modified in some mysterious manner, by the nature of the body on which it strikes In confirmation of which hypothesis, it is remarked, that when the Lepraria

15041 Minute roundish soft rose-colored containing extremely minute sporules
15042 Frond deformed rugose, Granules ovate red
15043 Frond crust-like crimson

15044 Corpuscles radiant lanceolate jointed

15045 Branches elongated
15046 Branches short obtuse
15047 Frond filiform simple



15048 Frond expanded deformed plaited wavy
15049 Frond globose watery inside, Integument coriaceous very smooth
15050 Frond globose solid smooth
15051 Frond bladdery subcoriaceous hollow plaited smooth

15052 The only species

15053 Frond hemispherical hard, Filaments very dense branched by apposition
15054 Frond globose hollow, Filaments simple
15055 Filaments intermingled with calcareous particles hard and crustaceous when dry

15056 Frond tubercular hollow, Filaments distributed in many little orbs
15057 Frond linear flattish dichotomous at base much pinnated at end
β Branches very short

15058 The only species

and Miscellaneous Particulars

Kermesina is found under stems, stones, or in crevices of limestone, where light can scarcely gain admittance, its color gradually passes from red to green

" The only difficulty in the way of this explanation of its nature is in the statements of so many observers, that the red snow falls from the air But Professor Agardh shrewdly remarks, that all the persons agree that it fell in the night, *which is as much as to say, that no one saw it fall* He is of opinion that the Protococcus, or Red Snow, is called into existence by the vivifying power of the sun's light, after its warmth has caused the snow to dissolve, and accompanied by that incomprehensible power in white snow, of producing a color, and, moreover, that it first attracts the eye when there is a considerable quantity, in the same way that we do not see the color of drops of water till they have accumulated in the ocean "

2266. *Echinella* From *echinus*, an hedgehog, in allusion to the bristly appearance presented by its radiant particles Many naturalists believe the bodies referred to this genus to be animalcula

2267 *Alcyonidium* So called, from αλκυονιδιον, the foam of the sea, among which the plants referred to this genus are naturally produced. This also is supposed to be the nidus of animalcula Lamouroux who originally fixed it here, afterwards referred it to Zoophytes, in which last opinion Gaillon agrees with him, declaring that he has actually seen the animalcula nestling in it D'Orbigny and Ellis consider it the ova of a testaceous animal

2268 *Nostoc* A name first used by Paracelsus, without an explanation of its meaning Agardh thinks this singular substance changes into the genus Collema among the Lichens.

2269 *Corynephora* From κορυνη, a club, and φερω, to bear, in allusion to the clavate filaments which are found on different parts of it The species are found in the ocean."

2270. *Ruvularia* So named on account of the places in which the species grow. They have a globose frond, of a gelatinous but toughish texture Their color is dark-green, and not as in the next genus, pale-green The filaments are very singular, seated on a globule, simple, cylindrical, and terminated by a very fine point, they are densely compact, continuous, and filled with a green annular matter

2271. *Chætophora.* From χαιτη, a bristle, and φερω, to bear, the filaments are terminated by a bristle-like point This genus is chiefly distinguished from Conferveideæ by its gelatine The color is bright green, and the texture softer than in the preceding The manner of propagation, which has been noticed in so small a number of Algæ, has been observed by Agardh in two species of this genus. In Chætophora pisiformis little hard crystalline corpuscles, like grains of sand, may be seen, which separate from the mother plant and produce young filaments But in C. clavata, the points of the filaments fall off and sink to the bottom of the water, where they unite by three, four, five, or by a greater number at a time, in a common point, which is first green, afterwards blackish, and apparently inorganic From this beginning new individuals arise

2272. *Scythymenia.* Derivation unknown A very singular plant, formerly referred to Ulva. It has the habit of a fungus, and grows upon damp walls. It is supposed to be most nearly related to Palmella.

History, Use, Propagation, Culture,

2273 *Byssocladium* From *byssus*, a kind of fungus, and *κλαδος*, a branch; the filamentous branches of this plant being very similar to those of Byssus These plants grow in places occasionally overflowed with water

2274. *Mycinema* From *μυκης*, a kind of minute fungus, and *νημα*, a thread, in allusion to the resemblance of the filaments to those of some Fungi

2275. *Chroolepus* So called on account of the change which is undergone by the exterior membrane which changes to powder, from *χροος*, skin, and *λεπω*, to decorticate

2276. *Trentepohlia* So named, in honor of an obscure German botanist This is an ill-defined genus, which is much in need of reformation

2277. *Scytonema* From *σκυτος*, leather, and *νημα*, a filament, in allusion to the coriaceous nature of the filamentous frond. The species grow chiefly on stones in inundated places, and are rarely found in salt water

CONFERVOIDEÆ.

15059 Filaments appressed very minute short radiant cobweb-like branched sinuous wavy

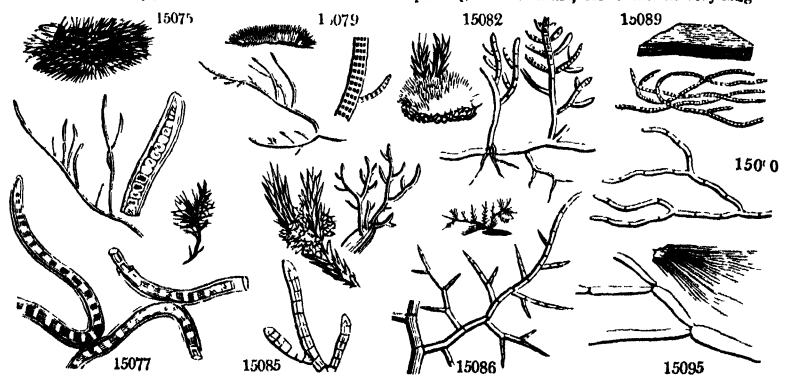
15060 Filam thin entangled in a cobweb-like membr Branches scatter rem simp Articulat of various lengths
15061 Filam decumb long membran equal branched entangled in a soft layer, Articulat thrice as long as broad
15062 Filaments much branched rigid erect entangled in a nearly solid mass, Articulat 4 times as long as broad
15063 Filam branch ascend. very short entangled in a dense unif crust, Articulat about ½ as long again as broad
15064 Filam. branch. dichotom. creeping very minute having caps at end and ærugin Dissepiments nearly obsol

15065 Filaments cæspitose erect very short dichotomous, Articulations half as long again as broad
15066 Filaments cæspitose branched short erect, Branches spreading stiffish, Articulations as broad as long
15067 Filaments erect fascicled alternately branched rigid, Articulations tumid as broad as long
15068 Filam cæspit rig short ascend curved densely branched, Artic as broad as long by a line except granules
15069 Filaments cæspitose branched erect rigid somewhat cartilaginous obtuse, Articulations as broad as long

15070 Filam dichotomous cæspitose entangled very minute, Artic about twice as long as broad
15071 Filam flexu collect in a dense soft cushion-like tuft, Branch long spread rig Artic twice as long as broad
β Much smaller, Articulations as broad as long
15072 Filaments virgate cæspitose, Branches straight, Artic twice as long as broad, Thecæ racemose

15073 Filaments decumbent rigid flexuose branched entangled in a crustaceous layer, Branches appressed
15074 Filaments simple erect very short flexuose-crisp entangled in a black layer
15075 Tuft with olive-yellow filaments, Branches double 1-sided

15076 Filaments simple erect flexuose spirally twisted into pointed masses greenish above brownish below
15077 Tuft loose, Filaments netted branched, Branches divaricating
15078 Tuft loose, Filaments flexuose, Branches solitary remote ascending



15079 Filaments rigid branched, Branches slender, Granules disposed in rings

15080 Runner creeping transparent emitting round green erect branches, Artic cylindrical, Joints obsolete
15081 Layer velvety, Filaments erect obtuse clustered brittle, Articulations gibbous
15082 Layer velvety, Runner creeping rooting sending out erect obtuse branches, Artic cylind Joints obsolete
15083 Layer velvety, Filaments erect blunt rigid, Branches alternate, Articulations oval twice as long as broad
15084 Filaments dichotomous, Branches divaricating acuminate, Artic thrice as long as broad
15085 Filaments olivaceous branched blunt erect in a cushion-like tuft, Artic about as broad as long
15086 Filaments branched, Branches alternate divaricating subulate, Artic three times as long as broad

15087 Tuft globose, Filaments very fine like cobweb hyaline much entangled without joints wavy branched
15088 Filam dichot branch very min decumb very densely entang in a whit. layer, Artic twice as long as broad
15089 Filam somewhat branched densely entangled in an olive-green pellicle, Artic as broad as long
15090 Filam dichot curved flexuose entangled in a coriaceous gelatin pellicle, Axillæ round, Artic very long
15091 Filam hyalin somew branch entang cobw-like entang in a pucker cloud-like membr or a comp gelatine
15092 Filam branched densely entangled in a gelatin pellicle, Branches divaric Artic half as long again as broad
15093 Filaments hyaline entangled branched, Branches tapered acute, Artic as long as broad

* *Growing on vegetables*

15094 Filam somew. branched minute hyaline, Branches scattered forked blunt-ish, Joints obsol Artic various
15095 Filam at every joint branched and clustered in a shapeless gelatinous mass, Articulations very long

and Miscellaneous Particulars.

2278. *Stigonema* So named in allusion to the regular annular dots of the filaments, from στιγων, dotted, and νημα, a thread This genus is similar in habit to the Lichens. The color is opaque and brown; the filaments are branched with spines, and marked internally with distinct dots.

2279 *Protonema* It is uncertain whether this genus is not rather the young state of germinating mosses, it is named in allusion to the simplicity of its structure, from πρωτος, first, or primary, and νημα, a thread

2280 *Hygrocrocis* From ὑγρος, any thing belonging to water, and κροκις, a little tuft. These plants are found in chemical solutions of vegetable matter, as in ink, &c.

2281 *Leptomitus* Substances floating in the water, and produced by animal matter in a state of decay They consist of exceedingly fine intertangled filaments, whence the name, λεπτος, slender, and μιτος, a thread.

History, Use, Propagation, Culture,

2282 *Mesogloia* From μεσος, the middle, and γλοιος, viscid. the spines of little branches radiating from a common centre, and forming what appears to be a solid mass These plants were formerly referred to Chætophora, from which they differ in the want of any fixed gelatine

2283 *Batrachospermum* From βατραχος, a frog, and σπερμα So called in allusion to the places in which the species grow, they are mostly found in marshes, less frequently in the sea

2284 *Draparnaldia* James Philip Ralph Draparnaud, was a French botanist, who wrote some memoirs on the subject of botany in the beginning of this century He is also known for his acquaintance with fresh-water Confervæ.

2285 *Oscillatoria* The singular motion of these curious plants has suggested their generic name The oscillation of the filaments seems almost of an animal nature, although it frequently arises from mechanical

15096 Filam. branched very minute, Branches and branchlets acuminate, Joints pellucid, Artic cylindrical

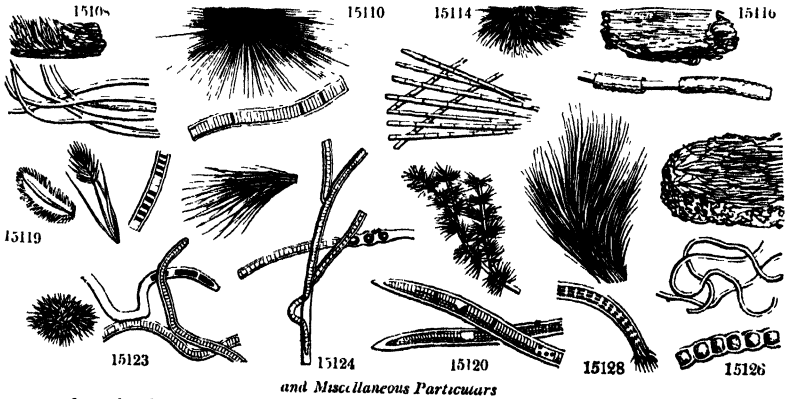
** *Growing on animals*

15097 Filaments simple hyaline clavate at end

15098 Frond dichotomous, Axillæ rounded upper spreading
15099 Frond virgate with all the branches divaricating
15100 Frond somewhat moniliform virgate filiform, Branches scattered obtuse spreading

15101 Frond much branched, Branchlets tapering at each end divaricating
15102 Frond yellowish-brown, Branches divaricating

15103 Frond dichotomous cylindrical equal, Branches thickened at end
β Frond setaceous minute
15104 Frond moniliform much-branched, Branches rather acute, Cauline whorls nearly distinct globose
α Filaments thick, Whorls of stem confluent those of the branches distinct
β Thinner bluish with distant whorls



15105 Branches simple clustered, First filament nearly homogeneous
15106 Pencils of branches lanceolate acute erect
15107 Pencils of branches ovate blunt spreading

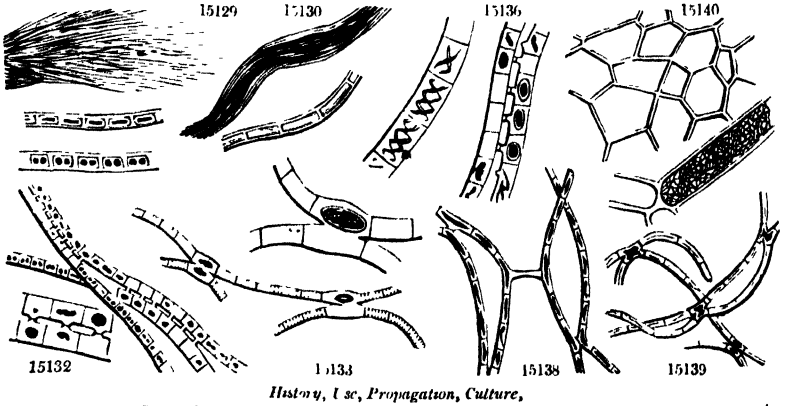
15108 Filaments hyaline very fine tufted entangled in nearly parallel lines
15109 Filaments rigid straight entangled in a gelatinous black layer which has short rays
β Filaments twisted in bundles
15110 Filaments rigid straight entangled in a gelatinous black layer with long rays
15111 Filaments stiffish curved entangled in a compact somewhat coriaceous layer
15112 Filaments transparent rigid straight entangled in a compact brownish-violet layer with short rays
15113 Filaments very minute densely entangled transverse striæ wholly invisible
15114 Filaments stiffish straight entangled in a gelatinous green layer with short rays
15115 Filaments rigid rapidly oscillating straight entangled in a gelatinous layer with long rays
15116 Filaments covered with a deciduous crust entangled in a blue layer
15117 Filaments very slender flexuose densely interwoven into thin masses
15118 Filaments very slender simple greenish lying in a thick very tender fragile ochraceous stratum

15119 Filaments very fine rigid snow-white packed in a dull-yellow tuft
15120 Filaments glaucous erect minute subulate fascicled at base separate at end
15121 Filaments curved-wavy erect minute entangled in a dense layer
15122 Filaments stiffish erect acuminate simple at the beginning finally branched
15123 Filaments curved variously united entangled in a lax globule
15124 Filaments mucous stiffish erect branched tufted
15125 Filaments stiffish erect branched packed in a dark-green tuft

15126 Filaments stiffish curved wavy thickish with lax rings

15127 Filaments tufted fastigiate equal, Bands approximating in pairs many-dotted
15128 Filaments dark-purple straight, Bands 5-dotted

and Miscellaneous Particulars



causes, as from the elasticity of the filaments, from the motion of minute animalcula Agardh, however, declares that O curviceps has naturally the motion of an animal, but of a creeping not oscillatory nature

2286 *Calothrix* From καλος, beautiful, and θριξ, hair, in allusion to the beauty of the entangled filaments; the latter appear as if branched, by the singular juxta-position of small filaments

2287 *Lyngbya* H C Lyngbye, a Danish botanist, is the author of an excellent work on Algæ, which he calls Hydrophytologiæ Danicæ Tentamen, published at Copenhagen, in 1819, in one volume quarto This genus differs from Oscillatoria in the absence of a mucous matrix, and from Calothrix in being curved and quite distinct In habit it approaches Conferva

2288 *Bangia* So called in honor of Christian Frederick Bang, the author of a dissertation upon the plants of sacred history, published in 1767

History, Use, Propagation, Culture,

2289 *Zygnema* From ζυγος, a yoke, and νημα, a filament, in reference to the singular manner in which the filaments are jointed together in pairs

2290 *Mougeotia.* Named in honor of J B Mougeot, the coadjutor of Nestler, in the publication of their useful work, the Stirpes Cryptogamæ Vogeso-Rhenanæ, which, we believe, is still continued.

* *Two dotted*

15129 Articulations twice as long as broad, Stellæ roundish, Fruit spherical
β Articulations thrice as long with two approximated stellæ in the middle
γ Articulations about as long as broad
15130 Articul 4 times as long as broad in fruit convolute, Sporaceous matter continuous obscure on each side
15131 Articulations about as broad as long, Stellæ transversely linear-oblong parallel, Rays obsolete
15132 Filam adnate, Articul half as long again as broad, Stellæ transversely oblong pectinated, Fruit spherical

** *Marked with spires*

15133 Filam equal curved and flexuose conjugate at angles and twice as long as broad, Spires simple
15134 Filam equal, Spires contracted in beginning, at length arcuate, Artic 3 times as long as broad
15135 Artic 4 times as long as broad in fruit elliptical, Spires cruciate lax, Crosses about 4, Fruit elliptical
15136 Articulations about as broad as long, Spires cruciate thin contracted, Fruit elliptical
15137 Filaments simple slippery very fine, Dissepiments obscure, Articulations shortish cylindrical

15138 Filaments knee-jointed, Articulations six times as long as broad
15139 Filaments purple-blue, Sporidia of the crosses of the filaments green

15140 Spots 5-cornered

A *Simple*

1. *Floating, arachnoid, colored.*

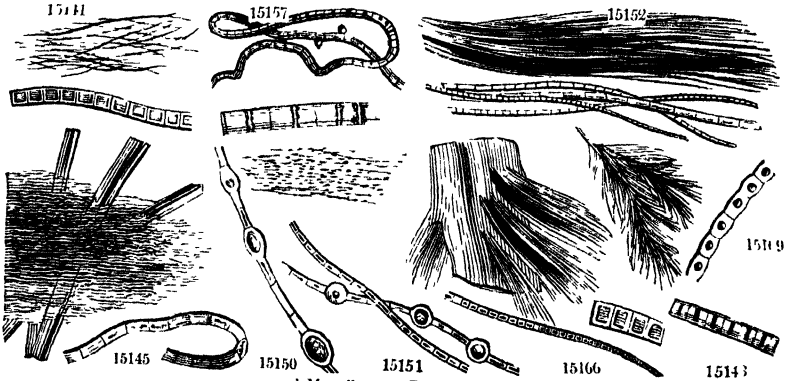
15141 Filaments simple creeping entangled in a brownish purple layer, Joints half as long again as broad
15142 Filaments simple very fine adnate straight brown, Articulations four times as long as broad
15143 Filam simple fine mucous, Articulations about as long as broad marked in the middle with a narrow band

2 *Floating, arachnoid, mucous, green*

15144 Filaments arachnoid simple very long in an uniform packed layer, Artic thrice as long as broad when young dotted in the middle
15145 Filam arachnoid simple very much entangled in a packed red layer, Artic about as long as broad or ½ as long again
15146 Filam simple mucous slippery capillary, when dry traversed by a longitudinal band, Artic as long as broad
15147 Filaments simple fine gelatinous tapered marked by a transverse band, Artic about as long as broad
15148 Filaments simple very fine gelatinous equal, Articulations twice as broad as long
15149 Filaments simple fine curled entangled smooth, Artic half as long again as broad

3 *Capillary or setaceous Articulations filled with globose granules, when dry alternately compressed*

15150 Filaments simple fine, Artic 5 times as long as broad inflated elliptical
15151 Filaments simple fine, Artic half as long again as broad with globular mutations at intervals



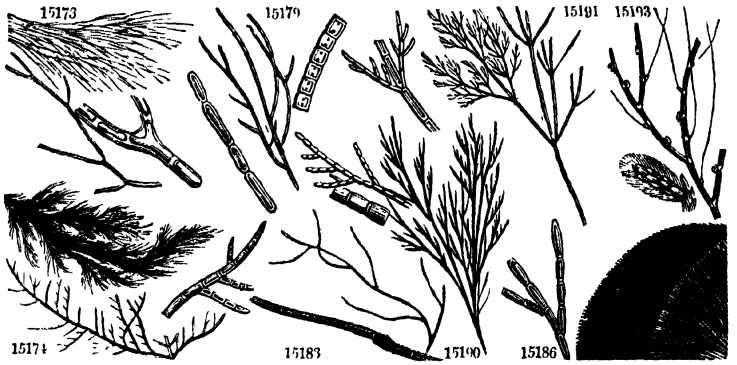
15152 Filam simp capill very long straight equal, Artic grain-bear 2 or 4 times as long as broad shin when dry
β Artic half as long again as broad
15155 Filam simple variously bent and loosely entangled, Artic about as long as broad, Granules scattered
15154 Filam simple filiform rigid crisp loosely entangled, when dry variegated, Artic turgid dotted
15155 Filam simple very short and minute entangled tortuous, Artic twice as long as broad
15156 Filam simple stiffish curled entangled fine, Artic 3 times as long as broad [moniliform
15157 Filam simple filif rigid crisp loosely entang when dry variegated, Artic about as long as broad, when dry
15158 Filam simple thicker than a bristle adnate straight rigid erect, Artic elliptical when dry
15159 Filam simple thicker than a bristle adnate rigid erect, Artic cylindrical 3 times as long as broad
15160 Filam simple very fine adnate stiffish curved, Artic about as long as broad somewhat moniliform
15161 Filam simple very fine adnate straight pendulous, Artic about as long as broad moniliform
15162 Filam simple fine adnate mucous, Artic as long as broad and variable, Interstices pellucid
15163 Filam simple very fine, Artic rather shorter than broad, Joints pellucid
15164 Filam simple very fine adnate mucous straight, Artic as long as broad, Interstices pellucid
15165 Filaments simple straight minute, Articulations oval half as long again as broad
15166 Filaments simple very fine adnate rigid tapered, Lower artic shorter than broad upper as long as broad

4 *Adnate, pencilled, fastigiate, colored*

15167 Filaments simple rigid fastigiate, Artic twice as long as broad
15168 Filaments simple fascicled rigid short attenuated at each end, Artic somewhat longer than broad
15169 Filam simple fine short, Artic torose about 3 times as long as broad, Sap contained in a central globule

B *Branched*

15170 Filam. branched flexuose short, Branches scattered spreading blunt, Artic half as long again as broad
15171 Filam branched densely tufted rigid short, Branches 1-sided, Artic generally thickest at the end about 3 times as long as broad



and Miscellaneous Particulars

2291 *Hydrodictyon* From ὕδωρ, water, and δίκτυον, a net, water-net, so named on account of its singular reticulated structure.

2292 *Conferva.* A syncope of the Latin *conferruminare*, to consolidate Plants of this kind were formerly

History, Use, Propagation, Culture,

held to be efficacious in healing fractured limbs Pliny declares, he was witness to a cure of this kind. Some of the species of this genus are believed to be merely the young of mosses.

2293 *Bulbochæte* From $\beta o\lambda\beta o\varsigma$, a club, and $\chi\alpha\iota\tau\eta$, a bristle, in reference to the bristly end of the primary filaments

2294 *Nitella* From *nitco*, to shine. A genus separated by Agardh from Chara, because the stem is composed of a simple tube, and not of one spirally striated. The plants have the habit of Chara

2295 *Chara* The origin of this word is unknown It first occurs in Cæsar's Commentaries, where it is mentioned as the name of a plant, the root of which was used by the Roman soldiers as food. That plant could have had no relation to the plant of the moderns Various opinions have been held with regard to the station of this genus Linnæus referred it to the perfect plants, and he has been followed by many botanists. Dr Hooker and Mr Lindley, in the former's Flora Scotica, formed it into a particular order, placed between Algæ and Hepaticæ, and with this opinion Dr Greville coincides But Professor Agardh thinks it cannot even be separated from true Algæ, in the midst of which he has placed it. The nature of the fructification is so paradoxical, that it is scarcely possible to trace an analogy between it and the fructification of any other plant.

15172 Filam. branched very minute equal parallelly exserted from an orbicular base
15173 Filam branched remotely capillary very long, Branches short divaricating, Artic. twice as long as broad
15174 Filam. branched capillary, Branches alternate those at the end clustered one-sided erect, Artic cylind. about twice as long as broad
15175 Filam. branch Branches altern rem. Artic. cylind 6-10 times as long as broad alternately compr when dry
15176 Filam branch. capill Branch divaricat. 1-sid upp. numer somew recurv. Artic. 4 times as long as broad
15177 Filam branched capillary. Branches spreading somewhat alternate, Artic. 3 times as long as broad
β Artic. elliptical proliferous, Pullulating filaments very fine

C *Heaped*

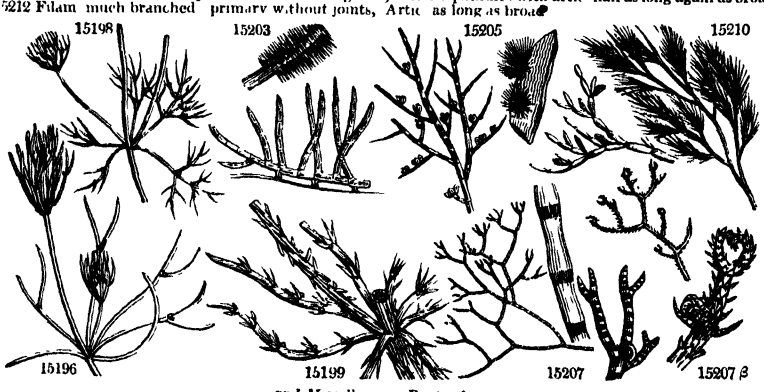
15178 Tufts fascic clav form. a hemisphere, Filam intric branch Branch ascend Artic about as long as broad
15179 Filaments tufted, Branchlets long remote, Artic oblong oval 3 times as long as broad
15180 Filaments much branch capillary, Branches spreading somew alternate, Artic 6 times as long as broad
15181 Filaments much branch capillary dichotom at base, trichotom in middle, Artic 5 times as long as broad
15182 Filam much branch capill Branches divaricat. somew recurv very numer Artic twice as long as broad
15183 Filam dichotom setac rigid finally becoming blackish, Branc erect rem Artic 3 times as long as broad
15184 Filaments opposite much branched, first branches blackish, second greenish [as broad
15185 Filam much bran setac when dry dot with black, Bran erect, Joints pelluc Artic cylind 3 times as long
15186 Filam from a common centre forming a globe rigid branched obtuse, Artic 5 times as long as broad
15187 Filam branch straight virg capil Branch erect somew hyal and thicken at end, Artic of various lengths
15188 Filam branched straight virgate capillary mucous, Branches erect when dry black at the ends
15189 Filam more than bristly trichotom shin when dry dott with black at joints, Artic 3 times as long as broad
15190 Filam much branch flexuose somew cartilaginous fragile, Branches and branchl scatter Artic torulose
15191 Filam much branched straight rigid, Branches generally in threes obtuse, Articul very long
15192 Filam. setac dichotom flexuose, Branch rem Branchl short blunt, Artic cylind 4 times as long as broad

15193 The only species

15194 Stem long, Branchlets blunt, Nucules nearly naked in heaps at the joints of the stem
15195 Stem trichotomous pellucid, Branchlets forked, Nucules axillary solitary
15196 Stem 2-3-chotomous opaque, Branchlets forked or with broken joints, Globules solitary
15197 Fruit branches filiform with other long jointed ones between, Nucules clustered axillary
15198 Stem slender long, Branches acute forked, Fruit solitary

15199 Stem twisted furrowed strigose, Strigæ reflexed, Bractes aculeate
15200 Stem twisted ash-colored, Branches not jointed, Bractes linear twin thrice as long as nucule

1 *Filaments short, fastigiate*



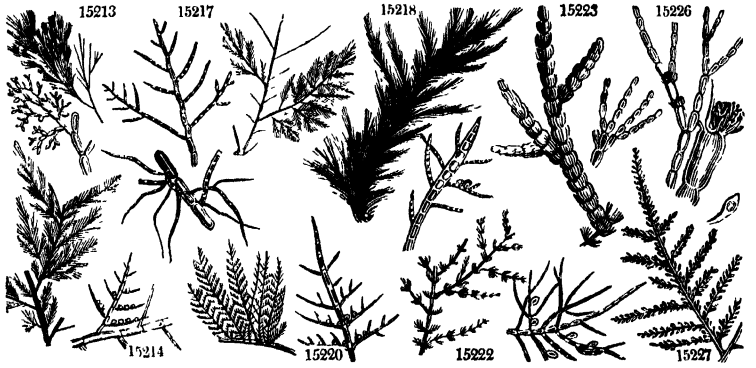
15201 Filam somew branch minute ferrug Branch scatter blunt, Artic pellue in mid 3 times as long as broad
15202 Filam branched fine tufted, Branches scattered simple remote, Articul 3 times as long as broad
15203 Filam creeping rooting densely entangl much branch Joints somew contract Artic narrowest in middle
15204 Filam creeping minute branched, Branches erect naked at base pinnat upw Artic twice as long as broad
15205 Filam much branch fastig short, Branc erect acute, Artic thrice as long as broad, Caps lateral clustered
15206 Filam short cæspitose pulvinate, Branches and branchlets fastigiate erect, Artic twice as long as broad

2 *Filaments dichotomous, Branchlets forked, Joints obscure, Theeæ involucred*

15207 Filam dichotom much branched somewhat membranous variegated with purple and hyal Joints elevated
β Joints hairy
15208 Filam dichotom much branched somewhat cartilaginous, Branchlets forked, Artic ovate opaque

3 *Branches furnished with branchlets, which are more or less dense and shortened.*

15209 Filam branched virgate, Primary articulations twice as long as broad
15210 Filam setaceous dichotomous, Artic thickened upwards about 5 times as long as broad
15211 Filam much branch prim thick and contiguous, Altern pinnules with artic half as long again as broad
15212 Filam much branched primary without joints, Artic as long as broad



and Miscellaneous Particulars

Greville observes, "This is a most curious tribe of plants, whose structure, I am convinced, is by no means well understood. At present, I have only minutely examined the fruit of C vulgaris Under a high power of the microscope, the globule is found to consist of seven triangular scales, which in maturity separate from each other, and produce the dehiscence of the globule. Each of these scales has a vacant portion in its centre, but the margin, which has a fluted appearance under a small magnifier, consists of a number of parallel, linear-oblong, hyaline, hollow tubes, placed at small intervals from each other, those forming the angles of the scale being branched Within these tubes are a profusion of orange, globular, minute bodies (exactly similar to the sporules of many cryptogamic plants), arranged in no order, and escaping on the least injury to the tubes. It is these little bodies which give the orange color to the globule Within the globule is a mass of elastic white filaments, much convoluted, and distinctly either jointed or transversely rugose"

The calcareous matter of the stem and branches is not an adventitious incrustation, but is the result of some peculiar economy in the plant itself, as it evidently originates from within, and is covered with the cuticle It is supposed to be analogous to the siliceous deposit beneath the cuticle of Equisetum

2296 *Ceramium* So called from κεραμος, a little measure, in reference to the appearance of the capsules. All the species are found in the sea, and among the substances cast up upon the shore.

History, Use, Propagation, Culture,

2297 *Griffithsia* Named after Mrs Griffiths, of Devonshire, whose many discoveries in marine vegetation truly entitle her to this distinction the highest which one botanist can bestow upon another

2298. *Chætospora* From χαιτη, a bristle, and σπορα, a sporule the latter are placed upon fine capillary divisions of the filaments

2299 *Polysiphonia* From πολυς, many, and σιφων, a siphon, in reference to the numerous little canals by which the colored matter is carried from one end of the plant to the other Agardh calls these plants

4 Branches pinnulate, Pinnulæ alternate

15213 Filam branch Branches virg. surround by short corymbose fastig branchl Artic 3 times as long as broad
15214 Filam branched, Branchlets alternate rigid spreading subulate, Artic 3 times as long as broad
15215 Filam branched, Branchlets scattered decompound-pinnate, Artic 3 times as long as broad
15216 Filam branched, Branchlets scattered virgate, Artic 8 times as long as broad
15217 Filam virgate with many simple or multifid pencilled ramuli, Artic 3 times as long as broad
15218 Primary filaments downy, Branches straight decompound pinnate, Artic 3 times as long as broad
15219 Filam much branch Artic. 4 times as long as broad by degrees becoming thickened, Caps. stalked ellipt.

5 Filaments pinnated, Pinnæ opposite.

15220 Filam pinnated, Pinnæ opposite nearly simple, Artic many times longer than broad
15221 Filam with irregular branches, having at each joint short slender opposite spreading recurved branchlets

1 Branches fascicled

15222 Filam branched, Branchlets subternate distant short multifid, Artic much longer than broad [broad
15223 Filam branch cover all over with somew whorl imbricate short multif branchl Artic much longer than

2 Dichotomous, chained.

15224 Filam dichotom straight, Branches erect long, Articulations cylindrical about 5 times as long as broad
15225 Filam dichotom Fibrils multifid very fine, Articulations thickened upwards about 5 times as long as broad
15226 Filaments dichotomous slippery, Articulations thickened 2-4 times as long as broad

15227 The only species

a Purple or scarlet, flat, somewhat pinnated

15228 Filaments bipinnate veiny rigid, Pinnæ and pinnules alternate, Articulations rather shorter than long
15229 Dark-red, Branches divaricate rigid, Articulations 3-tubed as long as broad Stem rough with tubercles
15230 Filam very much branch Primary not jointed, Branches decomp-pinn Pinnules heterogen multif fascic.

b Creeping, Branches divaricating, often one-sided

15231 Filaments entangled with scattered branches, Branches divaricating, Articulations twice as long as broad

c Purple, waxy-colored, adhering to paper

15232 Filaments nearly equal branched virgate, Branches erect, Lower articulations 5 times as long as broad

d Pencilled, black above, generally rose-colored above, adhering to paper

15233 Filam much branched diffuse, Branches virgate spread Lower artic obsol Artic much longer than broad

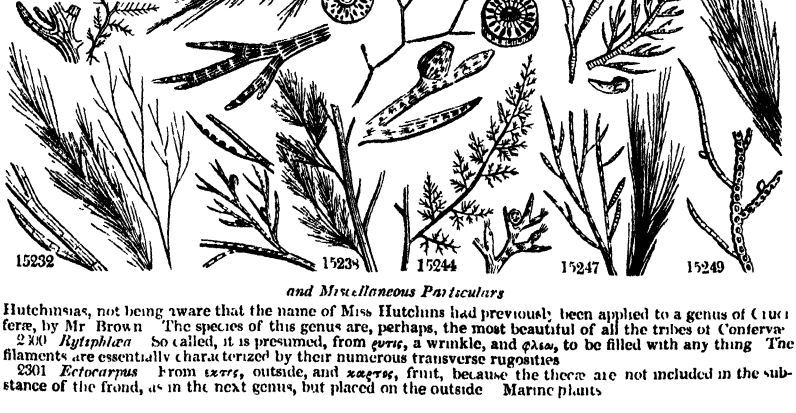
15234 Filaments much branched at end diffuse, Lower articulations very short when dry nodulose upper about as long as broad with 3 veins

β Filaments short somewhat pectinated, Branches nearly simple

15235 Filaments much branched diffuse, Branchlets spreading short, Articulations half as long again as broad
15236 Filam dichotom pencilled much branched, Articulations shorter than long netted veiny lower obsolete
15237 Filam much branched diffuse, Lower artic 5-veined 4 times as long as broad upp 3-veined twice as long
15238 First filament not jointed spirally veiny, Articulations as long as broad, Capsules axillary
15239 Filaments branched veiny, Branches long, Artic of stem long, of the branches thrice as short

e Black or blackish-brown when dry, rigid, scarcely adhering to paper

15240 Filam dichotomous nearly equal fastigiate Artic shorter than broad with a black point in the middle
15241 Filaments dichotomous irregularly branched at end, Branches and branchlets very straight upper artic 3 times as long as broad
15242 Filam much branched long diff Branchl short spread squarr recurved, Lower artic long upper short



f Branchlets lateral, short, fascicled

15243 Filaments decompound pinnated, Branchlets very short and fine, Articulations 3 times as long as broad
15244 Filaments branched virgate, Branch alternately pinnated, Branchlets short multifid, Theca sessile ovate
15245 Filam much branched covered with heterogeneous hair-like simple branchlets, Artic very short obsolete

15246 Frond somewhat cartilaginous compressed transversely rugose bipinnated, Pinnules in fruit incurved

15247 Filam nearly separate, Branches erect subulate, Artic rather longer than broad, Pods linear subulate

15248 Filam much branched very fine, Branches and branchlets opposite spreading attenuated acute, Artic half as long again as broad
15249 Filam much branch Branches scatt spread taper ac at tips hyal Artic as long as broad finally tumid
15250 Frond ros like somew spongy d into branches Filam dr Artic 4 times as long as broad

and Miscellaneous Particulars

Hutchinsias, not being aware that the name of Miss Hutchins had previously been applied to a genus of Cruciferæ, by Mr Brown The species of this genus are, perhaps, the most beautiful of all the tribes of Conferva

2300 *Rytiphlæa* So called, it is presumed, from *ῥυτις*, a wrinkle, and *φλοια*, to be filled with any thing The filaments are essentially characterized by their numerous transverse rugosities

2301 *Ectocarpus* From *ἐκτος*, outside, and *καρπος*, fruit, because the thecæ are not included in the substance of the frond, as in the next genus, but placed on the outside Marine plants

History, Use, Propagation, Culture,

2302 *Sphacellaria* This name has been suggested by the *sphacelated* appearance of the truncated extremities of the shoots, in which the reproductive organs are immersed

2303 *Cladostephus* From κλαδος, a branch, and στεφος, a crown, in allusion to the manner in which the first stem is crowned as it were by the little compound whorled branches

2304 *Vaucheria* So named, in honor of M Vaucher, of Geneva, an indefatigable collector of submersed Algæ

2305 *Codium* From κωδιον, a skin, with reference to the appearance of the second species

2306 *Bryopsis.* The filaments of this genus form little pinnated or imbricated branches, resembling bits of moss, whence the name has been formed, from βρυον, a moss, and οψις, resemblance.

15251 Filam twice or thrice dichotom Artic as long as broad, Tubercles ovate racemose on branched peduncles
15252 Filam much branched fine striated, Branches alternate somew pinnated, Articulations as long as broad
15253 Filaments branched rooting straight rigid, Branches scattered simple erect obtuse tapering at the base, Artic about twice as broad as long
15254 Primary filaments branched not jointed surrounded by pectinated spreading branchlets
15255 Filaments bipinnate very fine, Pinnæ and pinnules opposite, Artic very short, Theca ovate stalked
15256 Stem covered with confervoid filam Branches somew. bipinnate, Pinnæ pectinate, Altern. pinnules subul

15257 Setæ simple densely imbricated
15258 Setæ incurved forked or crested imbricated

ULVACEÆ.

15259 Filaments setaceous dichotomous fastigiate, Thecæ globose sessile solitary
β Filaments finer, Thecæ lanceolate and ovate
15260 Filaments flexuose, Thecæ sessile lateral globose
15261 Filaments descending rooting, Thecæ solitary terminal globose
15262 Filaments dichotomous, Thecæ obovate stalked opposite on a common cornute pedic
15263 Filaments branched cæspitose, Thecæ racemose
15264 Filaments branched creeping, Branches erect nearly simple, Thecæ heaped towards the tips

15265 Frond dichotomous fastigiate cylindrical
15266 Frond globose hollow

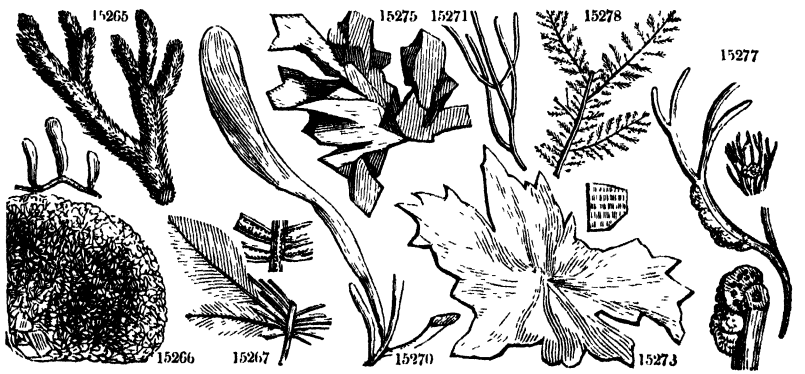
15267 Filam branched naked below, pinnated in the middle, Branchlets opp nearly simple approximating

15268 Frond tubular inflated simple

15269 Frond lanceolate ensiform much tapered at each end wavy crisp

15270 Frond tubular lined clathrate branched filiform compressed, Branches simple tapering at base

15271 Frond tubular irregularly clathrate filiform, Branches tapered

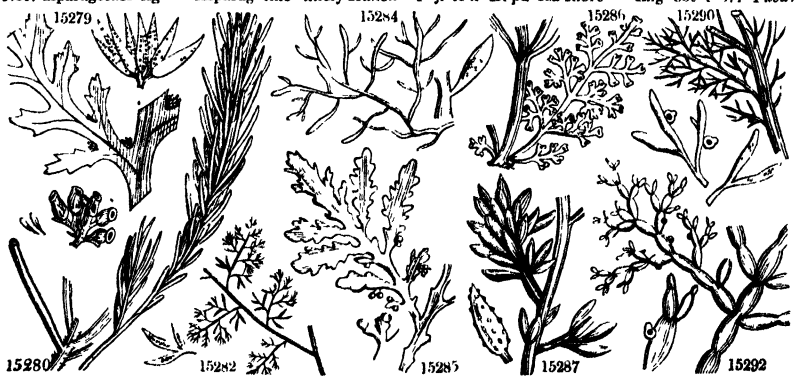


15272 Fronds obovate or lanceolate flat wavy laciniate-crisp
15273 Frond obovate slippery sinuous blistered finally expanded
15274 Fronds blistered plaited-crisp rugose heaped in an expanded layer

15275 Frond flat with numerous dilated segments
15276 Frond flat ovate lanceolate flat wavy crisp at the edge

FLORIDEÆ.

15277 The only species



15278 Jugament filiform compressed, Pinnules opposite pectinate-cut

and Miscellaneous Particulars

2307. *Solenia.* So called, from σωλην, a tube, in allusion to the tubular nature of the frond.
2308 *Ulva* This was the common name applied by the Latins to all kinds of marine plants. The word is said to have been derived from the Celtic *ul*, water The green laver which, stewed with lemon juice, is so much esteemed in England, is the U. lactuca.
2309 *Porphyra* This genus has received its name from πορφυρεος, purple, on account of its being remarkable among Ulvaceæ for possessing that color
2310 *Polyides* From πολυειδης, multifarious, in allusion to the diversity of appearance of the single species.
2311. *Ptilota.* Named in allusion to the form of the frond: from πτιλωτος, pennated.

History, Use, Propagation, Culture,

2312. *Rhodomela* From ῥοδος, red, and μελος, a limb, in allusion to the color of the fronds

2313 *Chondria.* The fronds of this genus are particularly cartilaginous, on which account its name has been formed from χονδρος, cartilage. C pinnatifida is eaten in Scotland, it has a pungent flavor

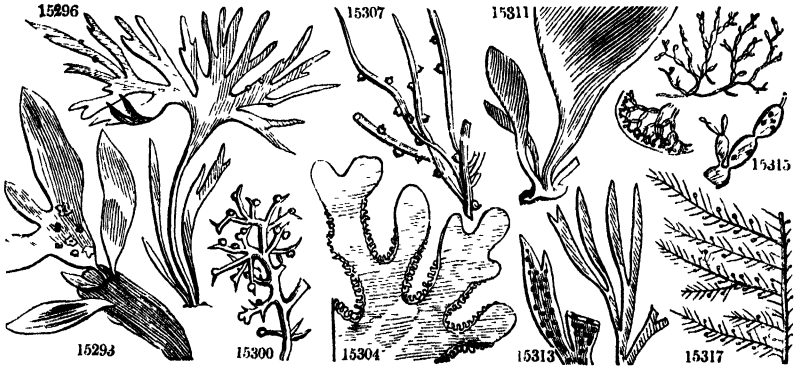
2314. *Sphærococcus* From σφαιρα, an orb, and κοκκος, fruit The theciæ of the genus are round, and contain a globose nucleus full of round sporidia

15279 Frond flat obsoletely ribb alternately bipinnatifid, Pinnæ linear cuneate, Pinnules cut, Thecæ urceolate
15280 Stem filiform covered with setaceous densely imbricated ramenta
15281 Frond filiform much branched, Branchlets setaceous subulate pinnate fascicled
15282 Frond filiform attennuate flexuose branched, Branches bipinnate. upper involute
15283 Frond filiform equal, Ramenta simple about one-sided clustered involute

15284 Frond compres filif somew. contract. here and there, Fructif either min tubere or scatter spor in ramuli
15285 Frond compressed 2-3-pinnate, Pinnæ alternate, Pinnules obtuse callous
15286 Frond round filiform many-times pinnated, Pinnæ opposite cylindrical clavate short horizontal
15287 Stem roundish filiform dichotomous, Ramenta elliptical scattered much attenuated at base
15288 Stem round filiform much branched, Ramenta clavate much attenuated at base
15289 Stem round filiform irregularly branched, Ramenta setaceous much tapered at base
15290 Stem filiform much pinnated, Ramenta linear-lanceolate distichous tapering at base
15291 Frond filiform contracted in joints tubular, Branches whorled
15292 Frond filiform cham-like in joints tubular, Branches fastigiate dichotomous and whorled

15293 Stem scarcely any, Laminæ chained obsoletely ribbed cuneate 2-forked or lanceolate, Thecæ rugose sessile in the disk of the frond
15294 Stem filiform somewhat dichotomous, Branches terminating in oblong 2-forked somewhat proliferous laminæ, Theca spherical subulate terminal
15295 Stem filiform dichotom Branches expanded in cuneiform multifid laminæ Theca stalked ovate cauline
15296 Stem filif nearly simple expanded into a cuneif palm lamin segm ligulate, Thecæ hemisph sess in disk
15297 Frond flat dichotomous, Segments linear cuneiform, Theca hemispherical sess on the disk of the frond
15298 Frond somew channel dichotom segm lin cuneif Thec sphæric scatter on short stalks on disk of frond
15299 Frond membran leathery flat somew lanc somew branched crhat Ciliæ subulate bearing theca at end

15300 Frond cartilagin compressed lin somew dichotom Segm cuhated, Cilæ bear thecæ either at sides or ends
15301 Frond cartilagin corneous distich branched, Segm compressed flat linear bipinn Pinnæ opp spread obt



15302 Frond cartilagin filif compres decomp pinnated, Pinnæ horizontal altern Pinnules bearing thecæ at end
15303 Frond cartilaginous much branched dichotomous pinnated, Segments tapered at base lower compressed 2-edged, the last furcate acute
15304 Frond cartilaginous membranaceous dichotomous or palmate, Segments obtuse somewhat proliferous, Theca immersed in minute unequal processes
15305 Frond membranous dichotomous, Theca spherical marginal sessile
15306 Frond membranous dichotomous, Segm linear upper palmate crested entire, Theca margin immersed
15307 Frond cartilagin round filif Branch long simp surround by little branch Theca hemispher sess scatter
15308 Frond filif corneous rigid equal with entang Branches, Branches horizontal 1-sided cluster forked at end
15309 Fronds filif much branch Branchl setaceous tapered at each end setac Theca sperm attach to branchl

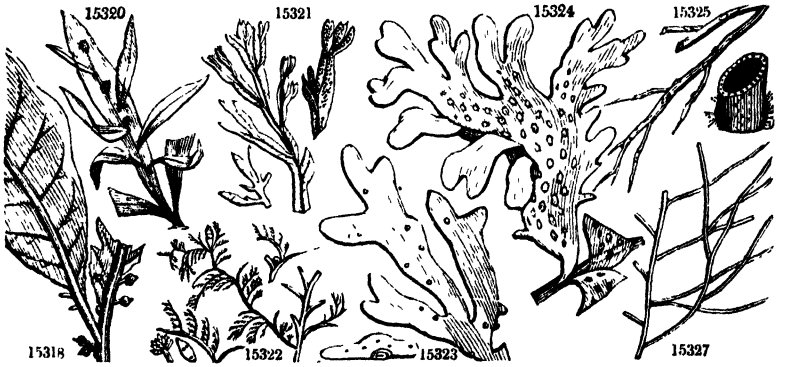
15310 Stem filiform, dilated into a cartilaginous reniform or orbicular entire frond
15311 Frond fleshy flat simple cuneiform tapered at base into the footstalk rounded at end

15312 Frond coriaceous flat palmate entire, Segments cuneate oblong nearly simple

15313 Frond membranous tubular flat dichotomous, Axillæ rounded, Segments linear narrow by degrees sending out from the margin many simple ramenta
15314 Frond gelatinous coriaceous dichotomous, Segments filiform end membranous dilated elliptical lunceol
15315 Frond filiform with contracted articulations
15316 Frond subgelatinous filiform, Branches remote long, Sporules naked in the substance of the branches

15317 Frond filiform compressed much branched, Branchlets setaceous distichous simple pectinate on each side

and Miscellaneous Particulars.



2315 *Halymenia* From ἁλς, the sea, and ὑμην, a membrane Marine plants with flat or tubular membranous fronds. H. edulis is the true Dulse, and H palmata the common Dulse, both of which are eaten in Scotland

2316 *Bonnemaisonia* So called in honor of M Bonnemaison a French cryptogamic botanist, who particularly attended to Confervæ.

History, Use, Propagation, Culture,

2317 *Delesseria.* The most beautiful of the Fucus tribe, so named in honor of M Benjamin Delessert, a distinguished French patron of botany, and now holding the same station among the scientific men of Paris, as was lately occupied in London by Sir Joseph Banks

2318 *Lemanea* Named in honor of M Leman, a French botanist, who possessed a considerable knowledge of Algæ. This genus is the puzzle of writers upon Algæ It differs from all the Nostochinæ in its substance, being in no way gelatinous, and in its compound structure, and separate fruit; from Confervoideæ it is distinguished by its continuous frond, olivaceous color, and leathery texture To Fucoideæ it most nearly related in color, substance, and structure, but it is akin to no other genus, and its habits are entirely different from those of Fucoideæ, the species being all found floating in fresh water.

2319 *Chordaria.* So called from the cord-like appearance of the species

2320. *Scytosiphon.* The fronds of this genus are tubular and coriaceous; whence the name has been contrived, from σκυτος, leather, and σιφων, a siphon.

15318 Stem distinct, Leaves ovate stalked entire costate, Nerves transverse parallel
15319 Stem winged, Leaves linear oblong subsessile proliferous from the costa, Veins diaphanous nearly parallel
15320 Stem winged, Leaves linear-lanceolate costate veinless proliferous from the midrib netted
15321 Frond ribbed obsoletely nerved linear dichotomous alternately pinnatifid towards end, Pinnæ rather lingul

15322 Frond pinnated dichotomous much branched, Last branches falcate inwards and pectinate
15323 Frond very fine linear irregularly split entire at end, Segments rounded at end not veined, Sori marginal
15324 Frond very thin veinless roundish irregularly split at the end, Sori on the disk of the frond

FUCOIDEÆ.

15325 Filaments simple papillose, Papillæ usually ternate, Articulations 5 times as long as broad
β Branched torulose in a moniliform manner here and there
15326 Filaments simple moniliform incurved 1-colored

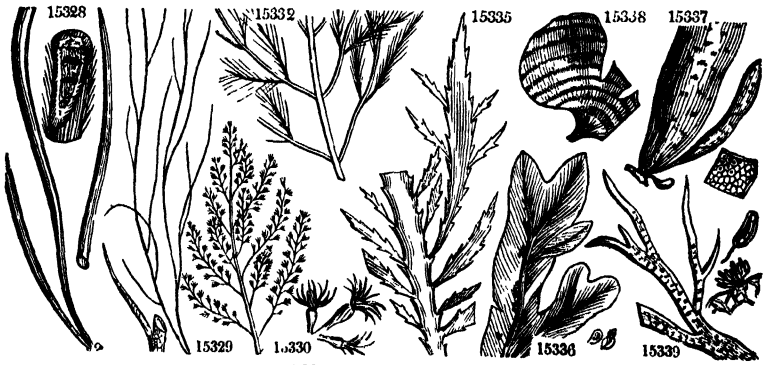
15327 Frond much branched, Branchlets virgate somewhat distichous spreading at base

15328 Frond quite simple

15329 Frond setaceous branched in an irregular manner

15330 Receptl elliptical lateral as long as peduncle
15331 Branches spiny alternate
15332 Frond many times pinnated, Pinnæ opposite capillary
15333 Frond many times pinnated nodose, Pinnæ opposite, Nodi villous
15334 Frond irregularly branched, torulose and rugose in every direction

15335 Frond flat membranous scarcely nerved bipinnate, Pinnæ and pinnules oppo ite linear tapering at base



15336 Frond linear dichotomous entire, Sori heaped about the costa

15337 Frond inflated clavate

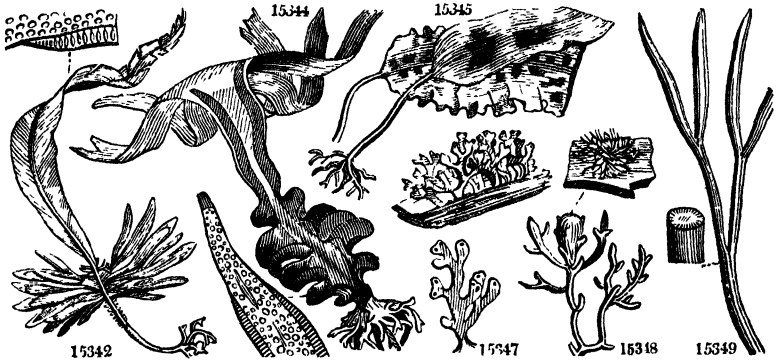
15338 Fronds reniform flabelliform smooth membranous, Zones concentric
15339 Dichotomous entire, Segments erect linear rounded blunt, Theca scattered on the disk
15340 Frond dichotomous entire, Segments long slender acute

15341 Stalk running through the lamina which is riddled with holes
15342 Stalk winged with pinnæ and running through the ensiform lamina
15343 Stalk round expanded into a roundish digitate split entire lamina
15344 Root inflated-bulbous, Stalk flat expanded into a digitate split entire lamina
15345 Stalk compressed expanded into an entire linear-oblong laminæ

15346 Stalk compressed expanded into a thin linear-lanceolate entire lamina

and Miscellaneous Particulars.

2321 *Sporochnus* The meaning of this word is not explained The genus is remarkable for the nature of the reproductive organs, which consist of a minute receptacle formed by some clavate corpuscles, which are jointed and arranged in a concentrical manner, and crowned with tufts of hair



2322. *Halisecris.* This name literally signifies sea-cabbage; from ἅλς, the sea, and σικυς, a sort of cabbage The broad membranous fronds are not unlike the leaves of cabbage

2323. *Encœlium* From ἐν, within, and κοιλος, hollow. The fronds are all tubular and bladdery.

2324. *Zonaria* Beautiful marine plants marked with transverse *zones* or lines, in which the organs of reproduction are supposed to exist

2325 *Laminaria* The reproductive organs of this genus are situated in the form of large sori upon the *lamina* of the frond L esculenta is eaten in Scotland, where it is called *Badderlocks* From L saccharina, when dried in the sun, exudes a dry white sweetish substance, which is eaten as sugar by the poor inhabitants of Iceland. L buccinalis furnishes the singular vegetable production called the sea-trumpet.

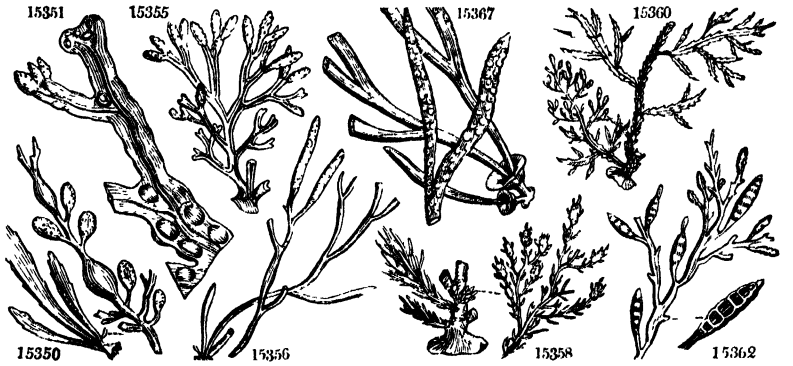
History, Use, Propagation, Culture,

2326. *Lichina* So called in allusion to its supposed convertibility into some one of the Lichen tribe. Sir James Smith has made one species a Lichen and the other a Fucus

2327. *Furcellaria* Named on account of the dichotomous forked or *furcellate* arrangement of the fronds.

2328 *Fucus* So called by the Greeks In Latin, the word signifies paint of any kind, a pigment staining red is afforded by certain species of Fucus Fucus vesiculosus is much employed in the manufacture of kelp. It is common in great variety upon all the sea-coasts of these islands. It is known at first sight by its spherical vesicles filled with air When the plant is dried, it becomes brittle, and of a dull black color, and sometimes it is covered with a saline efflorescence. Medically it is considered deobstruent, and has been found efficacious in scrofulous swellings. (*Thom. Lond. Disp.* 308.)

15347 Frond flat with spherical tubercles
15348 Frond roundish with elliptical tubercles

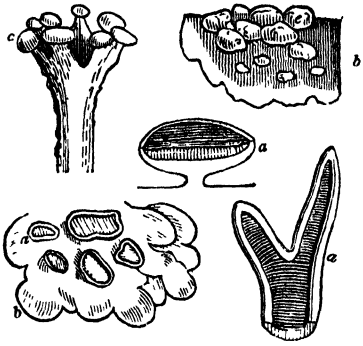


15349 The only species

15350 Stem compressed here and there inflated with internal vesicles, Receptacles lateral distic stalk. pyriform

15351 Frond flat ribbed lin dichotom entire, Vesicles spherical innate upon frond in pairs, Recept. term elliptical

15352 Frond lin. costate ent somew dichotom without vesicles, Lateral segm narrowest multif fruit-bearing
15353 Frond linear entire dichotomous without vesicles ribbed, Receptacles linear-elliptical
15354 Frond dichotomous ribbed serrated, Recept. solitary flat serrated
15355 Frond linear nerveless channelled dichotomous, Recept. terminal
15356 Frond filiform somewhat dichotomous, Recept terminal cylindrical
15357 Cup radic. circular plano-convex emitt. from its centre a frond terminat. in a very long dichotom recept.



15358 Lvs densely spiny all over, Vesic ellipt somew term crown solit Recept warty from inflat. base of spines
15359 Lvs filiform dichotom unarmed, Vesicles lanceolate chained, Recept. terminal ovate ellipt mucronate
15360 Lower leaves thin costate pinnate, Pinnæ lanceolate crenulate, Vesicles lanceolate somewhat solitary
15361 Lvs unarmed filif much branched, Vesicles innate ovate-elliptic somew chained, Recept. filif terminal
15362 Stem compressed pinnated, Leaves distichous flat linear entire, some bearing vesicles, others receptacles

and Miscellaneous Particulars.

For rural economy, this and other species of Fucus are burned for their ashes, which produce the kelp or potash of commerce On those shores of the sea where these plants do not abound, and where the water is sufficiently saline, the different species of fucus are raised artificially, by depositing stones at regular distances, on which the fuci spring up of themselves, and in four years yield a crop fit for cutting Those who are interested on this subject will find ample information in the Transactions of the Highland Society of Scotland (vol viii), and in Headrick's Survey of Forfarshire. A condensed view of what is known on the subject will be found in the Encyclopædia of Agriculture *in loco*

2329 *Cystoseira.* From κυστις, a bladder, and σειρα, a chain. The upper parts of the frond have the appearance of little bladders chained together.

Order 8. LICHENS.

Reproductive organs uniform Sporules deposited in receptacles of various forms, distinct in substance from the thallus or frond, which is either pulverulent, crustaceous, membranous, foliaceous, or branched and shrub-like

This, Algæ, and the collateral order Fungi, may be said to exhibit the lowest stage of vegetable developement, and to contain the simplest forms of which plants are susceptible Indeed it seems that each is resolved into the other when in the least stage of composition Of this order, the lowest tribe, Pseudo-Lichenes, are considered Fungi by some authors, and have been formed into a distinct order by others, under the name of Hypoxyla. Here it seems best to consider them Lichens.

The fructification is usually in the form of shields or cup-like receptacles (*a*), dispersed over the surface of the frond or *thallus* (*b*), and bearing various names according to their nature *Apothecia* is the common term used to designate the fructification *Podetia* are the stalk-like processes of the frond (*c*), which bear the apothecia on their summit *Scyphæ* are cup-like apothecia *Cyphellæ* are pale tubercular spots on the under side of the frond *Lacunæ* are small hollows or pits on the upper surface of the frond *Soredia* are little heaps of free, pulverulent bodies, mostly of a whitish color, placed on various parts of the frond (*c*) *Pulvinuli* are spongy, excrescence-like bodies arising from the frond, and often resembling minute trees *Nucleus proligerus*, or kernel, is a distinct cartilaginous body coming out entire from the apothecia, and containing sporules *Lamina proligera* is a distinct body containing the sporules, separating from the apothecia, often very convex and variable in form, and mostly dissolving into a gelatinous mass. The arrangement of Acharius, which is the most celebrated, is here followed.

Tribe I IDIOTHALAMI.

Apothecia differing in color from the rest of the plant, and formed of a distinct substance.

§ 1. *Apothecia simple, entirely formed of a sub-uniform, pulverulent, or cartilaginous substance* Homogenei

* *Apothecia destitute of a raised margin.*

2330 *Spiloma* Plant crustaceous, spreading, plane, adnate, uniform Apothecia composed of minute bodies, collected into a compact, homogeneous, subpulverulent, naked, and shapeless colored mass

2331 *Solorina* Plant foliaceous, coriaceous, lobed, separate beneath, and veiny or fibrous with down Receptacle adnate, roundish, not edged, covered by a colored membrane, and containing a solid, cellular, bladdery parenchyma.

** *Apothecia with a raised border*

2332 *Lecidea* Plant various, crustaceous, spreading, adnate, and uniform or foliaceous Apothecia scutelliform, sessile, surrounded by a cartilaginous membrane, the disk of the same nature as the raised border

2333 *Caliceum* Plant crustaceous, plane, spreading, adnate, uniform Apothecia cup-shaped, sessile, or stipitate, cartilaginous, containing a compact pulverulent mass, plane or convex, and forming a naked disk

2334 *Gyrophora* Plant foliaceous, coriaceous, or cartilaginous, peltate, mostly monophyllous, free beneath Apothecia subscutelliform, sessile, or adnate, covered with a black cartilaginous membrane, the disk warty or plaited in circles, and bordered

§ 2. *Apothecia subsimple, included, formed of a single covering, containing a capsular body or nucleus* Heterogenei.

2335 *Endocarpon* Plant crustaceous, adnate, of some determinate figure, or foliaceous and peltate Apothecia globose, concealed in the substance of the plant, surrounded by a thin membrane, furnished with a slightly prominent orifice, and containing a nucleus

Tribe II CŒNOTHALAMI

Apothecia partly formed from the substance of the plant

§ 1 *Apothecia included in wart-like processes, formed from the substance of the plant.* Physmatoidei

2336 *Thelotrema* Plant crustaceous, cartilaginous, plane, spreading, adnate, uniform, with wart-like receptacles, furnished with a wide pore, and bordered Apothecia included, and containing a nucleus within a double covering

2337 *Pyrenula* Plant crustaceous, plano-expanded, adnate, uniform Receptacle wart-like, formed of the thallus, enclosing or surrounding at the base a solitary thalamium, with a simple, thick, papillose peritheciun, containing a globose cellular nut

2338 *Variolaria* Plant crustaceous, plane, spreading, adnate, uniform Apothecia wart-like, formed from the crust (resembling soredia), submarginate, white, including a naked nucleus

§ 2. *Apothecia scutelliform, subsessile, the disk of a peculiar color different from the border, which is formed from the crust* Discoidei

2339 *Urceolaria* Plant crustaceous, spreading, adnate, uniform Apothecia shield like, the disk concave, colored, immersed in the crust, border formed from the crust, and the same color

2340 *Lecanora* Plant crustaceous, spreading, adnate, plane, uniform Apothecia shield-like, thick, adnate, and sessile, the disk plano-convex, colored, border thickish, somewhat free, formed from the crust, and the same color

2341. *Parmelia.* Plant foliaceous, between coriaceous and membranaceous, spreading, appressed, orbicular, lobed, and stellate, variously divided, fibrous beneath Apothecia shield-like, attached by a central point, the disk concave, colored, with a border formed from the crust.

2342 *Borrera* Plant cartilaginous, branched, and laciniate, the segments free, channelled beneath, and ciliate at the margin Apothecia shield-like, with a colored disk, the border formed from the frond

2343 *Cetraria* Plant cartilagino-membranaceous, ascending or spreading, lobed, smooth, and naked on both sides Apothecia shield-like, obliquely adnate with the margin, the disk colored, plano-concave, border inflexed, derived from the frond.

2344 *Sticta* Plant foliaceous, coriaceo-cartilaginous, spreading, lobed, free and pubescent beneath, with little cavities or hollow spots Apothecia shield-like, fixed by a central point, the disk colored, plane, border formed from the crust

2345 *Peltidea* Plant foliaceous, coriaceous, spreading, subadnate, lobed, with woolly veins beneath Apothecia orbicular, adnate, on produced portions of the frond, the disk colored, border very thin, formed from the frond

2346 *Nephroma* Plant foliaceous, coriaceous, membranous, expanded, lobed, beneath separate, and naked or villous. Receptacles resupinate, formed of the ascending lengthened lobes of the thallus Fertile lamina reniform, entirely attached to the thallus and its lower side, and surrounded by an elevated inflexed margin

2347 *Roccella* Plant coriaceous, cartilaginous, branched, laciniated, round or flat, erect or pendulous, woolly inside Receptacles shield-like, thick, growing into the thallus Fertile lamina forming a disk, plano-convex, colored, and cartilaginous, in the inside hyaline, and of a similar nature, surrounded by a margin, which is elevated, sessile, and as deep as the disk, and which contains a compact black powdery mass, which is hidden within the substance of the thallus

2348 *Evernia* Plant branched, laciniate, angular, or compressed, suberect or pendulous, with a central filament within Apothecia shield-like, sessile, the disk concave, colored, border formed the frond

§ 3 *Apothecia subglobose, terminating the branches or podetia, or scattered, sessile, and emarginate.*
CEPHALOIDEI

* *Apothecia covered by the mass of the fructification*

2349 *Cenomyce* General receptacle subcartilaginous, foliaceous, laciniate, subimbricated, free (rarely adnate, uniform, or wanting) Apothecia on podetia, orbicular, immarginate at length, capituliform, bearing thick colored masses of fructification

2350 *Becomyces* Plant crustaceous, spreading, plane, adnate Apothecia on short, soft, solid, simple podetia, capituliform, solid, immarginate, colored, convex, reflexed at the margin

2351 *Isidium* Plant crustaceous, plane, spreading, adnate, uniform Apothecia on very short solid podetia, orbicular, convex, solid, terminal, the disk submmersed, having a border formed from the substance of the podetia.

2352 *Stereocaulon* Plant shrubby cartilaginous, branched Apothecia turbinate, sessile, solid, plane above, at length subglobose, with a border formed from the frond

** *Apothecia clothed with the substance of the frond, and containing a pulverulent mass*

2353 *Sphærophoron* Plant cartilaginous, fibrous within, solid, shrubby, branched Apothecia sessile, terminal, subglobose, bursting irregularly, and containing a black, globular, pulverulent mass

TRIBE III HOMOTHALAMI

Apothecia entirely formed of the substance of the frond, and of a similar color

2354 *Alectoria* Plant cartilaginous, subfiliform, fibrous, and somewhat fistulose within, branched, prostrate, or pendulous Apothecia shield-like, thick, sessile, bordered, wholly formed from the frond

2355 *Ramalina* Plant cartilaginous, fibrous, and nearly solid within, branched, somewhat shrubby, mostly sorediferous Apothecia shield-like, thick, subpedicellate and subpeltate, plane, bordered, wholly formed from the substance of the frond

2356 *Cornicularia* Plant cartilaginous, fibrous, and nearly solid within, branched, shrubby Apothecia orbicular, terminal, obliquely peltate, at length convex, somewhat inflated, the border dentate

2357 *Usnea* Plant much branched, filiform, mostly pendulous, furnished within with a bundle of elastic fibres Apothecia orbicular, terminal, peltate, often ciliate at the border

2358 *Collema* Plant subgelatinous, homogeneous, crustiform, foliaceous, or somewhat branched, membranaceous or cartilaginous when dry Apothecia shield-like, bordered, formed from the substance of the frond, the disk sometimes differing in color when dried

TRIBE IV ATHALAMI

Lichens destitute of apothecia, and whose fructification is unknown

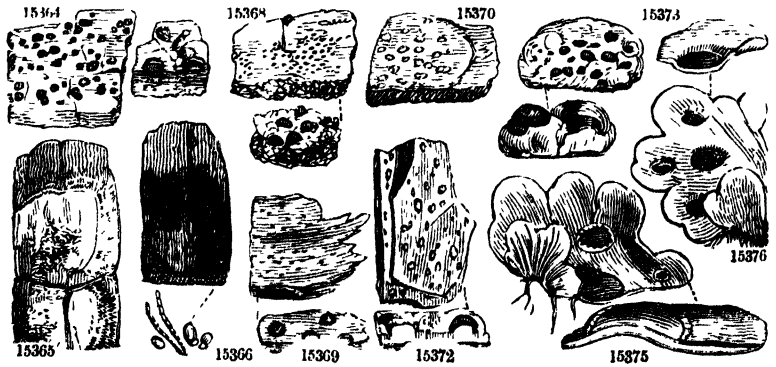
2359. *Lepraria.* Whole plant crustaceo-pulverulent, spreading, adnate, uniform Apothecia unknown

TRIBE V PSEUDO-LICHENES

Apothecia black, corneous, imbedded in a receptacle Sporules in slender tubular cells, lying in a pulp, not spontaneously emitted

2360 *Opegrapha* Plant crustaceous, flat, expanded, adnate, uniform Receptacle oblong and elongated, sessile, covered with a cartilaginous dark membrane, enclosing a solid parenchyma Disk linear, edged on each side

2361 *Verrucaria* Plant crustaceous, plane, expanded, adnate, uniform Receptacle hemispherical, roundish at the base, growing into the thallus, with a double perithecium, exterior somewhat cartilaginous and thick, having above a little pimple or perforation, inner very fine, and membranous Kernel cellular



2362 *Porina* Plant crustaceous, cartilaginous, plano-expanded, adnate, uniform Receptacle wart-like, formed out of the thallus, and not margined Thalamium imbedded in the substance of the wart, with a simple very thin perithecium, and a colored orifice thicker at the surface of the wart. Kernel roundish, cellular

2363 *Arthonia* Plant crustaceous, plano-expanded, adnate, uniform Receptacle innate, sessile, of an irregular roundish figure, without an edge, covered by a somewhat cartilaginous membrane, and containing a solid uniform kernel

2364 *Graphis* Plant crustaceous, plano-expanded, adnate, uniform Receptacle long, immersed in the thallus, with a simple cartilaginous perithecium, which forms an edge all round the linear kernel, which is naked at top and bottom, and cellular inside

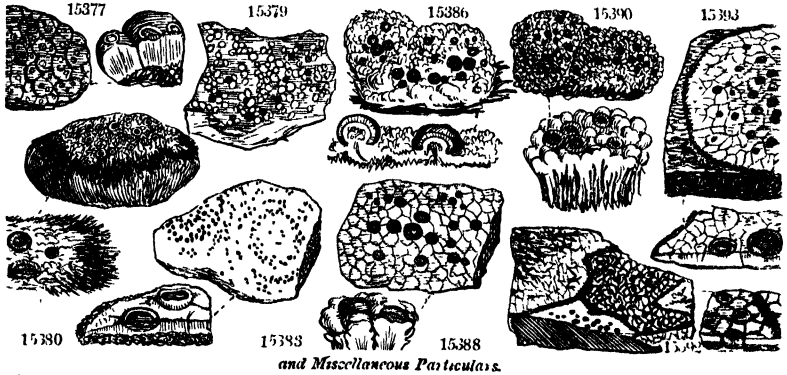
History, Use, Propagation, Culture,

2330. *Spiloma.* This word signifies in Greek, a spreading discoloration of the cuticle, and well expresses the general character of the genus.

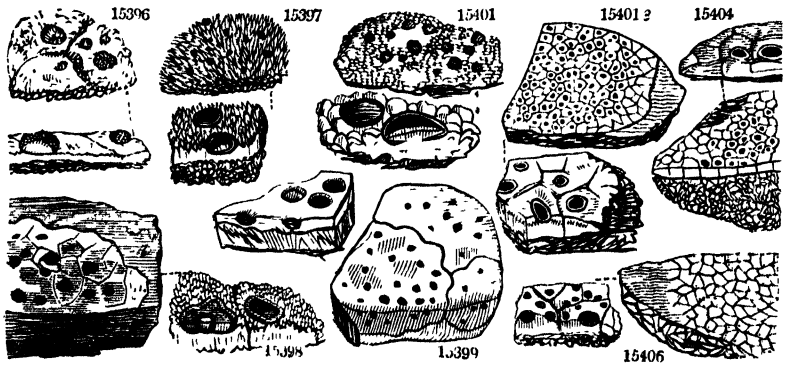


IDIOTHALAMI.

15363 Crust somewhat cartilaginous whitish, Apothecia crowded tumid oblong varying in figure roughish reddish at length brownish black and somewhat prunose
15364 Crust somewhat cartilaginous powdery cracked variegated with cinereous and yellow, Apothecia immersed superficial roundish finally confluent
15365 Crust very thin glauc Apothecia burst. forth min convex cluster and confluent somew branch dark-color
15366 Crust very thin greyish, Apothecia flat diluted irregular somewhat confluent black
15367 Crust spread widely very thin membran greyish, Apothecia dot-like very min black lead-color when dry
15368 Crust obsolete or white, Apothecia very minute black confluent without bristles
15369 Crust filmy very thin green grey, Apothecia mostly dispers hemispher sooty internally yellowish green
15370 Crust spreading widely very thin, for the most part membranous greyish white, yellowish green when rubbed, Apothecia minute flat confluent blueish grey
15371 Crust thin somew. powd. white, Apoth scatter min dot-like solid black with superfic. dark-brown powder
15372 Crust tartar. rugg greyish-white cracked, Apothecia convex round very black their centers often decid
15373 Crust tartar rugged greyish or greenish-white, Apothecia convex rounded black orange-colored within
15374 Crust calcareous greenish-white, Apothecia scattered somew confluent unequal elevated granulat black

15375 Thallus green (brown when dry) lobed ben veiny and of a fine saffron-col Apothecia somew. tum brown
15376 Thallus lobed grey-green whiter and fibrous ben Apothecia at length sunk into deep pits or hollows brown

† *Thallus crustaceous reniform.*
* *Apothecia constantly black, naked, (not prunose).*



15377 Crust tessellated greyish-black smooth, Apothecia several together depressed brownish-black with a paler border, at length crowded elevated the border being obliterated
15378 Crust continued tessellat greyish-black, Apothecia immersed between the areolæ plane at length convex somewhat angular black of the same color within
15379 Crust spreading very thin cracked black with swelling whitish scattered areolæ, Apothecia plane or slightly convex often in the interstices black, of the same color within
15380 Crust very thin black cracked and tessellated areolæ chesnut-brown plane marginated shining scattered, Apothecia rather convex black margined white within
15381 Crust subcartilaginous tessellat smoothish brownish grey, Apothecia buried in the crust plane margined at length convex clustered and losing their margin black within greyish-black
15382 Crust tartareous cracked whitish ash-color, Apothecia within the spaces of the crust depressed flat finally convex somewhat confluent dark with a thin edge
15383 Crust thin roundish very finely cracked somewhat powdery white, Apothecia grown into the crust thick protuberant somewhat concentrical dark-colored with a tumid elevated contracted margin
15384 Crust tartareous somew spreading tessellated nearly even greyish-brown, Apothecia sessile at length irregular convex subglobose confluent black emarginate within having a thin greyish stratum ben disk
15385 Crust thin submembranaceous greyish-white bordered with black at length spreading somew granulated, Apothecia nearly plane sessile margined black blackish within
15386 Crust rugose and warted greyish-white, Apothecia at length convex hemispherical somew tuberculated black horny and black within having beneath a powdery bright red stratum
15387 Crust scattered granular irregularly lobed cinereous whitish, Apothecia clustered convex sessile plano-convex hemispherical somewhat confluent dark powdery inside
β Crust scattered granular somewhat cohering white cæsious or cinereous brown, Apothecia hemispherical somewhat globose often clustered shining
15388 Crust tartareous broken into cracks with wart-like smooth cracked cinereous areolæ, Apothecia deeply immersed convex aggregate scarcely edged dark-colored
15389 Crust tartareous brownish ash-colored composed of granulated warts, Tubercles convex irregular black with an obsolete black border
15390 Crust somewhat cartilaginous scaly granular glaucous cinereous, Granules flattish crenulated, Apothecia sessile plano-concave edged finally wavy
15391 Crust rugose somewhat granular ferruginous ash-colored, Apothecia superficial flat edged finally flexuose and convex, Edge finally obliterated
15392 Crust spreading thin black scattered with planeish subcontiguous bright-yellow areolæ, Apothecia plane or slightly concave black of the same color within
β Areolæ bright-yellow plane angular black between and with a black margin
15393 Crust tartareous tessellated yellowish-red, Apothecia sessile plane at length convex irregular confluent black internally cernuous and black
15394 Crust granulated and tessellated somewhat pulverulent ochraceous red, Apothecia minute elevated with the margin tumid the disk depressed black nearly of the same color internally

and Miscellaneous Particulars.

2331 *Solorina* From σολες, solid, and ενος, a skin, in allusion to the firm texture of the fond.

15395 Crust membranaceous white with a greyish or whitish-grey powdery substance scattered over it in small clusters, Apothecia minute appressed plane black
15396 Crust leprous granul powdery green -yell Apothecia sess margin finally convex dark of same col inside
15397 Crust granular somewhat gelatinous greenish-brown, Apothecia appressed marg.ned finally hemispherical clustered dark of the same color inside
15398 Crust globose warted powdery cinereous yellowish, Apothecia convex scabrous

** *Apothecia black, naked when moistened becoming-red or brown*

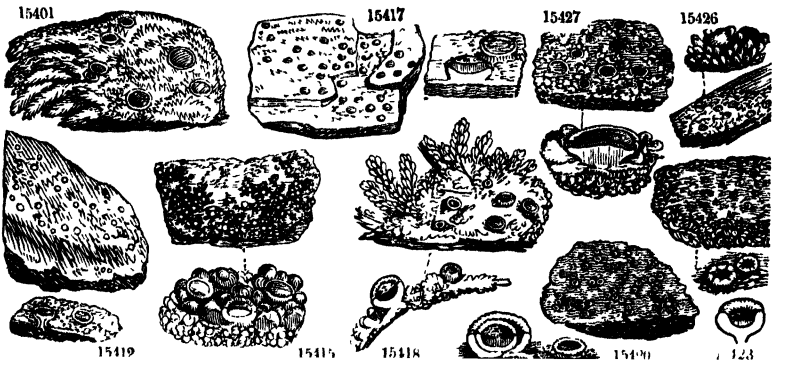
15399 Crust thin whitish, Apothecia plano-convex immersed in the stone margined dark: disk prunose; when moistened crimson, white inside
15400 Crust cracked into areolæ brownish ash-color edged with dark lines, Apothecia sessile flat becoming convex edged irregular black

*** *Apothecia black with a grey bloom.*

15401 Crust tartareous contiguous even at length somewhat tessellated and whitish, Apothecia sessile and elevated plane black with a grey bloom and a black smooth border
β Crust of a regular figure contiguous whitish cæsious, Apothecia immersed disk depressed hollowish
15402 Crust spreading very thin smooth glaucous. fructification subsessile plane black with a grey bloom, the border raised and swelling
15403 Crust tartareous contiguous very white, Apothecia sessile thick black powdery margined becoming convex with an ash-colored layer under the disk
15404 Crust tartareous defined tessellated white areolæ swelling, Apothecia sessile hemispherical with a grey bloom black within with a thin persistent margin
15405 Crust somewhat tartareous granular areolated uneven very white, Apothecia minute somew. immersed cæsious becoming subglobose not margined dark cinereous inside
15406 Crust thick greyish-white cracked rugose at length mealy very white within, Apothecia numerous scattered minute at first prominent and pale-brown, then concave and black

**** *Apothecia black-brown, brownish, or deadened by some other color*

15407 Crust somewhat effuse granular cinereous greenish, Apothecia appressed flat dark-brown. inside dirty-white with a thin flexuose edge paler than the disk
15408 Crust lep granul pale yellow -brown, Apoth somew immers becom conv not margin brown and black
15409 Crust thin granulat somew farin green or green brown fructific conv rug irregul conflu black -brown
15410 Crust spread leproso farin soft uneven glauc green, Apothecia scatter sess brown with marg ent paler
15411 Crust tartareous cracked and broken uneven smoothish pale sulphur-color, Apothecia adnate plane scarcely margined brown and scarcely paler in the margin, at length irregular and convex
15412 Crust cracked areolated uneven somewhat powdery sulphureous, Apothecia minute sessile convex not margined whole-colored becoming hemispherical
15413 Crust granulated greyish-white, Granules becoming pulverulent, Apothecia nearly plane red flesh-colored livid or brown with the elevated margin paler, at length flexuose



15414 Crust firmer granulat and subpapill Apothecia at length hemispheric rug brown -black and black conflu.
15415 Crust thin tartareous contiguous greyish-white, Apothecia immersed plane margined, at length convex: the margin persistent glabrous reddish-brown, of the same color within
15416 Crust thin whit cover. with somew globul pale gran at length grey Apoth sess becom conv yel -brown
15417 Crust thin membranous hoary finally granular powdery, Apothecia sessile concave thick tumid brown flesh-colored with an edge of the same color
β Crust very thin naked whitish, Apothecia flattish scarcely margined waxy purple brown and black
15418 Crust spreading very thin membranaceous white or greyish somew shining subgranulose, Apothecia plane yellow-brown, at length red-brown with the margin paler elevated, at length flexuose
15419 Crust thin somewhat cracked uneven greyish-white fructification plane, at length angular and irregular yellowish or reddish-brown, the border narrow persistent
15420 Crust spreading somewhat scaly uneven roughish darkish-brown, Apothecia minute plane reddish yellow with the margin paler, at length somewhat convex and brownish

***** *Apothecia dark-red, or whitish flesh-color*

15421 Crust tessellated rugose darkish-grey, Apothecia plane rusty orange the margin sometimes crenulate, at length convex with the margin obsolete blackish-red
15422 Crust leprose uneven somewhat granulated greenish-white, Apothecia nearly sessile plane flesh-colored, at length waved roughish in the disk margin scarcely any
15423 Crust thin grey.-white, Apothecia somew glob at length urceol white disk flesh-color, marg tum ent
15424 Crust thin smoothish minutely granulated greyish-white, Apothecia slightly convex entire whitish rose-color paler at the margin

****** *Apothecia pale, yellowish, waxen or orange-colored*

15425 Crust thin white powdery, Apothecia plano-convex smooth edged pale-yellow
15426 Crust cartilaginous cracked rugoso-plicate granulated white or greenish, Apothecia nearly sessile plane at length slightly convex waved unequal clustered pale yellowish
15427 Crust subtartareous tessellated pale, Apothecia nearly plane with the margin lobed waved clustered, at length subglobose destitute of margin yellowish flesh-color

History, Use, Propagation, Culture,

2333. *Calicium.* From καλυκιον, a little cup, well expressing the appearance of the organs of reproduction. All the species form grey, white, or yellow patches, of various extent, on old wrought wood, or boards exposed to the weather.

2334. *Gyrophora.* So named, from γυρος, a circle, and φερω, in allusion to the concentric circles, more or less

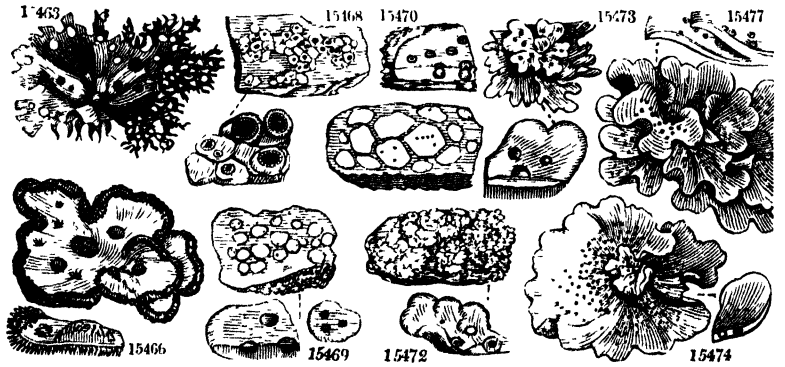
15428 Crust thin leprose powdery soft pale green -yellow, Apothecia slightly convex pale yellowish · marg obsol
15429 Crust thin effuse somew granul black, Apothecia min. cluster flat yellow with an elevat. ent. paler marg.
15430 Crust thin smooth white, Apoth crowd at length convex hemispher. margin. orange-color. white within

†† *Thallus crustaceous, of a regular figure or leaf.* Lepidoma.

15431 Crust somewhat imbricated white hoary, Lobes crenate reflexed tumid, Apothecia appressed black glaucous, edge finally wavy
15432 Crust somewhat imbricated brownish-black covered with a greyish powder, Lobes entire swelling, Apothecia black naked, at length hemispherical with the margin obsolete
15433 Crust imbricat. green -brown, Lobes round cren paler ben Apothecia plane, at length somew. conv black
15434 Crust somewhat contiguous lobed areolate and imbricated cinereous brownish-lurid, Lobes becoming flexuose cut-crenate, Apothecia appressed not edged flattish finally confluent
15435 Crust imbricated pale olive-green, Lobes distinct reniform nearly erect beneath and the margin powdery, Apothecia plane margined glaucous black
15436 Crust indeterminate very thin fibrous black with white convex crowded smooth warts, Apothecia solitary in each wart depressed coal-black with a border of the same color
15437 Crust somewhat imbricated, Lobes rounded crenate livid-brownish white beneath surrounding the apothecia, which are hemispherical clustered reddish not margined
15438 Crust subimbricated, Lobes distinct subpeltate roundish flesh-colored and red brown whitish beneath, Apothecia in their border convex and subglobose black margin obsolete
15439 Crust imbricated glaucous white, Lobes minute rounded convex, Apothecia convex rufous brown becoming blackish margin thin entire
15440 Thallus slightly imbricated fragmentary grey.-green on a dense black fibrous cushion its segm somewhat linear lobed crenate and granular at the margin, Apothecia scattered tawny paler at the marg at length convex brown obliterating the margin
15441 Crust orbicul rugose plait hoary lobed-plait in circumfer Apothecia central plano-convex dark-colored
15442 Closely imbricated radiated membranous very smooth brownish-grey pale with black fibres below · its segments linear obtuse undulated, Apothecia black with a black border of their own substance

15443 Crust areolated-warted smoothish wavy, Apothecia sessile dark opaque, Disk flat tumid at edge
15444 Crust somewhat contiguous unequal whitish or none, Apothecia sessile subglobose dark smooth: disk dot-like becoming flattish with a thin shining margin
15445 Crust somewhat tartareous contiguous wrinkled olive-green, Apothecia roundish dark shining: disk depressed opaque, and stalks short whole-colored
15446 Crust effused greyish somewhat pulverulent fructification subglobose, at length flattened greyish-black with a cylindrical thickish-black peduncle
15447 Crust very thin grey smooth, Apothecia subglob disk dark-brown; margin greyish, Stripes filif black
15448 Crust cartilaginous areolate rugose smooth yellow-green, Apothecia lentiform ferruginous powdery, Stems short cylindrical dark-pitch color thicker at base
15449 Crust lemon-yellow granulated and conglomerated fructification subturbinate, disk brown convex, the border yellow and pulverulent, Peduncle filiform blackish and shining at the base
15450 Crust thin white ash- olor Apothe becom lentif disk black -brown cmer prum with a yell -green marg
15451 Crust thin whitish powdery, Apothecia lentiform disk flesh-colored becoming brown powdered, Stalks filiform naked pale becoming brownish or black
15452 Crust effuse powdery greenish-yellow, Apothecia globose, and stalks filif. very long flexuose yellow -green
15453 Crust leprous powdery pale yellowish-green, Apothecia hemispherical globose and stalks tapering upwards straight powdered with fulvous
15454 Crust thin granulated tartareous rusty white, Apothecia on short stalks thick black often compound with a pale rusty disk
15455 Crust white granulat Tuber. a little prominent round flatt gray -black powdery with a smooth black edge
15456 Crust granulated smooth greyish-white, Tubercles scattered roundish black polished wrinkled irregular without a border mostly sessile
15457 Crust membran very thin white, Tuber black convex with recurv marg on long slend. wavy black stalks
15458 Crust thin tartareous somewhat granulated of a verdigrease-grey, Apothecia on slender black stalks black hemispherical with a convex brownish-black disk
15459 Crust filmy very thin whitish, Apothecia on thickish black stalks obovate or hemispherical black with black prominent loose powder

15460 Thallus smooth blackish-green ben smooth black and naked, Apothecia at length conv rough and plait.
β Thallus of many lvs or lobes variously fold black -green quite black ben. on each side naked and smooth
15461 Thallus membranaceous with elevated reticulations, at length of a smoky ash-color rough smoother paler and subfibrillose beneath, Apothecia turbinate, at length convex variously plaited
β Thallus thick hard rigid with elevated dots rugose olive-brown becoming black naked smooth pale-yellow beneath, Apothecia globose
15462 Thallus somewhat naked dark greenish-grey folded and lobed strongly ciliated beneath smooth pale with branching fibres, Apothecia elevated nearly plane with concentric and plaited lines



and Miscellaneous Particulars

complicated, observable in the disk of the receptacles of the shields. The species grow chiefly upon exposed alpine rocks, chiefly on granite or volcanic stones. The vitrified forts in the Highlands of Scotland produce some of them.

History, Use, Propagation, Culture,

2335. *Endocarpon* From ἔνδον, within, and καρπος, fruit, because the receptacles of the sporules are deeply imbedded in the substance of the frond The species form small roundish or angular plants, commonly closely sessile upon earth or stone, of a grey or olive hue, their fructification appearing like little black dots over the surface.

2336. *Thelotrema* From θηλη, a nipple, and τρημα, an orifice The protruberances of the thallus are perforated. This genus has been reduced to Endocarpon by Sir James Smith.

15463 Thallus rugged olivaceous brown, its circumference perforated and laciniated dark-grey: beneath glabrous somewhat granulated and fibrous, Apothecia somewhat convex variously plaited
15464 Thallus roughish olivaceous brown with a brown scattered dust smooth beneath with pits and reticulations naked of the same color, Apothecia plane with circular plaits, at length convex
15465 Thallus blistered and warty greenish ash-color ben. deeply pitted smooth palish-brown naked, Apothecia few plane margined disk somewhat even papillose and plaited
15466 Thallus smooth sinuato-lobate of a greenish coppery-brown beneath black with dense pulvinate fibres, Apothecia sessile, at length somewhat globose variously plaited intricate
15467 Thallus very rig mouse-col. ben. black-brown rough with elevat. paler spots, Apoth. conv. various. plait.

15468 Thallus crustaceous cracked into areolæ figured somewhat lobed greenish rubiginous depressed at the circumference, Orifices depressed black
15469 Thallus crustaceo-cartilaginous somewhat foliaceous minute subpeltate appressed plane roundish entire yellow-green, Orifices of the apothecia depressed reddish-brown
15470 Thallus crustaceous submembranaceous spreading and subfoliaceous contiguous wavy cracked glaucous ash-col irregul lob and crenat at marg ben black somew spongy, Orifi elevat conv black perforat
15471 Plant subcartilaginous roundish or somewhat angular lobed of an olive-green beneath pale at margin; the rest blackish and fibrillose, Orifice of the fructification subprominent dark-brown
β Lobes of thallus aggregat somew imbricat. margin elevated repand-lobed wavy with black wool beneath
15472 Thallus coriaceous membranous pallid leafy greenish crenate-lobed becoming irregularly ragged, Orifices hemispherical pale with a black dot
15473 Thallus coriaceous convex rounded lobed copper-colored, at length rugged black and shaggy beneath, Orifices scattered sunk minute coal black, at length convex
15474 Thallus thick crustaceo-cartilaginous foliaceous orbicular peltate greyish spread at marg somewhat lobed and waved beneath smooth, at length rugose and tawny, Orifices minute slightly prominent brownish
15475 Thallus cartilaginous foliaceous orbicular peltate brown or greyish the border spread and wavy smooth naked rough and black beneath, Orifices of the apothecia very minute slightly prominent black
15476 Thallus coriaceo-cartilaginous lobed greyish beneath brownish-black, the lobes nearly erect rounded plicate and convolute, Orifices of the apothecia numerous convex black
15477 Thallus cartilagineo-coriaceous lobed greenish-brown olivaceous beneath rather tawny or blackish on both sides smooth, the lobes laciniated waved plaited and crisped crowd. Orifices rather convex black

CŒNOTHALAMI.

15478 Crust smooth whitish, Warts of the apothecia smooth somewhat cone-shaped with the margin of the aperture thin simple somew inflexed and contracted covered at bottom with a membrane which bursts
15479 Crust subtartareous thin contiguous greyish, Warts of the apothecia convex halt immersed whiter, Orifices much contracted radiated with fissures concealing the flesh-colored apothecia
15480 Crust nearly regular smooth rugulose cinereous, Warts of apothecia clustered irregular whitish with a large black aperture and a thick somewhat angular lacerated edge
β Crust white powdery with granul and min soredia, Warts of apothecia appres few and immers in crust
15481 Crustaceous cream-colored with scattered rather convex warts opening by an irregular inflexed orifice, Apothecia immersed depressed brown
15482 Crust cartilaginous uneven somewhat polished greenish-grey, at length extremely tumid and uneven, Apothecia elevated crowded hollow very irregular

15483 Crust cartilaginous membranous polished pale brownish cinereous, Warts of apothecia closed closing surrounding the upper projecting part of the thalamium
15484 Crust tartareous somewhat tessellated unequal brownish-black, Warts of the apothecia spreading at the base depressed somewhat rugose surrounding the greater part of the prominent apothecia
15485 Crust tartareous unequal cracked into areolæ cinereous yellowish, Warts of apothecia enlarged at their base depressed closed clustered about the edged orifice
15486 Crust tartareous regular finely cracked cinereous rufous, Warts of apothecia smooth reddish depressed above forming a margin to the papilla-like prominent orifice

15487 Crust determined somewhat cartilaginous smooth very white plaited in rays, Warts of apothecia polished compressed tumid kernel covered with a thin powdery skin
15488 Crust subcartilaginous cracked into areolæ granular cinereous, Warts of apothecia convex clustered granular, kernel lentiform enclosed
15489 Crust subcartilaginous greyish uneven with granules and soredia scattered in an irregular manner, Warts of fructificat subglob smooth, at length depressed above and soredifer and contain a concave nucleus

and Miscellaneous Particulars.

2337. *Pyrenula.* A diminutive of πυρην, a kernel, in allusion to the manner in which the receptacle is enclosed in the thalamium, as a kernel within its shell Crustaceous plants, found chiefly upon the bark of trees

2338 *Variolaria* The shields of these plants resemble the eruptive spots of the variolæ or measles The whole genus was referred by Linnæus to his Lichen fagineus and lacteus. The species are of a crustaceous nature, found upon the trunks of trees, rocks, walls, or the ground.

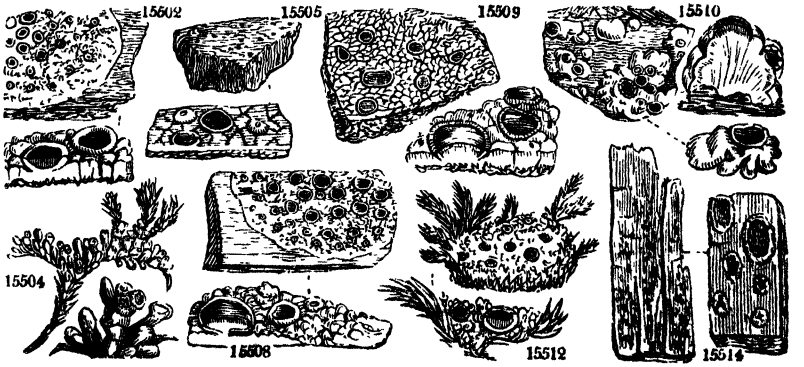
History, Use, Propagation, Culture,

2339 *Urceolaria* From *urceolus*, a little pitcher, with reference to the form of the shields, which are sunken in the crust Natives of hard stones occasionally inundated, or upon naked exposed rocks, occasionally upon the trunks of trees The crust of U esculenta, a native of Tartary, is eatable.

2340. *Lecanora.* An unexplained name Lecanora perellis affords a purple dye, and is called in the south of France, where it is employed in lieu of the L tartarea, *Perelle d'Auvergne*, whence the specific name, as Smith

15490 Crust cartilaginous polished whitish becoming unequal and ash-colored scattered with white soredia having no margin, Warts of apothecia spheroidal powdery
β Crust tartaceous cartilaginous determined glaucous with a polished radiated cracked circumference, Soredia scattered superficial flat not margined
15491 Crust rugose cracked uneven subpulverulent white or greyish, Warts of the apothecia appressed plano-concave margined bearing soredia of the same color as the crust
β Crust pulverulent white, at length greyish naked, Soredia crowded, at length spreading waved plano-concave with the margin raised swollen
15492 Crust tartareous distinctly bordered cracked smooth white: the circumference somewhat zoned crenato-lobate, Warts of the apothecia crowded margined very white and pulverulent
15493 Crust elliptical thin slightly tartareous rugged grey scarcely limited, Apothecia rounded with a narrow border, Powder greenish
15494 Crust tartareous thickish greyish-white cracked tumid papillary and rugged obscurely zoned at the circumference, Apothecia orbicular prominent white
15495 Crust orbicular tartareous thin ash-colored cracked: its circumference indeterminate, Apothecia orbicular very small white with an elevated margin and flesh-colored disk



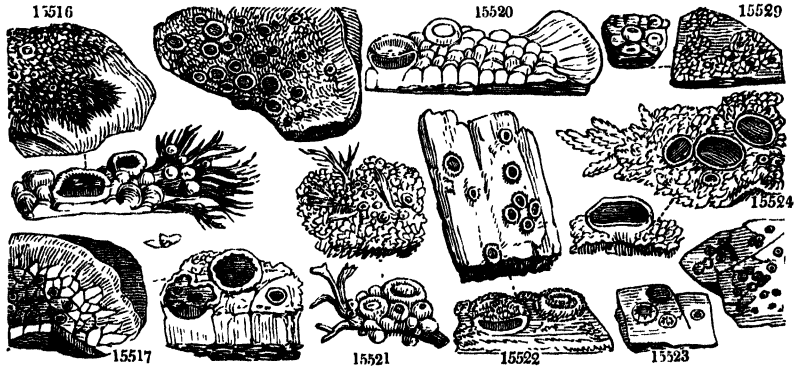
15496 Crust with a rather decided edge smooth with narrow cracks pale brick-colored: disk redd., marg tum.
β Crust bordered smooth tessellated reddish, at length white, Apothecia becoming elevated with the disk rather convex reddish-brown reaching the margin of the crust
15497 Crust papillose warted polished white ash-color disk concave black immersed in the tip of the warts, Border contracted protuberant crenated entire
15498 Crust cracked areolate warted cinereous bordered with black: disk somewhat concave dark immersed among the warts becoming elevated, Border thickish projecting
15499 Crust rugoso-plicate granulated white or greyish fructification urceolate, the disk black, the border swelling inflexed subrugose covering the disk
15500 Crust continued calcareous smooth brownish-white irregularly cracked when dry, Apothecia very minute blackish sunk in the crust
15501 Crust determined finely cracked somewhat powdery very white becoming cinereous disk minute concave black powdered with white, Border prominent discoid thin
β Crust thin cracked into areolæ equal dull ash-colored, Fertile areolæ raised in the middle whitish lead-color. disk somewhat concave dark cæsious powdery

† *Thallus adnate uniform* RINODINA.
* *Disk of apothecia constantly dark and black.*

15502 Crust with a somewhat decided edge granulated and cracked greyish-white, Disk of the apothecia plane at length swelling and black the margin free raised, at length waved and crenulate
15503 Crust smooth uneven warted pale, Warts at length subimbricated somewhat lobed and deformed, Disk of the fructification concave brownish-black the border sharp crenulate contracted
15504 Crust glab papill and branch white, Apothecia scss scattered disk slightly concave black, marg tumid
15505 Crust effuse thin cracked rugose unequal cinereous, Disk of apothecia somewhat immersed finally elevated flat dark with an elevated inflexed powdery border
15506 Crust thin somewhat leprous and dispersed whitish, Disk of apothecia plano-convex dark dotted rough, Border obscure powdery
β Crust uneq obscure cinер. black Apothecia min aggreg flat with a white cren border and brown. edge

** *Disk of apothecia black, naked, brownish when moistened*
15507 Crust verrucose-granular from cinereous brownish-green, Apothecia heaped with a flat coarse dark disk brown when moistened, Border tumid inflexed entire

*** *Disk of apothecia black, brown, brownish, or clouded with other colors, naked.*
15508 Crust cartilaginous smooth, at length granulated unequal white or greyish, Disk of the apothecia plano-convex brown or almost black, margin tumid entire, at length waved and crenate
15509 Crust tessellated with tumid warts yellow green or grey, Apothecia appressed, at length irregular with the disk plane or swelling red brown, at length rising above the entire margin
15510 Crust tartareous very much cracked variegated with black and white (yellowish-white in dispersed tumid warts), Apothecia pale-brown, at length convex dark-brown. margin white
15511 Crust effuse thin powdery cinereous æruginous, Apothecia minute appressed. disk flat becoming convex pale-brown, Border thin obscure
15512 Crust thin leprose white, Apothecia crowded elevated disk plane olive, the margin waved
15513 Crust unequal granular somewhat warted pale-green, Apothecia clustered disk flat pale-brown and variegated, Border raised inflexed finally crenulate
15514 Crust effuse very thin polished whitish sometimes bearing soredia, Apothecia sessile; disk flattish pale livid-brown, Border pale becoming crenulate



and Miscellaneous Particulars.

tells us, though generally spelled Parellus. L. Turneri is probably only a variety growing upon the bark of trees.

Lecanora candelaria derives its name from the circumstance of the Swedes employing it to stain the candles that are used in their religious ceremonies.

Lecanora tartarea is the famous Cudbear (so called after a Mr. Cuthbert, who first brought it into use)

History, Use, Propagation, Culture,

employed to produce a purple for dying woollen yarn, and no where, perhaps, used to so great an extent as in the manufactory of Mr Mackintosh, at Glasgow The manufacturers import it largely from Norway, where

15515 Crust cracked and arcolate somewhat granular whitish, Disk of apothecia rufous becoming brown, Border white or yellowish becoming flexuose

**** *Disk of apothecia black, cæsious, glaucous, or variously colored, always prunose*

15516 Crust greenish ash-color with roundish warts, Circumference fibrous, Apothecia mixed disk concave becoming flat blackish-glaucous, border elevated thick

15517 Crust tartareous tessellated even greyish-white, Apothecia immersed in the crust the disk plane, at length convex subglobose glaucous and powdery, margin entire afterwards obliterated

15518 Crust cartilaginous membranous whitish ash-color, Apothecia clustered minute disk flat becoming convex variegated with brown and black, border entire naked persistent

β Crust becoming unequal somewhat granular ash-colored or blackish, Apothecia much clustered disk flat brown and black, border crenulate powdery

15519 Crust thin leprous continuous cream-colored somewhat polished, Apothecia sessile whitish-buff uneven with a thin white wavy border

***** *Disk of apothecia somewhat flesh-colored, pale, testaceous, waxen, or orange-colored*

15520 Crust granulated or somewhat warted white, Apothecia thick crowded by pressure angular the disk concave, and as well as the tumid entire margin of the same color as the crust

15521 Crust very thin membranaceous smooth glaucous white bearing awl-shaped bristles, Disk of the apothecia at length spreading plane pale-yellowish

15522 Crust leprous granular powdery whitish-grey, Apothecia scattered thick powdery disk concave pale flesh-colored, border tumid entire and flexuose

15523 Crust thin polish hoary, Apothecia somew imm disk flat fleshy-vell, border thin somew inflex crenat

15524 Crust tartareous with clustered granules greyish white, Apothecia scattered disk plano-convex a little wrinkled flesh-color, the margin inflexed, at length waved

β Crust thin glaucous white running out into papillæ and spinuliferous branches [becoming black

15525 Crust granul emer Disk of apothecia flat convex yellowish wax-colored, border elevated inflexed hoary

15526 Crust leprous-tartareous granular powdery dirty-white, Apothecia scattered disk waxen covered by the powdery inflexed border becoming convex and dilated

15527 Crust granulated bright-yellow, Apothecia crowded the disk plane of the color as the crust, at length convex deeper colored and powdery, the margin elevated thin, at length waved pulverulent

15528 Crust granular unequal dirty-yellow, Disk of apothecia flat becoming convex somewhat orange-colored, border thin crenulated becoming entire and flexuose

15529 Crust cracked subrugose greenish-yellow, Apothecia at length subglobose deep orange shining when the entire margin becomes obliterated

****** *Disk of apothecia red, scarlet, or purple, and sanguine*

15530 Crust submembranaceous smooth, at length unequal pulverul and granular white, Apothecia crowded the disk concave red, margin tumid inflexed crenulate

15531 Crust tartareous pulverulent whitish, Apothecia imbedded scattered subconfluent the disk scarlet rather convex, the margin sometimes obliterated

β Crust tartar granul powd whit Apothecia sess disk flat deep sanguine, bord elevat thick rug persist

†† *Thallus adnate, radiate, stellate, and lobed in the circumference* PLACODIUM

15532 Crust plaited and wrinkled white the circumference smooth lobed, Disk of the apothecia at length rather convex brownish-black the margin thin entire

15533 Crust somewhat imbricated white, Lobes somewhat concave flexuose cut-crenate, Disk of apothecia flat yellowish-brown border elevated tumid

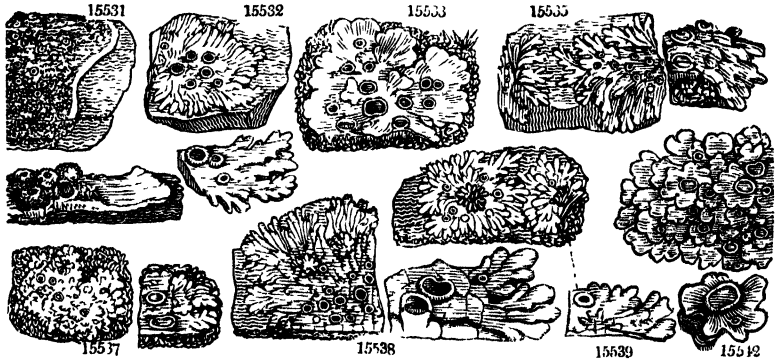
15534 Crust subimbricated scaly somew rugose uneven pallid-green radiated and lobed in the circumference fructification extremely crowded, the disk plane yellowish-brown or subochraceous with a border, at length crenate waved

15535 Crust plaited and lobed cracked bright-yellow orange pulverulent the circumference plicate and rayed, segm lin convex cut, Apothecia crowd disk at length convex of a deeper orange, marg ent waved

15536 Crust somew imbricated plaited and rugose tawny orange naked, Lobes lin lanc waved convex somew distant radiating, Disk of the apothecia concave of the same color with the crust marg somew inflex ent

15537 Crust somew contiguous pale yellow with a plaited lobed edge, Lobes flexuose flat, Apothecia scattered, Disk very red plano-convex

15538 Crust cracked greyish plaited and rayed in the circumference lin-lacinate, Apothecia much crowded at at length angular disk plane brownish black even with the margin of the crust



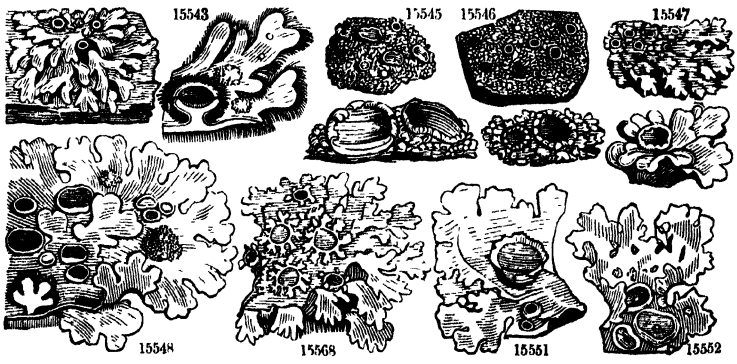
15539 Crust cracked pale reddish grey the circumference rayed and lobed having brown warts in the centre cracked and rayed disk of the apothecia depressed reddish margin thick elevated entire

15540 Crust subimbricat rugulose whitish lobed and cren at the circumference fructification crowd angular, the disk plane brownish flesh-color prunose with a raised and at length crenate flexuose border

††† *Thallus imbricated throughout*

15541 Crust with lobed scales of a brownish ash-color disk of the apothecia immersed nearly plane blackish brown with the margin at length prominent

15542 Crust scaly greenish, Lobes imbricated inciso-crenate waved irregular, Disk of the apothecia slightly swelling brownish orange margin thin entire at length obliterated



and Miscellaneous Particulars

it grows more abundantly than with us, yet, in the Highland districts, many an industrious peasant gets a living by scraping this Lichen with an iron hoop, and sending it to the Glasgow market When I was in the

History, Use, Propagation, Culture,

neighbourhood of Fort Augustus, in 1807, a person could earn fourteen shillings per week at this work, sell the material at three shillings and fourpence the stone of twenty-two pounds The fructified specimens reckoned the best.

15543 Crust somewhat scaly greenish ash-colored becoming powdery, Lobes repand cut wavy with irregular margins, Disk of apothecia flat brownish black
15544 Crust scaly yellow, Lobes very much crowded cut and laciniated imbricated their margins minutely granular, Apothecia nearly of the same color as the crust margin elevated entire
β Crust formed of lobes with many crowded teeth and segments greyish yellow, Apothecia crowded waved: disk plane dilated of the same color as the crust at length fulvous and the margin crenulated
15545 Crust scaly greenish-brown, Lobes minute somew rounded with margin granular and crenulat Apothecia submembran · the disk concave at length dilated plane reddish brown the marg elevated inflex crenate
15546 Crust imbricated greyish lobed and granulated ash-colored brown, Apothecia imbedded in the crust crowded irregular disk rather convex red-brown the margin elevated crenulated persistent
15547 Crust imbricated greyish, Lobes minute appressed blunt, Disk of the apothecia plane black margin elevated and crenate

† *All the divisions of the thallus equal at end*

15548 Thallus cartilaginous rigid obicular livid and glaucous smooth bearing dark green scattered tufted excrescences tawny beneath and downy, the lobes waved and laciniated angular, Apothecia reddish brown rugose at the margin
15549 Thallus orbicular pale yellowish green rugose at length granulated black and hispid beneath the lobes waved laciniated round nearly entire, Apoth scatter brown their margin incurv entire at length pulverulent
15550 Thallus roundish subcoriaceous white smooth finely dotted with black hispid beneath Lobes longish sinuate-crenate cut, Apothecia rufous brown
15551 Thallus orbicular greyish white smooth blackish brown and hairy beneath, Lobes rounded cut plane their margin waved entire, Apothecia brown their margin thin entire
15552 Thallus orbicular glaucous green naked with black fibres on the under side, Lobes rounded cut flat somewhat plaited at the edge, Apothecia rufous
15553 Thallus orbicular membranaceous bright green above, beneath pale brown almost white and downy, Lobes waved and cut, the segments rounded subcrenate, Apothecia red, the margin inflex rugose and crenate
15554 Thallus orbicular membranaceous finely rugose glaucous green, beneath blackish brown fibrous, Lobes cut rounded lax plaited entire
15555 Thallus orbicular olive brown rugged with elevated points paler beneath and fibrous, Lobes radiating appressed plane dilated rounded and crenate, Apothecia dark-brown the margin crenulated
15556 Thallus orbicular bright yellow beneath paler and fibrillose, the lobes radiating appressed plane dilated round crenate and crisped at the extremity, Apoth of the same colour as the crust their margin entire
15557 Thallus orbicular somewhat membranous contiguous plaited umber-olive colored cut crenate in the circumference with flat somewhat truncate lobules
15558 Thallus orbicular cinereous powdery beneath white with black fibres, Central segments plaited eroded crisp powdery at edge, Apothecia concave blackish brown
15559 Thallus orbicular white hoary granular powdery beneath of the same color with obsolete blackish fibres, Segments of the circumference flat cut crenate, Apothecia appressed flat brownish black
15560 Thallus orbicular membranous glaucous ash-colored blackish brown beneath, Lobes sinuate-cut, the end ones rounded crenated, Apothecia brownish with an entire edge
15561 Thallus orbicul cinereous, Soredia grey margined, beneath brownish spongy and fibrous, Lobes concrete plaited those of the circumference rounded cut crenate, Apothecia red with a tumid edge
15562 Thallus orbicular yellowish white pulverulent greyish black and downy beneath, Lobes imbricated plane rounded slightly crenated, Apothecia reddish ("of the same color as crust") their margin pulverulent
15563 Thallus orbicul blueish-grey, beneath having a very thick spongy down, Lobes of circumference rounded and crenate, Apothec scattered at length convex rusty-brown, their margin of same color and entire
15564 Thall orbic brownish-grey, beneath having a blueish-grey spongy down, Lobes of circumf obtusely notched elevated pale, Apothecia plane crowded central reddish-brown with tumid incurv crenul whit margins
15565 Thallus orbicular dark purplish-brown shining dotted with black, beneath black and fibrillose the segments sinuate-multifid linear plane truncated crenate in the circumference, Apothecia dark-brown, the margin slightly crenulate
15566 Thallus orbicul greyish rough and pitted beneath black and fibrillose the segments imbricated sinuated plane subretuse, Apothecia bright chesnut-brown, their margin subcrenulated
15567 Thallus orbicular pitchy-brown smooth beneath black and scarcely fibrillose the segm sinuated multifid divergent plane or slightly grooved, margins elevat lacerat Apothec dark-brown, margin granulated
15568 Thallus stellated shining pitchy-black, beneath black and almost naked the segments nearly linear multifid and somewhat palmate convex, the margins and extremity recurved, Apothec of the same color at length black with the margin crenated
15569 Thallus orbic tawny-brown paler beneath with blackish fibres the segment multipartite nearly lin convex, those of the circumfer dilated nearly plane and crenate, Apothecia dark-brown, their margin crenated
15570 Thallus stellat pale-grey, beneath black uneq naked the segments often uniting convex and almost round lin multifid roughish dotted with black, Apothecia reddish-brown, their margin somewhat crenulated
15571 Thallus stellat pale-greenish bear powdery warts, beneath black with spongy fibres segments of circumference multifid very narrow convex and almost rounded, Apothecia reddish-brown, marg nearly ent

and Miscellaneous Particulars

2341 *Parmelia* Named from παρμη, a sort of small shield, and ωλεω, to enclose On the thallus of these plants scattered powdery warts are commonly found These Hedwig has determined to be anthers, apparently for no other reason than that they are powdery, and that he could fix the title to nothing better.

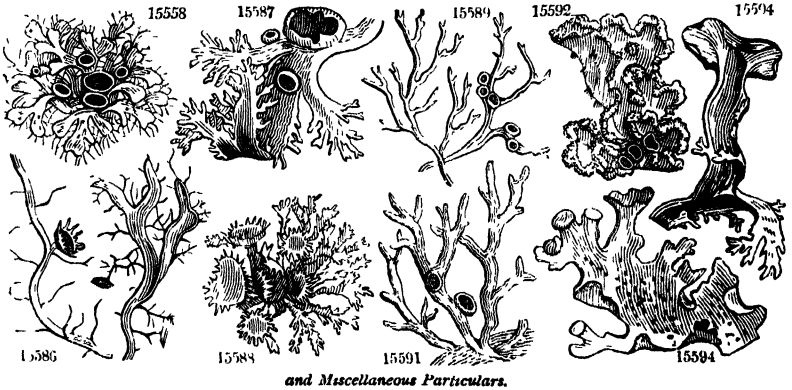
History, Use, Propagation, Culture,



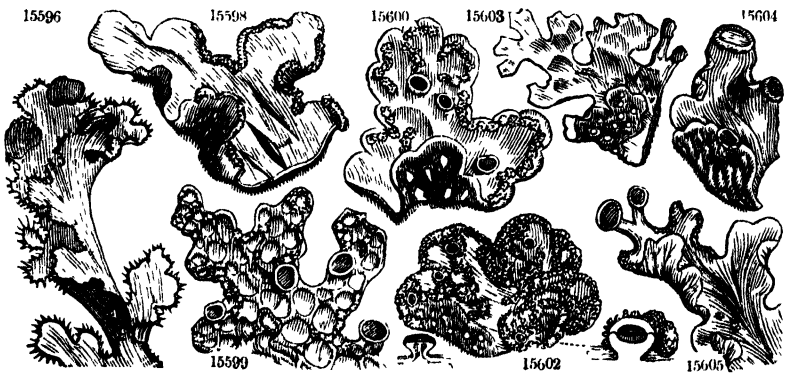
2342. *Borrera* Dedicated by Acharius, to Mr William Borrer, F L S, one of our most eminent British cryptogamic botanists This genus is very natural in habit, including the Linnean genus Lichen and its allies

2343. *Cetraria* An unexplained name. C islandica is common in Iceland and in the north of Germany, and is also found in the mountains of Asturias It grows to the height of two or three inches only, and has a rugged bushy aspect. In Iceland and Lapland it is used as an article of diet, being boiled in broth or milk, after being freed from its bitter by repeated maceration in water, or dried and made into bread It has of late years been brought in considerable quantities to this country for medicinal purposes The dried plant differs very little from its appearance in a recent state Medicinally it is tonic and demulcent, it has also been found useful in debilities after acute diseases, and in emaciations, particularly those arising from the great discharge

15572 Thallus stellat pale-yellowish grey smooth, black and fibrous beneath segments broadly lin sinuato-pinnatifid, their sinuses broad and circular, Apothecia nearly plane dark-brown, their margin thin entire
15573 Thallus orbicular continuous rugose pale-grey pulverulent, beneath of the same color with blackish fibres segments in the circumference distinct plane rounded waved incise-crenate, Apothecia plane reddish-brown, their margin at length crenulate and pulverulent
15574 Thallus stellated pale-yellow green smooth bearing powdery warts, beneath brownish-black and fibrillose the segments linear appressed plane dichotomous somewhat truncated, Apothecia subcentral small nearly plane brown, their margin entire
15575 Thallus orbicul greenish-yell smooth with blackish dots, brown and fibrillose beneath segments sinuato-lobate rounded crenate nearly plane, Apothecia central chesnut-brown with the margin nearly entire
15576 Thallus stellated glabrous greenish-white, beneath snowy-white with greyish fibres the segments imbricated linear plane cut and branched crenate, their extremities ascending and powdery, Apothecia central brown with a tumid singularly rough and crenate border
15577 Thallus stell smooth greyish-white, beneath black and fibrillose segm multif lin broader upwards cut divaricated acute in the circumfrence frequently bearing powdery warts, Apothecia concave chesnut color with the margin entire
15578 Thallus stellated deep glaucous green cæsious and prunose when dry, beneath black and downy and hispid the segment linear multifid in the circumference plane appress waved retuse at the extremities, Apothecia glaucous black, the margin entire and waved at length leafy
15579 Thallus stellat at length rugged and granulat greyish-green, beneath with grey fibres the segm sublin rather convex cut multifid, Apothecia glauc black, their margin entire, at length waved and crenate
15580 Stellate greyish-white and glaucous sorediferous, ash-colored beneath with black fibres segments linear cut multif convex but plane at extremities fructification subconcave black with a subinflexed border
α Thallus stellate cinereous segments branched separate recurved at edge roundish, some broader than the rest and powdery at the edge
15581 Orbicular greenish-grey, fibrous and black beneath, Lacinia imbricated nearly plane multif erosa-crenate somewhat ciliate the margin sometimes raised, fructification very dark, the border raised entire
15582 Crust blueish-white tartareous minutely undulated, Apothecia clustered somewhat sunk disk flat black or brown, margin thick externally black
15583 Thallus substellated glaucous white beneath brownish black, the segm sinuato-multifid convex glabrous inflated and ascending at the extremity, Apothecia red brown, their margin entire
15584 Thallus substellate greyish-green beneath rugose blackish and white, segments sinuato-multifid nearly plane smooth bearing powdery warts and perforated, the extrem inflated, Apoth redd marg. entire

15585 Thallus greyish white naked on both sides and of the same col substellat segm pinnatif ascend dilat. arched and ciliated at the extremity, Apothecia scattered disk plane cæsious black, its marg entire
15586 Thallus palish segments erect linear multifid attenuated ciliated beneath very white powdery and channelled, Apothecia with a flat black cæsious disk
15587 Thallus greenish-grey tartareous the segments linear attenuated branched grooved naked rugose and blackish beneath, Apothecia somewhat margined cup-shaped with their margin thin inflexed
15588 Thallus yellow naked and of the same color on both sides segments linear flattish pinnatifid branched fibrous at end, Apothecia somewhat terminal with an orange-colored disk
15589 Thallus yellow naked segments dichotomously branched slightly compressed attenuated divaricated complicated, Apothecia scattered their disk plane orange-red, their margin entire naked
15590 Thallus greenish segments linear branched attenuated ciliated at end whitish and channelled beneath, Apothecia somewhat terminal disk concave becoming flat with a fringed border
15591 Thallus pale rufous downy segm divaricating tortuous linear tapering channelled on the under surface, Apothecia scattered. disk flattish brownish-black with a thin entire border

15592 Thallus pale-yellow very yellow beneath the segments plane ascending erose crenate and crisped, Apothecia elevated their disk brown, the margin crenulated
β Thallus with segm depressed the lobes rounded crenate, margins crisped pulverulent and very yellow
15593 Thallus olive-brown paler beneath, the segments plane ascending lobed waved sinuate crenate, Apothecia elevated of the same color their margin rugose and crenulate
15594 Thallus glaucous somewhat shining sinuated and lobed brown beneath the segments cut and jagged curled ascending, Apothecia elevated chesnut-brown their margin wrinkled
β Thallus white on each side or with occasional black spots beneath



and Miscellaneous Particulars.

of ulcers, and diarrhœas, dysentery, and hooping cough Its virtues, however, have been greatly overrated. (*Thom Lond Disp* 365)

Though plentiful with us, it is scarcely sufficiently so to form an article of commerce A great proportion of what comes to our shops, where it is in great request as a medicine in coughs, consumptions, &c is procured from Norway or from Iceland Immense quantities are gathered in the latter country, not only for sale, but for home consumption, as an article of common food The bitter and purgative quality being extracted by steeping in water, the lichen is dried, reduced to powder, and made into a cake, or boiled and eaten with milk, and eaten with thankfulness, too, by the poor natives, who confess "that a bountiful Providence sends them bread out of the very stones" An ample account of the nutritive qualities of this plant may be found in the Memoir of Professor Proust, inserted in the Journal de Physique, for August, 1804

History, Use, Propagation, Culture,

2344 *Sticta.* From στικτος, dotted, on account of the numerous little pits on the under surface of the fronds. One of the most handsome genera of Lichens, growing almost wholly upon trees. Sticta pulmonacea is supposed to possess the same qualities as the famous Iceland moss, Cetraria islandica.

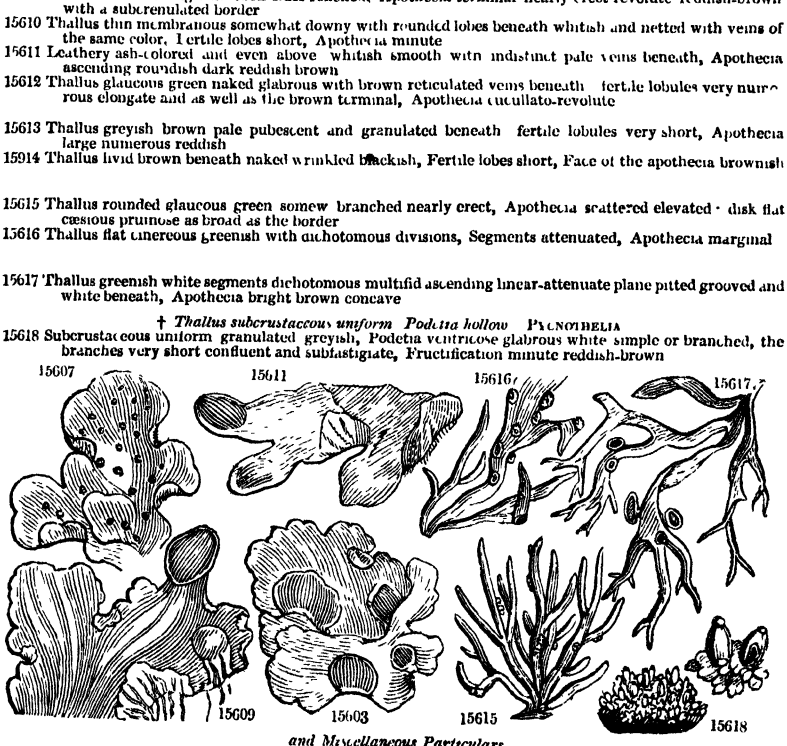
2345 *Peltidea* So called in allusion to the form of the shields, from πελτη, a target. Peltidea aphthosa, a large handsome species, has its name from the circumstance related by Linnæus, that the Swedish peasants boil it in milk as a cure for the aphtha, or thrush, in children

2346. *Nephroma* From νεφρος, a kidney, the apothecia are of a reniform figure N. polaris is remarkable for being common to both the arctic and antarctic circles

2347. *Roccella* This is a slight alteration of the Portuguese *Roccha*, signifying a rock, in allusion to the

15595 Thallus sulphur-colored orange at the base pitted and reticulated erect nearly plane laciniated its segm multifid crisped crenato-dentate and often warted at points, Apothecia plane flesh-col marg crenulat
15596 Thallus olive-brown paler beneath the segments erect sublinear multifid channelled smooth dentato-ciliate, fert. branches spreading, Apothecia appressed plane of the same color margins elevated entire

15597 Thallus dark glaucous brown pitted with broad rounded spreading entire lobes, having bright lemon-colored powdery spots upon the margin and on the elevated parts between the pits downy and tawny beneath with min lemon-colored little hollows, Apothecia scattered black.-brown their margin entire
15598 Thallus glaucous shining very broad woolly beneath, Soredia minute yellow segments rounded sinuated cut, margin wavy crisp inflexed yellow-powdery
15599 Thallus olivaceous pitted and reticulated downy beneath with smooth prominences the segm sinuato-lobate truncated, Apothecia submarginal plane reddish · their margin rugose
15600 Thallus suborbicular glaucous greyish-green very broad somew pitted and having mealy warts beneath downy tawny with white naked spots, the segments rounded and lobed irregular, Apothecia scattered nearly plane reddish-brown their margin somewhat crenate
15601 Thallus orbicular glaucous brown roundly lobed smooth grey and powdery at the margin downy beneath with white hollow spots, Apothecia brown
15602 Thallus orbicular dark lurid-grey rough with brown granules beneath grey-brown with white concave spots, the segments roundly lobed nearly entire, Apothecia scattered dark-brown their marg entire
15603 Thallus wide rusty brown naked and pitted brown and downy beneath with small pale excavations, segments lobed and obtusely cut unequal, Apothecia marginal dark-brown



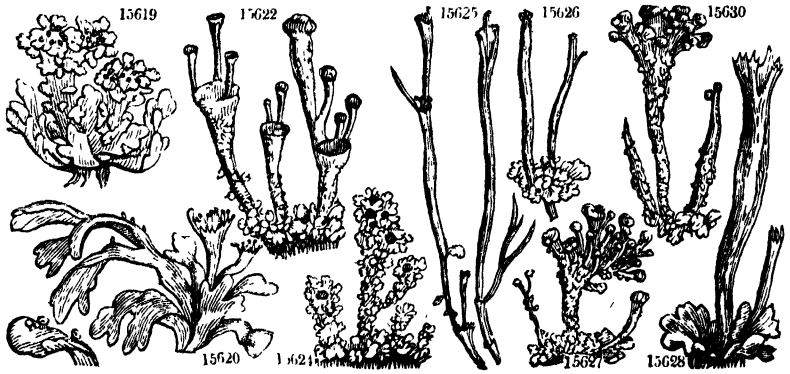
15604 Thallus greenish ash-color white beneath having dark brown prominent branched veins, Lobes rounded cut somewhat entire Apothecia marginal plane rounded swelling brown scarcely crenulate at the margin
15605 Thallus ash-colored whitish and veiny beneath the lobes roundish sinuated and cut crenate and crisped, fertile lobules very short, Apothecia orbicular ascending nearly plane brown somewhat entire
15606 Thallus glaucous and brownish green lobed crenate and shining pale beneath with numerous brown branching reticulated veins fertile lobules abbreviated, Apothecia terminal plane horizontal transversely oblong reddish brown with a nearly entire margin
15607 Thallus green smooth roundly lobed sprinkled with brown warts whitish beneath with brown branching veins · fertile lobules very long contracted in the middle their sides reflexed, Apothecia terminal large ascending red brown with a lacerated margin
15608 Thallus coriaceous concave even dark reddish-brown pale downy with obsolete veins beneath, Lobes rounded with numerous fruit-bearing processes
15609 Thallus greyish green with broad rounded lobes white beneath with brownish branching veins fertile lobules rather long with their sides reflexed, Apothecia terminal nearly erect revolute reddish-brown with a subcrenulated border
15610 Thallus thin membranous somewhat downy with rounded lobes beneath whitish and netted with veins of the same color, Fertile lobes short, Apothecia minute
15611 Leathery ash-colored and even above whitish smooth with indistinct pale veins beneath, Apothecia ascending roundish dark reddish brown
15612 Thallus glaucous green naked glabrous with brown reticulated veins beneath fertile lobules very numerous elongate and as well as the brown terminal, Apothecia cucullato-revolute

15613 Thallus greyish brown pale pubescent and granulated beneath fertile lobules very short, Apothecia large numerous reddish
15914 Thallus livid brown beneath naked wrinkled blackish, Fertile lobes short, Face of the apothecia brownish

15615 Thallus rounded glaucous green somew branched nearly erect, Apothecia scattered elevated · disk flat cæsious pruinose as broad as the border
15616 Thallus flat cinereous greenish with dichotomous divisions, Segments attenuated, Apothecia marginal

15617 Thallus greenish white segments dichotomous multifid ascending linear-attenuate plane pitted grooved and white beneath, Apothecia bright brown concave

† *Thallus subcrustaceous uniform Podetia hollow* PYCNOTHELIA
15618 Subcrustaceous uniform granulated greyish, Podetia ventricose glabrous white simple or branched, the branches very short confluent and subfastigiate, Fructification minute reddish-brown



and Miscellaneous Particulars.

places where this plant is commonly found This plant is the Orchall or Argol of the dyers, so celebrated for yielding a fine purple color, for which Cudbear is but a poor substitute.

2948. *Evernia* Εὐέρνης signifies tall, or well branched. The name has been well contrived to express the habit of the species, which all form bushy, erect, or pendulous tufts.

2949 *Cenomyce.* From κενος, empty, and μυκης, a minute fungus, alluding to the hollowness of the little fungus-like receptacles Cenomyce rangeferina this is the Lichen which, for the greater part of the year, and especially in winter, is the support of the vast herds of rein-deer, in which consists all the wealth of the Laplanders No vegetable, Linnæus tells us, grows throughout Lapland in such abundance as this, especially in woods of scattered pines, where, for very many miles together, the surface of the sterile soil is covered with it as with

History, Use, Propagation, Culture,

snow On the destruction of forests by fire, when no other plant will find nutriment, this Lichen springs up and flourishes, and, after a few years, acquires its greatest size Here the rein-deer are pastured, and whatever may be the depth of snow during the long winters of that climate, they have the power of penetrating it, and

†† *Thallus foliaceous Podetia fistular dilated upwards and fertile, or sterile and subulate Apothecia closed with a membrane* SCYPHOPHORA.

* *Apothecia fuscous or pallid.*

15619 Thallus foliaceous very pale glaucous green the segments subpalmated ascending obtuse and incurved, Podetia elongated turbinate all cup-bearing smooth the cups regular crenate with the margin at length leafy and proliferous, Apothecia brown

15620 Thallus foliaceous large glaucous yellow green white beneath the segments multifid waved crenate crisped, Podetia turbinate elongate mostly simple, Apothecia marginal reddish-brown

15621 Thallus foliaceous glaucous green segments erect multifid narrow repando-subdentate, Podetia cylindrical short glabrous dingy at length black all of them cup-bearing · cups small regular dilated entire nearly plane proliferous from the centre, Apothecia marginal sessile brownish-black

15622 Thallus foliaceous segments crenulated ascending, Podetia all turbinate elongate cup-shaped glabrous at length granulat warty rough grey green cups regular, the margin at length prolifer Apoth brown

15623 Thallus foliaceous · the segments small crenate, Podetia elongate cylindrical cup-bearing sometimes subulate slightly pulverul white cups regular their margins ent. and crenat. at length prolifer Apoth brown

β Podetia elongated powdery white, Scyphæ radiant at edge

γ Podetia elongate subulate simple or branched pulverulent white sterile or with reddish apothecia

15624 Thallus foliaceous, Segments broadish crenulate cut, Podetia longish smooth somewhat warted glaucous or whitish green, Apothecia irregular torn into rays proliferous at edge

β Thallus foliaceous ash-colored brittle segments imbricated minute crenate, Podetia cylindrical rough and foliaceous cups turbinate closed at length dilated and radiated, Apothecia marginal sessile or stalked brownish-black

15625 Thallus foliaceous, Segments small crenate, Podetia long subulate sterile and fertile smooth livid-brown, Apothecia cup-shaped toothed at edge occasionally proliferous

β Thallus foliaceous very minute, Podetia elongate subulate sterile and cup-bearing smth greenish brown: cups toothed at the margin at length proliferous, Apothecia brown

** *Apothecia scarlet or deep red*

15626 Thallus foliaceous small segm meriso-lobate crenate, Podetia cylindr simple and somew. branch at the extremity greenish white granulated rarely cup-bear, cups narr at length radiat Apoth minute scarlet

15627 Thallus foliaceous small segments expanded rounded crenate beneath as well as on the cylindrical yellow green cup-bearing, Podetia pulverulent cups narrow small at length large with the often branched numerous digitate or rayed prolifications tipped with the bright scarlet apothecia

15628 Thallus foliaceous minute segments broadish cut crenate naked beneath, Podetia long thick subventricose sulphur-colored slightly pulverulent cup-bearing cups narrow crenato dentate at length dilated and jagged, Apothecia sessile and pedunculate scarlet

15629 Thallus foliaceous minute segm rounded crenate nak beneath, Podetia elongated turbinate naked nearly pale yellow or greyish green all cup-bearing, cups with their margins spreading fertile, Apothecia large at length stalked scarlet

β Pode rather short cup-bearing cups dilat. crisp and foliac term by the scarlet stalk Apoth at leng prolif.

15630 Thallus foliaceous minute the segm meriso-crenate naked beneath, Podetia elongate cylindr rigid glabr foliaceo-squamose pale all cup-bear cups narr their margins fertile and prolifer Apoth crowd scarlet

††† *Thallus foliaceous Podetia fistular dilated upwards and fertile Apothecia pervious* SCHISMARIA

15631 Thallus foliac minute lobed and crenated, Podetia elongated branch. subventr granulat rough with leafy scales cup-bearing cups irregular pervious dentato-radiate proliferous, Apothecia stalked pale brown

†††† *Thallus foliaceous Podetia somewhat fistular, cylindrical, simple, split at end or digitate. Rays all fertile.* HELOPODIA

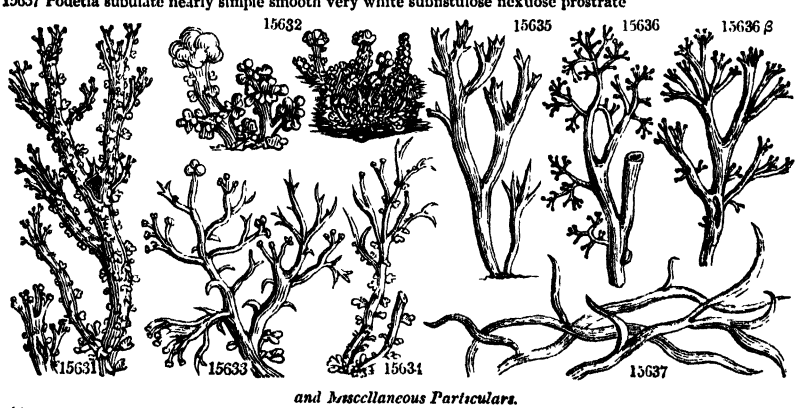
15632 Thallus foliaceous with minute granular lobes, Podetia smooth granular pallid divided at end: divisions very short, Apothecia clustered brownish black

††††† *Thallus foliaceous, scarcely any Podetia cartilaginous, rigid, fistular, all tapering subulate branched. Axillæ generally bored through* CLADONIA

15633 Podetia elongated smooth at length scaly greenish white inflated curved branched, Branches lax subsecund their extremities divergent spinulose, Apothecia pale brown

15634 Podetia elongated smooth livid brown dichotomous, Axils not perforated, Branches narr. subulate curved the extremities forked divergent · fertile ones with brown apothecia

β Podetia elong slender sparingly branch Branches nearly erect fertile bran with brown capitate apoth



15635 Podetia elongate glabr pale dichotomous the axils perforated open, extremities of the branches patent short acute and rigid, Apothecia small terminal brown

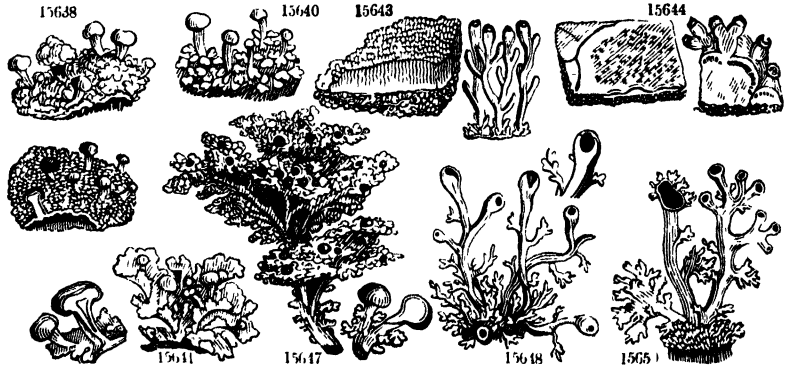
15636 Podetia elongate cylindr erect roughish hoary branched axils often perforated, Branches scattered very much divided spreading the ultimate ones subradiate or drooping, Apothecia subglobose clustered brown

β Podetia cinereous dichotomously branched rigid forming a cushion-like tuft, Axillæ not bored through, End of branches mucronate diverging brownish

†††††† *Thallus none Podetia soft, subsolid, subulate, somewhat branched Axillæ not bored through* CERANIA.

15637 Podetia subulate nearly simple smooth very white subfistulose flexuose prostrate

and Miscellaneous Particulars.



obtaining their necessary food Linnæus has given a beautiful description of this Lichen, and of the animals whose support it is, in the Flora Lapponica, p 332

History, Use, Propagation, Culture,

2350 *Bæomyces* From βαιος, small, and μυκης, a fungus, a name well applied to this genus, which much resembles some minute kinds of Agaricus or Helvella

2351 *Isidium* From ισος, equal, in allusion, we presume, to the small difference which exists in size between the podetia and the substance of the frond

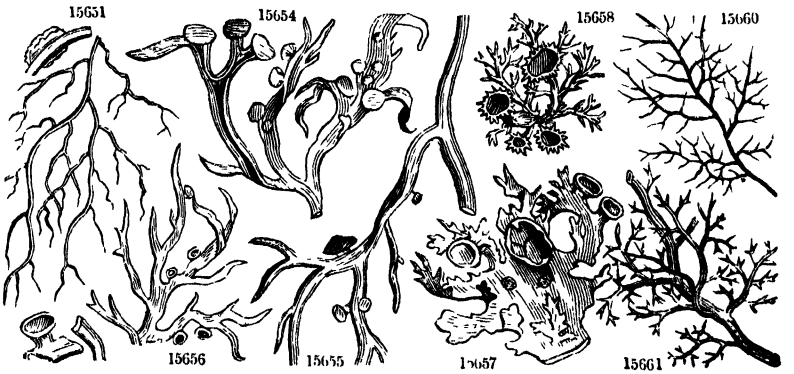
2352 *Stereocaulon* From στερεος, hard, and καυλος, a stem, a name well adapted to express the peculiarities of this genus Its firm branching frond is fitted to occupying the interstices of crumbling granite, and the cells of volcanic scoriæ. It is the first of its tribe which clothes the lava of volcanoes in a state of decay

2353 *Sphærophoron.* From σφαιρα, a globe, and φερω, to bear, in reference to the globular fructification The most elegant genus of Lichens, at once known by its branched bushy smooth habit, like that of a coralline.

15638 Crust unif granulat. greenish white, Podetia very short cylindr. Apoth. subglob wrinkl. pale flesh-color
15639 Crust uniform rugose granulat and pulverulent greenish white, Podetia very short somewhat compressed, Apothecia flattish at the top sometimes conglomerate reddish brown
15640 Leaves minute somewhat imbricated rounded nearly entire, Podetia simple tubular smooth
15641 Thallus clustered ascending leafy pinnatif cut and crisped . bright green above , white beneath, Tubercles from the disk of leaves convex reddish brown

15642 Crust tartareous cracked smoothish nearly even of a brownish cream-color thinner towards the edges, Podetia scattered short hemispherical simple of the same color as the crust, Apothecia brownish
15643 Crust tartareous greyish white, Podetia at length elongat round. simple or branch Apoth brownish-grey
15644 Crust tartareous thin unequal cracked and greyish, Podetia subglobose at length cylindrical simple and branched, Apothecia dark-brown
15645 Crust cracked areolate warty a little powdery unequal pale sulphur-color, Podetia becoming cylindrical simple and branched, Apothecia yellowish brown
β Crust powdery sulphureous-green, Podetia roundish of the same color, Apothecia pale yellow
15646 Crust somewhat cracked powdery and hoary, Podetia subglobose papillæform very close together, Apothecia brown hoary

15647 Thallus greyish branch and rough with granulat. excrescences, Branches crowded and very much divided, Apothecia scattered and terminal at length convex conglomerate blackish brown



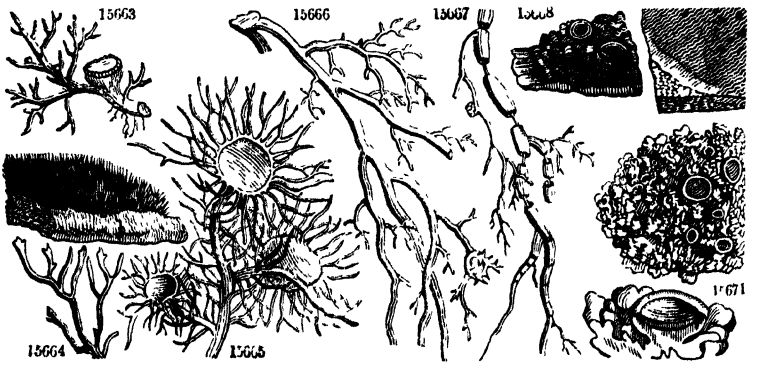
15648 Thallus pallish-brown, Branches lateral elongate lax divaricat and forked acumi Apoth subglobose smth
15649 Thallus greyish branched, Branches dichotomous short crowded fastigiate naked rounded rather obtuse, Apothecia globoso-turbinate somewhat warted
15650 Thallus whit branch Branc. compress ramulose subfibrill naked, Apoth subglob depress and smth above

HOMOTHALAMI.

15651 Thallus rounded somewhat shining livid-brown very much branched, Branches filiform compressed at the axils, Apothecia of the same color, at length convex entire at the margin
β Thallus and subsimple branches flexuose or tortuose complicated rather rigid greyish-black decumbent
15652 Thallus roundish angular somewhat pitted dichotomous pale-yellowish the extremities much branched lax and slender, Apothecia rather concave livid prunose, at length flattened

15653 Thallus plane linear laciniated greyish-white glabrous but rugose and pitted subreticulated · the ultimate branches attenuated, Apothecia mostly marginal plane pale flesh-colored
15654 Thallus compressed glabrous pitted branched glauc white, Branches thickened and fastigiated upwards, Apothecia numerous terminal peltate subsessile white
β Thallus and branches elongated, Branchlets cylindrical attenuated pitted and channelled, Apothecia subterminal appendiculated beneath
15655 Thallus compressed glabrous somewhat pitted branched yellowish-grey, Branches linear attenuated, Apothecia scattered on short stalks of the same color as the thallus
15656 Thallus compressed glabrous somewhat pitted bearing powdery warts rigid branched greyish or greenish-white, Branches linear attenuated, Apothecia scattered on short stalks plane somew margin whitish
15657 Thallus flat somewhat membranous smooth a little pitted white torn, occasionally powdery with dilated flat soredia, Apothecia nearly terminal very large

15658 Thallus deep pitchy-brown rounded or subcompressed smoothish distichously dichotomous, Branches fastigiate black above, Apothecia plano-convex blackish-brown somew marginated entire and toothed
15659 Thallus glabrous chesnut-brown round angular pitted and subcompressed naked, Branches and branchl divaricated flexuose aculeated, Apothecia reddish-brown the circumference somewhat toothed
β Thallus glabrous chesnut-colored plano-compressed somewhat pitted with the margins denticulate, Branches and branchlets short patent attenuated, Apothecia spinose-radiate reddish-brown
15660 Thallus black rounded capill suberect branched, Branches fine short scatter pat · extrem curved grey
15661 Thallus glabrous pale yellowish-white roundish suberect branched, Branches short attenuated blackish at the points, Apothecia brownish pale in the circumference



and Miscellaneous Particulars

2354. *Alectoria*, seems to derive its name from ἀλέκτωρ, unmarried, because nothing has been made out respecting the male flowers A usneoides is a species which grow on trees in warm countries, such as Asia, Africa, and America, hanging down in branches from six to eighteen inches long it was used by the Arabian physicians as a cordial, and also for the purpose of procuring sleep A jubata occasionally supplies the reindeer with food , for which purpose the Laplanders cut down the trees, that the Lichen may be devoured from the topmost branches

2355 *Ramalina* This name does not appear to have any obvious meaning The species are little bushy tufts generally covered with soredia. They are found in all parts of the world upon trees and rocks , but chiefly upon the former

2356 *Connucularia* So called in allusion to the multitude of little horn-like divisions into which the thallus is divided. Crustaceous branched tufts, with a solid axis.

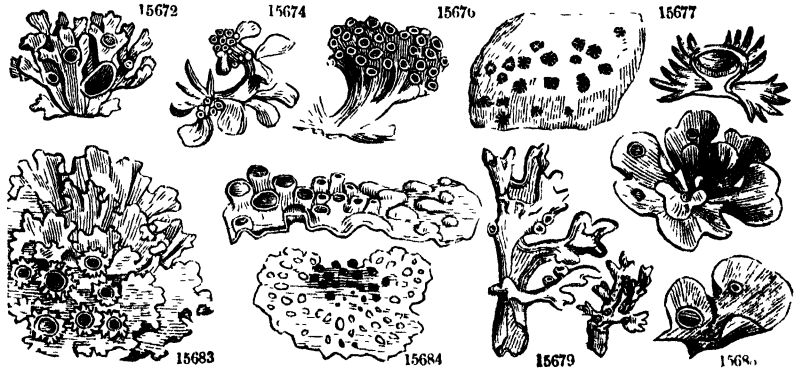
History, Use, Propagation, Culture,

2357 *Usnea.* This word is said to have originated in the Arabic *achneh* or *áchnéa*, which is, according to Golius, the name by which the Arabian physicians designate Lichens in general. Crustaceous branched tufts, usually hanging down from the substances on which they grow.

15662 Thallus decumbent rounded smoothish dichotomous greyish-black, Branches and branchl flexuose intricate forked at the extremity, Apothecia somew margined plane circumference naked and granulated
15663 Thallus decumbent rounded roughish black, Branches intricate capillaceous: the ultimate ones simple, Apothecia of the same color entire in the circumference
15664 Minutely shrubby densely tufted erect entangled cylindrical corymbose black with palish notched tips

15665 Thallus nearly erect roughish greenish-grey with very numerous fine horizontal fibres, Branches patent subsimple, Apothecia plane very broad whitish ciliated the ciliæ radiating long
15666 Thallus pendulous smooth pale, Branches lax much divided subfibrillose the ultimate ones capillaceous, Apothecia plane broad ciliated, Ciliæ slender very long
β Thallus nearly erect somewhat shrubby pale greenish-white very much branched subpulverulent and roughish, Branches very much divided flexuose intricate attenuated subfibrillose
15667 Thallus pendulous smoothish rounded thickish pale greenish-grey, Branches divergent here and there fibrillose capillary at their extremity articulated below
β Thallus glabrous greenish-grey glabrous, Branches elongate dichotomously divided articulated, Articulations swelling distinct ultimate branches capillary fibrillose



† *Thallus crust-like, irregular, or uniform* Placynthium
15668 Thallus crustaceous roundish brown-black lobes of the circumference cut crenate, central granular a little branched, Apothecia becoming convex black-edged

†† *Thallus imbricated, plaited, roundish, composed of minute lobes, becoming very turgid when wet* Enchylium
15669 Thallus suborbicular imbricated lobes thick, all minute rounded crenulated ascending, Apothecia nearly plane aggregated of the same color as the thallus the margin crenulated subevanescent
15670 Thallus roundish lobes rounded expanded naked thickened at edge crenate ascending, Apothecia scattered minute concave dull yellow-brown, exterior margin tumid and unequal
15671 Suborbicular the central lobes somewhat erect granulated, those of circumference depressed larger obt crenulate, Fructification scattered rather concave reddish with a granulated margin
15672 Suborbicular imbricated lobes thickish flat incumbent roundish cut lobed and crenulate, Apothecia scattered immersed in the lobes and concave rufous with an entire edge
15673 Suborbicular imbricated lobes all thick rounded lobed plaited in circles wavy suberect entire, Apothecia scattered concave whole-colored
15674 Thallus cushion-like formed of thick close blunt complicated lobes, Apothecia somew marginal roundish whole-colored disk urceolate with a double edge
15675 Thallus orbicular somewhat stellated imbricated lobes cut and laciniated, margins elevat waved crisp and crenulated, Apothecia marginal nearly plane of same color as thallus their margin granulated
β Lobes of the thallus deeply laciniated narrow multifid spreading flexuose nearly plane crenate and lobed, Apothecia marginal and scattered dark-brown their margin entire
15676 Thallus suborbicular imbricato-plicate plaits central erect flexuose, Lobes of the circumference rounded meso-crenate, Apothecia marginal turbinate fasciculate disk rather convex reddish
15677 Thallus lobed starry dark green, Apothecium central elevated brownish pink with a paler entire margin
15678 Thallus thick dark-green with elevated intestine-like convolutions

††† *Thallus somewhat foliaceous irregular, formed of naked, expanded, thick, turgid, naked lobes* Scytinium
15679 Thallus subfoliaceous green-brown-glaucous lobes thick close palmate cut, segments somewhat linear round, Apothecia rufous brown
15680 Leafy gelatinous fleshy granulated on both sides of a blackish-olive color, its lobes crowded rounded plaited crisp and cut, Apothecia scattered dark brown
15681 Frond radiating fleshy · segments repeatedly forked fan-shaped crenate convex above concave beneath, Shields prominent at length blackish and flat

†††† *Thallus foliaceous · lobes rounded, downy or fibrous beneath* Mallotium
15682 Thallus foliaceous blackish-green glaucous and downy beneath, Lobes rounded waved entire, Apothecia scattered elevated plane reddish their margin entire
15683 Thallus foliaceous somew imbricated glauc greenish-brown pubescent and somew spongy beneath Lobes rounded sinuated crenulat and crisped, Apoth depressed plainsh brown their margin foliaceous crisped

††††† *Thallus foliaceous · lobes somewhat membranous, lax, naked, dark-green* Lathagrium
15684 Thallus foliaceous membranous submono-phyllous orbicular depressed plaited rounded and lobed black-green, Apothecia central crowded at length convex reddish brown their margin entire
15685 Thallus foliaceous membranaceous smooth blackish-green lobes distinct rounded entire lax waved, Apothecia scattered nearly plane reddish their margin thin entire
15686 Thallus foliaceous membranaceous somew wrinkled complicate blackish-green granulated on both sides lobes round unequal waved and crisp ent Apoth scattered plane dark-brown their margin entire
15687 Thallus foliaceous membr unbr naked black lobes small roundish cut nearly entire suberect plaited, Apoth scattered sessile whole-colored with an entire edge
β Lobes sinuate cut crisp toothletted

and Miscellaneous Particulars.

2358. *Collema* A Greek word signifying a glutinous substance. All the species are gelatinous and are supposed by Fries to be Algæ in a Lichenform state Nostoc cæruleum has been positively stated to be convertible into Collema limosum

History, Use, Propagation, Culture,

2359. ***Lepraria.*** Because the plants upon which these substances grow have the appearance of being diseased with leprosy.

2360. ***Opegrapha*** From οπη, a chink, and γραφω, to write. The shields or apothecia are cracks upon the surface of the thallus resembling Hebrew or oriental characters upon a pale ground

†††††† *Thallus foliaceous : lobes rounded, membranous, thin, naked, cinereous, glaucous, somewhat transparent Apothecia slightly stalked* LEPTOGIUM

15688 Thallus foliaceous membranaceous thin subdiaphanous lead-color obsoletely rugose and dotted lobes rounded somewhat cut, Apothecia scattered subpedicellate plane reddish-brown, their margin pale
15689 Thallus nearly erect foliac membr subdiaphan subrugose with obscure reticulations glauc lobes small subimbr. cut and lacimat. and somew fringed, Apoth scattered rather concave red their margins pale

††††††† *Thallus very finely lacinated and branchletted*

15690 Thallus substellate · the segments very narrow linear appressed very much branched obtuse, Apothecia central nearly plane of the same color as the crust their margin thin entire
15691 Thallus subimbricated : segm minute linear multifid unequal granular acute much clustered, Apothecia scattered fleshy rufous margined
15692 Thallus subcæspitose : segm linear flat irregularly subdivided rugose obtuse, margins repand obsoletely crenated, Apothecia scattered of the same color
15693 Thallus pulvinate brown, Branches rounded nearly erect flexuose uneven subfastigiate rather obtuse, Apothecia nearly terminal plane brown margined
15694 Thallus dull-green segm aggregate branched granular cylindrical obtuse, Apothecia scattered concave brown externally spongy and pale with an erect thin margin

ATHALAMI.

15695 Crust thick pulvin bright sulphur-color composed of a dust-like substance collect into somew hairy glob
15696 Crust spreading equal thin somewhat cracked bright-yellow composed of subglobose granules
15697 Crust not discernible, Fructification of an ochrey-yellow collected into thin scattered patches
15698 Crustac granulated continuous somewhat gelatin. greyish dull-green when dry, bright-green when wet

PSEUDO-LICHENES.

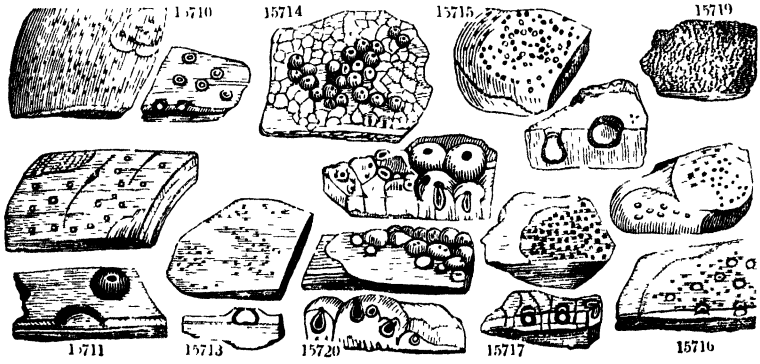
† *Disk of apothecia very narrow, crack-like, somewhat covered in by the conniving tumid margins* HYSTERINA

15699 Crust somew cracked unequal very white, Apothecia clustered minute oval-oblong turgid disk closed
15700 Crust tartareous determined reddish-white, Clefts immersed convex without any elevated border repeatedly branched curved parallel and equidistant
15701 Crust tartareous smoothish cohering uneven whitish, Apothecia innate oblong disk resembling a cleft, at length rugose waved plaited dissimilar rather confluent with the disk irregular somewhat dehiscent
β Crust tartareous or leprose uneven pulverulent, Apothecia roundish dissimilar waved plaited tortuose and variously expanded in the disk
15702 Crust tartareous powdery very white, Apothecia longish straight swelling opaque collected in a stellate manner disk like a crack
15703 Crust very thin brownish-black, Apothecia minute much crowded roundish elliptical, at length rugose irregular disk very narrow
15704 Crust somewhat membranous very finely cracked rugose roughish cinereous-brown, Apothecia minute innate clustered convex elliptical oblong straight with a crack-like disk
β Crust membranous smoothish pale-olive or green and rufous-brown, Apothecia variable roundish oblong straight and curved
15705 Crust between cartilaginous and membranaceous somewhat scaly smoothish greyish-white, Apothecia sessile long or roundish waved somewhat shining with the disk very narrow
15706 Crust very thin of a regular figure polished cinereous, Apothecia innate minute convex rugulose opaque various · smaller dot-like, longer very slender flexuose somewhat branched
β Crust very thin shin pale-olive, Apothecia subellipt simp somew parallel becoming stellate and angular
15707 Crust membranous polished somewhat bordered whitish, Apothecia sessile various the smaller globose or oblong, larger very long narrow roundish flexuose
β Crust regular membranous whitish, Apothecia sessile close together somewhat shining longish flexuose simple and branched disk somewhat channelled

†† *Disk of apothecia concave, channelled, or flat, appearing between the separated margins* ALYXORIA

15708 Crust cartilagin lep white, Apothecia scatter. sess round and oval deform disk flat becoming convex
β Crust cartilaginous membranous dirty-white ash-color, Apothecia variable sessile oblong and tapering at each end opaque disk flat

††† *Thallus cartilaginous, membranous, contiguous, polished* LICOPHLEA



15709 Crust very thin smooth much cracked very black, Apothecia very minute subglobose immersed ; the extremity prominent umbilicated, nucleus blackish

and Miscellaneous Particulars

2361 *Verrucaria.* Thus called, from *verrucа*, a wart, on account of the verrucose nature of the shields. Schrader says, this genus differs from the similar Eudocarpon in having the shields always closed, while the latter explodes its contents by a small but distinct orifice

History, Use, Propagation, Culture,

2362 *Porina* From πωρινος, any thing that crumbles away, a name applied in consequence of the nature of the crust of these plants, which, indeed, is common to them with other Lichens

2363 *Arthonia.* A name, the meaning of which is unexplained The species are similar in habit to Spiloma and Opegrapha.

15710 Crust very thin determined polished brown Apothecia min. hemisph glob without orifices: kernel white
15711 Crust membranous determined shining somewhat olive-colored, Apothecia subsessile scattered hemispherical conoid papillose: kernel compressed somewhat membranous white
15712 Crust exceedingly thin spreading quite white, Fructification minute roundish subelliptical, Tubercles semi-immersed · the interor white
15713 Crust thin cartilaginous membranous polished becoming cracked whitish, Apothecia minute hemispherical clustered subconfluent with scarcely any orifice

†† *Thallus nearly solid, somewhat gelatinous* Blennorina

15714 Crust somewhat gelatinous roundish broken dark crenate cut radiated in the circumference, Apothecia subglobose immersed papillose at end

††† *Thallus subtartareous, crustaceous, contiguous, cracked into areolæ, or powdery* Lithocia

15715 Crust tartar contig whitish, Apothecia minute clustered immersed subglobose dirty transparent inside
15716 Crust tartareous contiguous bordered finely dotted mouse-color, Apothecia minute subglobose immersed with a prominent papilla · dirty-white inside
15717 Crust tartareous contiguous finely cracked subrugose lead-color, Apothecia subglobose innate finely becoming depressed and scutelliform
15718 Crust with the figure of a tree greenish-black bordered, Areolæ nearly separate somewhat branched radiating, Apothecia conoid becoming concave above
β Areolæ of the crust dispersed deformed brownish-black

†††† *Thallus soft, cottony, somewhat spongy, or thin and arachnoid* Inoderma.

15719 Thallus thin somew fibrous uneq. pale-yell Apothecia minute globose immersed with a prominent orifice

15720 Crust equal polished whitish ash colored, Warts of apothecia subglobose, Orifices several depressed black

15721 Crust white powdery and cracked, Tubercles numerous depressed oblong irregular obtuse yellowish-brown clothed with deciduous mealiness
15722 Crust cartilagin membr white, Apoth sess broad tum round rep irreg and confl dark with elevat dots
15723 Crust membr pale cinereous and glaucescent, Apoth flatten upon the crust plane angular substell black
15724 Crust membr somew olive-col. Apoth min flat concav somew membr oval ellipt and remif wrink dark
15725 Crust thin subtartareous equal somewhat cracked white, Apoth clustered flat somewhat immersed round oblong and curved black cæsious

15726 Crust membranac smooth somew shining white or greyish-brown bordered with black, Apothecia half immersed naked flexu simple or branch disk very narr marg formed of the thallus raised membranac
δ Crust effuse membr whitish, Apoth emerging flexuose with a channelled dehiscent cæsious disk with an elevated tumid margin
γ Crust very thin hoary glaucous shining, Apothecia emerging straight long nearly simple acuminate somewhat parallel disk channelled
15727 Crust somewhat cartilaginous unequal very white, Apothecia immersed flexuose branched black branches divergent forked acute, Disk broad flat naked
15728 Crust cartilaginous membranous unequal rugulose of a regular figure white and cinereous, Apothecia immersed long clustered flexuose nearly simple and branched
15729 Crust membranous polished pale-olive, Apothecia clustered nearly simple curved turgid obtuse: disk broad convex cinereous pruinose with a thick powdery white margin
15730 Crust orbicular granular smooth white, Apothecia immersed scattered short straight nearly simple: margin of the perithecium with a longitudinal furrow

and Miscellaneous Particulars

9364. *Graphis* From γραφω, to write The apothecia are extremely similar in form to the characters of some strange language It is very near Opegrapha from which it does not at all differ in habit.

Order 9 FUNGI

Reproductive organs uniform Sporules (e) arranged in tubular cells (f) placed in some parts of the external surface Substance various (g), mostly thick and fleshy, sometimes vesicular Frond none

In speaking of the eighth order, Lichens, it has been observed, that they, Algæ and Fungi, might be considered collateral. But perhaps Fungi should be estimated as still lower in the scale of creation than Lichens From some passages in the writings of a celebrated Swedish author upon Fungi, Mr Fries, whose mode of arrangement is almost entirely adopted here, it would seem as if he considered the three orders to consist of the same beings altered by the material on which they grow, and organized according to the different elements upon which they depend for support Algæ, he observes, which are much extended in their native element, water, when exposed to the air, contract and become Lichens Thus Nostoc muscorum becomes Collema limosum, &c., and Sir James Smith has even decided, that Lichina pygmæa when growing under water is an Alga, and when above water a Lichen But the differences between Fungi and Algæ, or Lichens, are greater, and arise out of their essence, that of Fungi being always reproductive, of Algæ primitive In Algæ, the thallus is the most essential part, and the reproductive organs of secondary importance, in Fungi, the whole plant is generally a mass of reproductive matter, and the thallus always accidental Fungi always grow upon dead vegetable matter, Lichens always upon living vegetation The bark which, when living, bears Lichens, produces Fungi as soon as it begins to decay and even on the same half-dead branch, the living side will be found occupied by Lichens, and the dead by minute Fungi The lowest Fungi are considered by Fries, to bear the same relation to plants as Entozoa to animals, for which reason, he is of opinion, that all infusorial plants are Fungi, and not Algæ But this may be doubted The number of Fungi which may be conceived to exist is incalculable Multitudes have been discovered by the researches of modern observers, and multitudes still remain to be detected, especially in extra-European countries In Sweden, in the small space of a square furlong, where the number of Phænogamous plants was 420, and of Lichens and Algæ 430, Fries discovered more than 2000 species of Fungi

The most celebrated writers on Fungi are Micheli, Schæffer, Bulliard, Bolton, Sowerby, and Greville, for figures, and Persoon, Link, Nees von Esenbeck, Fries, and Greville, as systematists

Link defines the essence of a Fungus to be sporules disposed in a series, in elongated tubular cells, the cells situated in some part of the external surface The part in which the reproductive organs are placed is called the *hymenium* (*a*), the hollow base from which the stem or *stipes* (*a*) arises is named the *volva* (*b*) or *wrapper*, the upper part is the cap or *pileus* (*c*), which is provided on the inferior surface with thin radiating expansions, which are termed gills or *lamellæ*, among which the sporules are situated Many Agarics have a delicate fringe connecting the margin of the pileus at a certain age with the stem, this is called the veil (*d*), and is either general (*universale*), when adnate with the surface of the pileus, but becoming obsolete with age, or it is partial when it extends only from the margin of the pileus to the stipes The *annulus* (*d*) is a kind of veil, which is sometimes fixed to the stem, at others free and capable of being moved upwards and downwards The Peridium, Perithecium, or Perisporium, are different names for the envelope immediately enwrapping the sporules

Tribe I. HYMENOMYCETES.

Hymenium naked.

Class I Hymenini v Agaricinæ.

Hymenium distinct. Receptacle long or expanded, superior

Division I. *Pileati.*

Receptacle dilated, occasionally branched, having a tendency to an orbicular form Hymenium inferior Asci fixed.

2365 *Agaricus* Hymenium in lamellæ. Lamellæ simple, parallel.

* *Stem central, with a veil. Gills unchangeable. Sporidia white*

§ 1 *Amanita* Veil double, universal separate, partial annular somewhat persistent
§ 2 *Lepiota* Veil simple, universal, concrete, annular, somewhat persistent

Observations

Tribe I *Hymenomycetes* This tribe is readily distinguished from the others by its hymenium containing sporules within the surface, and not naked, from the *Pyrenomycetes* by the want of a perithecium and a reproductive nucleus, from *Gastromycetes* by the want of a peridium inclosing the sporules, which constitute the mass of the fungus, and from the *Hyphomycetes* and *Conomycetes* by the sporidia not being exposed

Division I. *Pileati.* This constitutes the most extensive division in Fungi, and includes almost every thing which was known to the ancients Dioscorides mentions one or two species distinctly, comprehending the remainder among his eatable and unwholesome kinds Pliny talks of the very numerous kinds of fungi, but describes very few. C. Bauhin knew about sixty, which he chiefly obtained from Clusius, Tournefort had two genera and eighty-seven species; Micheli six genera and about 800 species; Linnæus three genera and fifty species, Persoon, in his Synopsis, mentions nine genera and 683 species, finally, Fries describes more than a 1000 species arranged under many genera and subgenera.

The species are widely scattered over all Europe, but the extra European fungi, with the exception of those

§ 3. *Armillaria.* Veil simple, partial, separate, annular, somewhat persistent.
§ 4. *Limacium.* Veil very fugacious, viscid Lamellæ adnate, decurrent.
§ 5. *Tricholoma.* Veil very fugacious, flocculose, marginal. Lamellæ emarginate or rounded.

** *Stem central, naked. Gills unchangeable Sporidia white.*

§ 6 *Russula* Pileus fleshy, becoming depressed. Lamellæ equal, juiceless
§ 7. *Galorhæus* Pileus fleshy, becoming depressed. Lamellæ unequal, milky
§ 8 *Clitocybe.* Pileus fleshy, when young convex. Lamellæ unequal, juiceless.
§ 9 *Collybia* Pileus fleshy-membranous, flattish *Small, dry*
§ 10 *Mycena* Pileus membranous, campanulate *Slender. Stipes hollow*
§ 11. *Omphalia.* Pileus membranous or fleshy-membranous, when young umbilicated

*** *Stem out of the centre, none Gills unchangeable. Sporidia white*

§ 12. *Pleurotus.* Pileus out of the centre or lateral.

**** *Stem always central Veil 0 Gills changing color Sporidia rose-colored*

§ 13 *Mouceron.* Pileus fleshy, becoming depressed Lamellæ long, decurrent. *Odor of new flour*
§ 14 *Clitopilus.* Pileus fleshy, convex
§ 15 *Leptonia.* Pileus fleshy, membranous, from convex becoming plane *Small.*
§ 16 *Nolanea* Pileus membranous, campanulate *Slender Stipes hollow*
§ 17 *Eccilia* Pileus umbilicate. *Lamellæ adnate*

***** *Stem always central. Veil like cobweb Gills changing color, becoming dry. Sporidia ochre-colored*

§ 18 *Telamonia* Veil annular, woven, somewhat persistent Lamellæ distant
§ 19. *Inoloma* Veil fugacious Lamellæ emarginate. Stipes bulbous *Color something of violet*
§ 20 *Dermocybe.* Veil fugacious. Lamellæ closely packed Stipes equal.

****** *Veil distinct, not like a cobweb. Gills discolored, somewhat persistent. Sporidia ferruginous*

§ 21 *Pholiota* Veil dry, annular
§ 22 *Myxacium.* Veil viscid, fugacious Lamellæ affixed
§ 23. *Hebeloma* Veil marginal, fugacious Lamellæ emarginate

******* *Veil very fugacious or spurious, not like a cobweb Gills discolored, somewhat persistent Sporidia ferruginous*

§ 24 *Flammula* Pileus fleshy, convex, smooth, somewhat viscid *Lamellæ not emarginate*
§ 25 *Inocybe* Veil formed of the longitudinal fibres of the fleshy convex pileus *Lamellæ whitish*
§ 26 *Naucoria* Pileus fleshy, membranous, flattish, squamulose *Small Lamellæ cinnamon-colored*
§ 27 *Galera* Pileus membranous, campanulate *Slender Stipes hollow.*
§ 28 *Tapinea* Pileus umbilicate, villous at edge.
§ 29. *Crepidotus* Pileus out of the centre or sessile

******** *Veil present, not unlike a cobweb Gills becoming discolored, cloudy, dissolving Sporidia brownish-purple*

§ 30 *Volvaria* Veil universal, separate *A volva.*
§ 31 *Psalliota* Veil annular
§ 32 *Hypholoma* Veil marginal, fugacious Lamellæ emarginate *Stipes bulbous*
§ 33 *Psilocybe* Veil very fugacious Pileus somewhat fleshy, and stipes equal, tenacious
§ 34 *Psatyra* Pileus somewhat membranous, and stipes brittle
§ 35 *Coprinarius* Lamellæ with a tendency to deliquesce Veil partial *Sporidia black*

2366. *Coprinus.* Hymenium in lamellæ, which finally become deliquescent Asci separate with sporidia in four rows
2367 *Gomphus* Hymenium in lamellæ, which are long branched and decurrent. Pileus turbinate, umbonate
2368 *Cantharellus* Hymenium veined Veins dichotomous, subparallel, sometimes anastomosing
2369 *Merulius* Hymenium veined Veins flexuose, or forming very irregular pores. Plants sessile, resupinate or effused
2370 *Schizophyllum* Hymenium in lamellæ Lamellæ bifid, lengthwise revolute
2371 *Dædalea* Hymenium sinuous, composed of anastomosing lamellæ or flexuose elongated pores
2372. *Polyporus* Hymenium porous, not separable from the substance of the pileus nor the pores from each other. Pores sometimes lacerating in age Pileus very rarely with a central stipes
§ 1 *Favolus* Pores ample, with four or six angles resembling an honeycomb
§ 2 *Microporus* Pores minute, roundish
§ 3 *Polystucta* Dots superficial only
2373. *Boletus.* Hymenium tubular Tubes separable from the pileus and from each other Pileus always with a central stipes
2374 *Fistulina.* Hymenium tubular Tubes loose, the young ones closed
2375 *Hydnum* Hymenium subulate Subulæ loose
2376. *Sistotrema* Pileus carnose, irregularly stipitate Hymenium composed of dentate, interrupted lamellæ.
2377 *Phlebia* Hymenium rugose, formed of long or confluent papillæ
2378 *Thelephora* Plant with very few exceptions more or less adnate, thin, coriaceous, very rarely infundibuliform. Hymenium covering the outer surface
2. *Phylacteria.* Sporidia four in a row *Resupinate and growing on the earth*
3 *Himantia.* Effuse resupinate, when young byssoid Sporidia few, innate in the hymenium, which is smooth and naked in the middle
4 *Leiostroma* Resupinate, somewhat contiguous, smooth, or with spurious papillæ. Asci none

Observations

on the coasts of Barbary, and a few from North America, are almost universally distinct from the European kinds. They are found growing on the earth, or in decayed wood, or similar substances, never upon rocks. Those which have been described as natives of vaults and places underground, are believed to be mere monstrous formations They are in greatest perfection in warm rainy weather, being chiefly the creations of summer and autumn; a few only appear in the spring, and scarcely any in the winter The duration of the pileate fungi is often only ephemeral; some last from a week to a fortnight; and a few for a longer time The Dædaleæ and Polypori are often called perennial, but it is the opinion of Fries, that their substance decays, and is only covered yearly by a fresh layer of pores The roots of many of those which grow upon trees is perennial; of others merely annual

When crude they are mostly poisonous, with a mucilaginous taste, which is often acrid, but they become less dangerous by cooking The dangerous qualities of some of the kinds is attributable to the larvæ with which they are infested

Division II. *Clavati.*

Receptacle long, simple, or branched, with a tendency to a cylindrical form, not margined Hymenium superior Asci fixed

* *Hymenium occupying the whole surface Asci distinct No distinct stem*

2379 *Clavaria* Plant carnose, cylindrical, simple or branched Hymenium smooth, occupying almost the whole surface, confluent with the stipes

2380 *Calocera.* Plant branched or simple, cylindrical, homogeneous, corneous, gelatinous, viscid. *Growing on wood*

** *Hymenium only occupying the end Asci long. Head separate from stem, simple*

2381 *Geoglossum.* Hymenium short, club-shaped, mostly compressed, stipitate. Stipes elongated, smooth or hairy Plants black or dull green

2382 *Spatularia* Hymenium club-shaped, separate, compressed, running down the stipes on each side, bearing the asci at the upper end

2383 *Mitrula* Hymenium clavate, ovate, closely surrounding at the base the stipes, which is distinct.

*** *Hymenium only occupying the end. Asci obsolete Head separate from stem.*

2384 *Typhula.* Hymenium thin, subcylindrical, persistent, terminating the capillary stipes

**** *Hymenium covering the whole surface, but bearing sporules at the end only, without asci*

2385 *Pistillaria* Simple, contiguous, linear or clavate Sporidia emerging at end.

Class II Uterini v Elvellaceæ.

Hymenium distinct, superior, marginal Receptacle urceolate or reflexed, always inferior

Division I *Mitrati*

Receptacle pileiform, bullate, never closed Hymenium neither margined nor discoid.

2386. *Morchella* Pileus lacunose, confluent with the stipes either at the margin or a little above it Hymenium occupying the whole outer surface

2387 *Helvella* Pileus submembranaceous, irregular, smooth on each surface, deflexed at the sides Hymenium occupying the whole outer surface

2388 *Verpa* Pileus conical-deflexed, equal. Hymenium smooth or rugose

2389 *Leotia* Pileus ovate-conical or orbicular, wholly occupied by the hymenium, the margin free, but closely embracing the stipes.

Division II *Cupulati*

Receptacle cupulate, equal Hymenium discoid, when young somewhat closed, surrounded by the margin of the receptacle

2390 *Peziza* Pileus mostly carnose, sessile or stipitate, more or less cup-shaped at length sometimes plane Hymenium occupying the disk

§ 1 *Aleuria* Fleshy, or fleshy-membranous, prunose or scurfy with flocculent matter, *Usually on earth.*

§ 2 *Lachnea* Waxy, hairy or villous externally *Usually on wood*

§ 3 *Phacidea* Waxy or membranous, rarely gelatinous, smooth, naked *On wood*

§ 4 *Helotium* Plano-convex *On wood*

2391 *Ascobolus* Pileus carnose, cup-shaped or hemispherical Sporuliferous cells in the disk, forming prominent points filled with a fluid intermixed with the eight sporules

Observations

Division II *Clavati* Scarcely any traces of these fungi can be discovered in the writings of the ancients Clusius described a few Fourneifort confounded them with corals and Lycoperdons. Holmskiold and Persoon are the principal modern writers upon this tribe

Almost all the species of which there is any certain knowledge are European The genuine kinds are terrestrial, those which are found upon wood, being transitious to other orders In vaults or caverns they become unusually developed, and the asci, on account of the excessive supply of moisture, expand and become flocculent Most are found in the autumn, the branched kinds are often what are termed meteoric, that is to say, spring up suddenly after heavy falls of rain They seldom last more than fourteen days

In qualities they are mild, some having a bitter taste, but the greatest number are almost entirely destitute of smell, color, or taste Many of the large kinds are used in cookery, and are eaten by various herbivorous animals

Class II *Uterini* The natural form of the receptacle is cupulate, but in the most perfect kinds, the cupula is reflexed, and is called a *mutra*, in the least perfect, which are innate in the matrix, the receptacle is almost wholly obliterated. The resupinate Pileati are distinguished from these by their immarginate form, and by their asci

Division I *Mitrati* A small division, apparently wholly unknown to the ancients The species are almost entirely European, a few are found in North America and Siberia. It is probable, however, from the evidence of Loureiro and others, that some peculiar genera and species exist within the tropics They are generally fond of a humid shady station None are found in subterraneous places If an individual is occasionally produced upon wood, it is upon such as is wholly decayed Many spring up in the autumn and spring; they are rarely meteoric, but some appear in greater abundance in one kind of season than in another. Most of them last for a fortnight, and retain their form when dry

Their qualities are generally mild, nutritive, and juiceless, one is said to be bitter They are little infested by larvæ Several are used as food

Division II *Cupulati* These are included in the Fungoides of the old botanists The species which are separate from their thallus and much developed, are little changed by the places in which they grow, and are therefore the same in the most remote countries, but the eruptive or innate species, which are more affected by the nature of the substance by which they are fed, are liable to greater changes when their matrix is altered For it is a general rule, that the more a fungus is innate in the substance which produces it, the more it is not only imperfect, but affected by its situation, and *vice-versâ* Hence Caoma, which is of a very low order, consists of as many species as the plants upon which it grows, just as a vowel forms as many distinct words as it is combined with distinct consonants

The Clavati and Pileati, which chiefly depend upon the access of light, are in perfection from spring to autumn, the Elvellaceæ from autumn to spring The Cupulati also depend much upon the operation of light, for in caverns or cellars they remain closed and sphæria-like Such is the case with Peziza cerina, which in dark places, undergoes many metamorphoses, and Cenangium under similar circumstances, when some obstacle is offered to the developement of its hymenium, becomes deliquescent. Generally the terrestrial sorts agree in habitude with the preceding divisions, but those which are eruptive are often in perfection for half a year together

Class III. *Tycmellini.* These are nearly akin to the Pileati and Clavati, especially to Thelephora and Calocera; and also to Elvellaceæ, more particularly to Hygromitra, Peziza, Mollisia, Bulgaria, and Ditiola, but they are distinguished without difficulty by the characters assigned to them.

Formerly all the genera were confounded under one, along with various species of Lichens and Algæ. These

2392. *Bulgaria.* Cupula closed at first Asci immersed, with paraphyses, becoming separate and bursting out *Gelatinous*
2393 *Dctola.* Hymenium becoming plaited and deliquescent Cupula open Veil universal *Corky*
2394 *Cenangium.* Hymenium smooth, persistent, rarely deliquescent. Cupula closed, but opening finally *Somewhat coriaceous*
2395 *Stictis.* Hymenium smooth, immersed. Cupula obliterated *Hymenium persistent*
2396. *Cryptomyces* Spreading, quite adnate, emerging, nearly plane, carnose. Hymenium covering the whole surface. Theca erect. Sporidia large, oval

Class III. TREMELLINI

Hymenium confounded with a gelatinous receptacle Sporidia separate Asci none

2397 *Tremella.* Receptacle gelatinous homogeneous, fructifying in all directions, without papillæ. Sporidia nearly emerging
§ 1 *Coryne* Fleshy gelatinous, somewhat clavate
§ 2 *Phyllopta.* Somewhat cartilaginous, expanded, leafy
2398 *Exidia.* Receptacle gelatinous, homogeneous, covered on the upper surface only by a papillose hymenium. Sporidia emitted with elasticity
2399 *Dacrymyces.* Receptacle gelatinous, homogeneous, filled with assurgent flocci, and sporidia placed in layers inside *When young compact, but finally deliquescent*
2400 *Agyrium* Receptacle spherical, smooth, compact, waxy, when humid gelatinous, finally crumbling away in sporidia
2401 *Hymenella* Receptacle flattened, adnate, smooth, like soft leather, very thin, persistent
2402 *Namatelia.* Receptacle gelatinous, surrounding a compact heterogeneous nucleus. Sporidia emerging

Class IV SCLEROTIACEÆ

Hymenium confounded both with the fleshy receptacle and the sporidia Asci none

2403. *Acrospermum.* Elongated, somewhat clavate, with a coat of a similar substance, distinctly fructifying at the end
2404 *Sclerotium* Subglobose, or without regular form within, homogeneous, vesiculose, carnose, or corneous Sporules unknown
2405 *Rhizoctonia.* Deformed, united with a similar persistent coat by means of root-like fibres proceeding from all points of its surface
2406 *Persoia.* Rootless, fleshy, covered entirely by a villous persistent coat
2407 *Acinula* Rootless, smooth, with a distinct farinaceous granular coat
2408 *Erysiphe* Sporangium epiphyllous, very minute, globose, furnished with white radiating subjacent filaments, and containing sporuliferous bodies

TRIBE II GASTEROMYCETES,

Fungus entirely closed, and bearing sporidia in the centre, and so forming an uterus

Class I ANGIOGASTRES.

Uterus finally bursting forth, separate from the receptacle Sporidia lodged in the receptacle

Division I *Phallodea*

Receptacle separate, open on account of the bursting of the uterus Sporidia placed in a mucous layer.

2409 *Phallus.* Stipes issuing from a volva Pileus furnished with large cells filled with a sporuliferous slimy substance

Observations

are by modern writers now referred to their proper stations The genus *Mycoderma* of Persoon, to which are referred those tough skin-like coatings which are found upon vegetable extracts enclosed in bottles, and which is generally placed among Tremellini, is thought by Fries to be not of a vegetable nature

The species at present known are found in Europe, Asia, and North America, but no material difference seems to be caused in them by their native country All the species, with one exception, are epiphytes, the most perfect bursting forth from the bark of trees, the least perfect occurring on decorticated wood, the stems of herbs, &c &c The more the wood is dried, the nearer the species approach to Lichens, the more it is humid to Algæ They are in perfection in the latter part of autumn, winter, and early spring, but scarcely any are found in the summer Some live for a month or more, others appear to be perennial When dry they are not to be recognized, they may nevertheless be preserved, and if moistened, they recover their original appearance It must be observed, that they are in all cases to be examined in a wet and tumid state

Their qualities are refrigerant, and but little known They are destitute of smell and taste, for which reason, and on account of their mucilaginous texture, scarcely any species is eatable Many of the large kinds were formerly used in medicine in cases of ophthalmia, under the name of the "Jew's ear" Vinegar in which they had been steeped was also used as a gargle in tumors of the throat, according to Clusius Tremella fimbriata is said to furnish a dye, and the sporidia of T. mesenterica to dye yellow. Dacrymyces destroys timber

Class IV. *Sclerotiaceæ* The affinity of this class is complex, for the lower we descend, the less differences are to be found between natural bodies Thus Sclerotiaceæ are not only closely connected with the preceding divisions, but have a more or less obvious relation to all the *hymenine* and epiphytous classes of other tribes

Before the time of Tode, a most sagacious observer, who was the first to distinguish the Sclerotia from other fungi, a very few species only were known, which were confounded with Lycoperdon, Sphæria, Tuber, and other genera. He was followed by various other mycologists, and especially by Decandolle, who described thirty-nine species Tode, Persoon, and Link, have been unable to detect any fructification, Decandolle, Ehrenberg, and Fries, declare that the sporidia are scattered through the whole mass of the fungus, and emerge from it like hoar-frost

Most of the known species are epiphytes, either upon living or recently dead plants When growing in cellars and subterraneous places they undergo no alteration, but they do not fructify They flourish most in the winter, late in the autumn, and early in the spring, and are exceedingly common just at the retreat of winter A very few Spermodia only are found in the summer Their odor and smell are either inconspicuous or nauseous. None of the species at least are eatable Those which grow on rotten seeds are exceedingly poisonous Some feed on the roots of living plants, which they destroy, others infest sickly herbs, whence they are a pest to the farmers

Tribe II. *Gasteromycetes* These fungi consist of concrete cells, they have a determinate figure and a tendency to a spherical form, at first they are closed, but finally are furnished with an orifice, or burst in an irregular manner, and emit an internal mass of reproductive matter, which either crumbles to pieces or deliquesces The integument is of various natures, either a volva, a peridium, or perithecium, of a somewhat bladdery texture, and is simple or double, but rarely multiple. They almost all, when young, are fluxile or soft, or have some part or another of a fluid nature, afterwards they become indurated and rigid, and assume their true forms.

Class I *Angiogastres* These are fungi of remarkable forms, and most unusual mode of fructifying, they were well known to Clusius, not to mention the celebrated Truffle of which Theophrastus had knowledge They are found in different climates, but the most perfect only in temperate regions. The latter are also

2410. *Batarrea.* Head hemispherical, crumbling to pieces under the vertex into a little tuft of hairs bearing sporules Stipes smooth. Involucrum triple, flowing with mucilage

Division II. *Tuberaceæ.*

Sporangia membranous, scattered in an hymenium which is often grated with veins, and inclosed in the uterus. Sporidia pulpy at first.

2411. *Tuber* Uterus closed, marbled with veins inside. Sporangia stalked, scattered among the veins. *Subterraneous*

2412. *Rhizopogon* Uterus sessile, bursting with irregularity, with anastomozing veins inside Sporangia sessile *Above ground*

Division III. *Nidulariaceæ.*

Uterus filled with separate sporangia.

2413 *Nidularia.* Common peridium simple. Sporangia lenticular, fleshy, with sporidia in heaps in the middle.

2414 *Myriococcum* Peridium simple, flocculent-furfuraceous, disappearing. Sporangia globose, with sporidia in round heaps

2415 *Polyangium* Peridium simple, membranous Sporangia oblong, filled with a grumous mass.

Division IV. *Carpoboli.*

Uterus protruding a solitary separate sporangium.

2416. *Atractobolus* Peridium cupuliæform, with a lid Sporangium fusiform, with mucous sporidia.

2417 *Thelebolus* Peridium sessile, urceolate-ventricose with an entire orifice. Sporangium papilliæform, with mucous sporidia

2418 *Pilobolus.* Stipes or receptacle pellucid, watery Peridium a roundish vesicle, bursting elastically, placed on the apex of the receptacle

2419 *Sphærobolus* Peridium double, both stellate, the inner membranous by inversion throwing out with elasticity a globose sporangium, bearing in the middle heaped sporidia.

Class II Pyrenomycetes.

Uterus genuine, forming the receptacle Sporidia disposed in asci in regular rows

Division I. *Sphæriacei*

Perithecium closed, perforated by an orifice, filled by an ascigerous somewhat deliquescent nucleus.

2420 *Xylaria* Receptacles stipitate, carnose or suberose Spherules immersed in the receptacle, and containing a gelatinous sporuliferous mass.

2421. *Stromatosphæria* Receptacle sessile, free, or bursting from beneath the bark of dead wood. Spherules immersed.

2422. *Cucurbitaria* Spherules tufted, free, fixed on a receptacle, rarely at first included Receptacle bursting through the bark.

2423. *Cryptosphæria* Receptacle O Spherules scattered or aggregate, lying beneath the epidermis or bark, orifice various more or less exserted

2424 *Heterosphæria* (See Notes)

2425. *Sphærsa* Receptacle O. Spherules sessile on the surface or slightly immersed

2426. *Lophium* Perithecium vertical, compressed, dehiscing by a longitudinal somewhat closed cleft Asci crumbling away

Division II *Cytisporei.*

Closed, perforated by an orifice. Asci none, sporidia surrounded by a little bag or thin cellule, deliquescent

2427 *Sphæronema* Perithecium opening by a pore, enclosing in a very thin bag some mucous sporidia, which burst forth and become indurated in a globose form. *Naked*

2428 *Septaria.* (See Notes)

2429. *Cytispora* Cellular-many-celled, cells deformed, membranous, united at ends. Nucleus gelatinous, filled with sporules, propelled through the common elongated orifice

2430 *Phoma.* Nucleus grumous, enclosed in a tubercle Sporidia emitted by a simple orifice without regularity.

Division III *Phacidiacei*

Perithecium finally bursting, with an open disk Asci erect, fixed

2431 *Dothidea.* Nucleus inclosing immersed cellules. True perithecium obliterated. Asci erect, remaining for a long time.

2432 *Rhytisma* Perithecium deformed, bursting into transverse fragments by means of a flexuose crack

2433. *Phacidium.* Receptacle O Perithecia sessile, depressed, bursting from the centre towards the circumference in several acute segments Sporuliferous cells elongated, fixed.

2434 *Hysterium* Perithecia mostly oblong, black, corneous, bursting by a longitudinal slit Sporuliferous tubes erect. (Crust none)

Division IV. *Xylomacei*

Asci obsolete Sporidia innate.

2435 *Actinothyrium* Perithecium buckler-like, with radiating fibres covering the fusiform sporidia

2436 *Leptostroma.* Perithecium uniform, without an orifice, but entirely separating and exposing a very thin disk

2437 *Xyloma* Black, corneous. Perithecia single, solitary and minute, or united and confluent, irregularly dehiscent.

Observations

terrestrial; the imperfect kinds being inhabitants either of plants or of the dung of animals. Many are meteoric, flourishing most in "Jove tonante, densisque cadentibus imbris," others are ephemeral, some exist for a month and more

The Phalloideæ are generally very fætid, cold, and venomous; one species is accounted in China a vulnerary, and also a food, but of doubtful quality The old physicians had some peculiar notions about their use in arthritis, &c but they are not worth repeating The Tuberaceæ have a peculiar smell, which is often grateful, their taste is irritating, their qualities esculent, nutritive, and aphrodisiacal.

Class II *Pyrenomycetes* The affinity of this class is very complex, for which reason there is much difference of opinion among authors as to its limits In fructification it approaches fungi of a higher degree of developement; on one hand resembling the Angiogastres, from which it is readily distinguished by its separate receptacle, on the other hand, the Cupulati, whose differences depend upon the definition of their perithecium. In point of vegetation it descends, first, to Sclerotiaceæ, which are entirely different, in the absence of an uterus and nucleus, secondly, to Perisporia, which have no distinct perithecium, and no asci; and thirdly, to several genera of Coniomycetes.

2438 *Lasiobotrys* (See Notes)
2439 *Asterina* Black, minute, epiphyllous. Receptacle radiate, filamentous, very adnate, at length tubercled here and there.

Class III TRICHOSPERMI.

Uterus genuine, forming a receptacle. Sporidia intermixed with flocci.

Division I. *Lycoperdinei.*

Uterus of a determinate figure, fleshy when young Flocci copious

2440 *Onygena.* Subglobose with a fibrous stipes Peridium crustaceous, fragile, with interwoven fibres Sporules naked, compactly clustered
2441 *Tulostoma* Globose stipitate Involucrum none. Peridium opening by a bordered pore in the summit. Sporules scattered in it.
2442 *Scleroderma.* Sporangium globose or prolonged into a stipes. Peridium single, coriaceous, mostly warty, bursting at the apex or subdehiscent Sporules collected into little contiguous distinct globules mixed with filaments.
2443 *Lycoperdon* Sporangium globose Peridium single, membranaceous, scaly, with warts or soft spines bursting irregularly at the apex, and containing a mass of sporules and filaments.
2444 *Bovista* Sporangium globose Peridium double, the outer one adnate, cracking, somewhat fugacious, inner one bursting at the apex, and containing a mass of filaments and pedicellated sporules
2445 *Geastrum* Globose sessile. Involucrum coriaceous, stellate Peridium membranous. Sporules on stalks from the first.

Division II. *Trichocisti.*

Uterus regular, when young pulpy Sporidia having numerous flocci scattered among them

2446. *Craterium.* Peridium oblong, stipitate, operculate, containing a cellulose, filamentous, sporuliferous mass
2447 *Stemonitis* Cylindrical or subglobose. Peridium fugacious Filaments forming a reticulated mass, perforated by the stipes to which they are attached Sporules intermixed
2448 *Cribraria* Globose stipitate Peridium crumbling to pieces at the summit in cracks.
2449. *Dictydium* Globose stipitate Peridium crumbling to pieces entirely or for the most part.
2450 *Arcyria* Mostly cylindrical Peridium fugacious, except a small portion at the base Filaments abundant, reticulated, fixed at the base Sporules intermixed
2451 *Leangium* Minute subglobose Peridium single, membranaceous, bursting into subregular, persistent, expanding segments Filaments attached at the base and surrounding a columella
2452, *Trichia* Minute subglobose or irregular Peridium single, membranaceous, bursting Filaments involute attached at the base, and expanding elastically
2453. *Diderma* Minute subglobose Peridium double, the outer one fragile and fugitive Sporules mixed with a few filaments and surrounding a roundish columella
2454 *Physarum* Sporangium minute, mostly stipitate, subglobose Peridium single, membranaceous, bursting and deciduous in distinct portions Sporules mixed with a mass of filaments
2455 *Leucarpus* Minute Peridium single, fragile, bursting, sessile or substipitate, containing a black mass of sporules mixed with a few filaments Columella O

Division III *Fuligmoides*

Uterus somewhat deformed, sessile, when young pulpy Sporidia separated by flocci.

2456 *Lycogala* Sessile globose or subirregular, pulpy when young Peridium single, fragile, variously dehiscent Sporules mixed with a few filaments
2457 *Spumaria* Form irregular, roundish, effused Peridium soft, at length membranaceous, fragile. Sporules contained in the folds of branched, elongated, membranaceous, persistent processes.

Division IV *Luceoides*

Flocci obsolete

2458 *Dichospormum* Flattened hemispherical Peridium membranous, coated with a layer of granules Sporules in globose masses
2459 *Licea* Peridium membranaceous, sessile, fragile, inclosing a pulverulent mass of sporules unmixed with filaments (No subjacent membrane)

Class IV MUCOROIDEI

Peridium formed of flocci loosely woven together, vanishing in the middle Sporidia in heaps

2460 *Mucor.* Peridium membranaceous, globose, stipitate, pellucid, at length opake Pedicel simple or branched, tubular, articulated
2461 *Thamnidium* Stipes branched at base, branches bearing solitary globules at their end Peridium globose
2462 *Ascophora* Peridium membranaceous, stipitate, bursting at length, turned inside out, convex and subpersistent. Pedicel simple or branched, tubular, pellucid, articulated

Class V PERISPORIA

Perisporium thin, somewhat membranous, bursting Sporidia immersed, scarcely distinct.

2463 *Eurotium.* Peridia membranous, subglobose, with an articulated floccose innate receptacle. Sporules naked in masses
2464 *Amphisporium* Subglobose Peridium membranous, thin Sporules naked of two forms.

Observations.

Its extent is very great, ascending from the most simple forms to those which are very compound, but at the same time connected with the former by the most strict natural ties The true place of the genera in the system has been a subject of doubt Many authors have taken them for fungi in the most perfect state Decandolle excludes them from fungi, and, with some analogous Lichens, refers them to a peculiar intermediate family

They are found in every part of the world in which vegetation exists; for every perfect plant and all its decaying parts nourish Pyrenomycetes The chief families of trees in the European Flora upon which they flourish are Coniferæ, Amentaceæ, Rosaceæ, Ericeæ, Rhamnoideæ, Aceriniæ, and Tiliaceæ, and of herbs, Gramineæ, Umbelliferæ, and Liliaceæ Many are peculiar to certain species of trees, and others are common to many species. For example, on the Betula alba may be found about ten peculiar species, and from forty to fifty which are common to it and other trees Their qualities are unknown Many species which are included by Fries under the name of Ectostroma, are probably not vegetables, and are here omitted.

Tribe III HYPHOMYCETES.

Thallus flocculent.

Class I. Cephalotrichi.

Receptacle distinct, covered over with flocci, with sporidia scattered among them.

2465 *Ceratium.* Filaments very short, pellucid, simple, minute, attached to a membranaceous, plicate simple or branched, filiform receptacle.

2466 *Isaria.* Filaments minute and pellucid, attached to an elongated, simple or branched, clavate, carnose receptacle.

Class II. Stilboidei.

Fibres grown together upon the receptacle. Sporidia inclosed in a separate naked head.

2467 *Stilbum* Minute Stipes slender, bearing a little round solid head, which is pellucid and semifluid at first, at length more dense and opake

Class III. Inomycetes.

Fibres genuine, somewhat separated by divisions. Receptacle none. Upon putrescent organic matter.

Division I. *Byssacei.*

Opake fibres, bearing sporæ inside, when fertile jointed, when sterile contiguous. Repel moisture.

2468 *Torula* Thallus composed of branched, rigid, fragile, moniliform, subopake filaments, the articulations minute, globose

2469 *Monilia* Fibres numerous, erect, opaque, distinctly articulated, permanent Articulations ovate.

2470 *Racodium* Thallus composed of branched, decumbent, interwoven, jointless, persistent, subopake filaments, among which are sometimes granules of moniliform filaments

2471 *Dematium.* Fibres decumbent or ascending, rigid, opake, branched, continuous in all directions, permanent.

2472 *Cladosporium* Thallus composed of erect, rigid, subopake, jointed, simple or branched, aggregate filaments Sporules ovate, attached in a series to the filaments, deciduous

2473 *Helicosporium* Fibres erect, rigid, nearly simple, opake Sporules spiral, remotely jointed, some that are fugacious scattered among them.

2474 *Ozonium* Thallus composed of decumbent, branched, entangled filaments: primary ones thick, irregular, ultimate ones fine-jointed

2475 *Rhizomorpha.* Receptacle much branched, elongated, coriaceous or ligneous. Perithecia arising from the branches, mostly clavate, dehiscent at the apex.

Division II *Mucedines*

Flocci pellucid, with dissepiments, bearing sporæ on the outside

2476 *Sepedonium* Thallus formed of entangled filaments, spreading within putrefying fungi Sporidia scattered, globose. (Bright yellow)

2477 *Acremonium* Thallus composed of decumbent, entangled, branched, pellucid filaments. Sporidia globose, solitary, pedicellate

2478 *Sporotrichum* Thallus minute, tufted or expanded Sporidia scattered among the branched, tubular jointed filaments

2479 *Trichothecium* Filaments minute, branched, forming a tufted thallus Sporidia scattered, subglobose, didymous

2480 *Acrosporium* Thallus composed of minute, tufted, pellucid, moniliform, simple filaments, the uppermost joints (sporidia) separating spontaneously

2481 *Botrylis* Thallus composed of decumbent, entangled, branched, pellucid filaments. Sporidia globose, solitary, pedicellate

2482 *Aspergillus* Thallus composed of minute, pellucid, scattered or tufted filaments, apex of the main filament mostly clavate, on which is a head of (often beaded) sporidia

2483 *Stachylidium* Thallus composed of tufted, pellucid filaments sterile ones procumbent, fertile ones erect, whorled, with ramuli near the top, among which the sporidia are collected.

2484 *Penicillium* Thallus composed of tufted, pellucid filaments sterile ones procumbent, fertile ones erect, bearing a terminal pencil-like tuft of erect ramuli, to which the sporidia are attached.

2485 *Trichoderma* Sporidia collected in the centre, free, the filaments woven into a web-like covering, at length opening at the apex and discharging the globose sporidia.

Class IV. Phylleriaceæ

Fibres spurious, contiguous, bearing sporæ inside Receptacle none On living leaves

2486 *Rubigo* Fibres infundibuliform or clavate, twisted, situated in patches upon sickly leaves

2487 *Erineum* Peridia flocciform, subdiaphanous, various, subsimple, aggregato-cæspitose, parasitic on living leaves Sporules sometimes, but rarely evident.

Tribe IV CONIOMYCETES

Sporidia naked, without any heterogeneous receptacle.

Class I. Tuberculariæ.

Sporidia naked, simple, scattered over the receptacle.

2488 *Tubercularia* Sporangium subglobose, sessile, or somewhat stipitate, carnoso-vesiculose (not gelatinous) Sporidia towards the circumference (color mostly red).

2489 *Fusarium.* Minute, subglobose, naked, almost wholly formed of fusiform, free, jointless sporidia.

2490 *Exosporium.* (See Notes.)

Observations.

Tribe III. *Hyphomycetes* Distinguished from other tribes by their flocculent thallus. In no other tribe do flocci occur in so perfect a state of developement, although they undoubtedly exist as subordinate organs in the Uterini and Hymenomycetes.

Class IV. *Phylleriaceæ.* These are perhaps morbid states of the outer integuments of plants. This at least seems obvious in Phyllerium Rubi, Gei, &c. which are nothing but the hairs of the leaves in a clustered and somewhat altered form. This also may be the reason why there are no sporidia

Tribe IV *Coniomycetes.* To this are referred those fungi in which the sporidia are of a more obvious nature than the other parts of the plant, and so constitute the essence of the fungus Hence they are more evolved than in any other class. The receptacle, if present, arises either out of united pedicels, or of united sporidia,

Class II. ENTOPHYTÆ.

Sporidia naked, separate, without a receptacle.

Division I. *Stilbosporei.*

Entophytes growing upon dead plants.

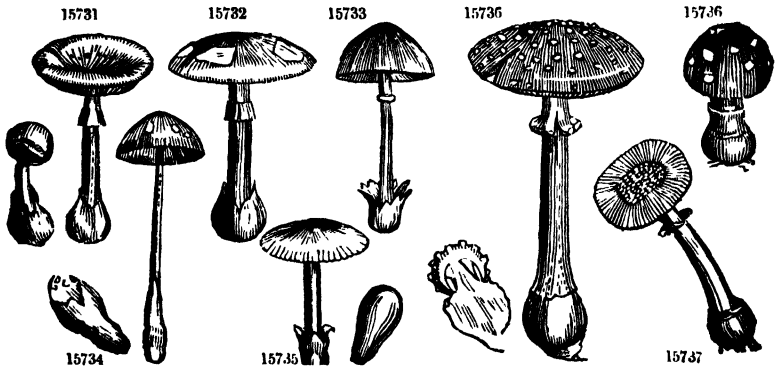
2491 *Fusidium.* Thallus plane, effused. Filaments short, branched. Sporidia fusiform, scattered.
2492. *Polythrincium.* (See Notes.)
2493 *Stilbospora.* Black. Receptacle O? or a pulverulent mass intermixed with naked sporidia, the whole bursting through the bark in the manner of a Stromatosphæria.
2494 *Sporidermium.* (See Notes.)
2495 *Næmospora* Receptacle O Spherules obvious, or somewhat obsolete, discharging sporuliferous pulp through the bark in the form of tendrils.

Division II. *Hypodermia.*

Parasites upon living plants.

2496. *Cylindrosporium* Very minute, parasitic on the surface of living leaves. Sporidia pellucid, cylindrical, truncate, free, not divided.
2497 *Uredo* Epidermis of the leaf forming a pseudo-peridium. Sporidia 1-celled, free, mostly globose.
2498 *Æcidium* Peridium membranaceous, bursting through the epidermis, and dehiscent at the apex, with a dentate or lacerate orifice
2599 *Puccinia.* Epidermis of the leaf forming a pseudo-peridium. Sporidia fixed by a pedicel, one or many-celled.

Observations



and is homogeneous with the immature sporidia The thallus is never flocculent. The organs of nutrition and reproduction are the same.

Division II. *Hypodermia* The genera of this division are furnished with a calículus, which must not be confounded with the receptacle or thallus, &c of other tribes, because it does not constitute part of the fungus, but is formed out of the epidermis of the plant on which the fungus grows.

HYMENOMYCETES.

Class I Hymenini — Div I. *Pileats.*

History, Use, Propagation, Culture,

2365 *Agaricus* This, the most extensive genus in the vegetable kingdom, derives its name from *Agaria*, a kingdom of Sarmatia. The species are determined upon various principles Some writers have mixed together species of the most different kinds, as Gleditsch, and a few writers only have really taken pains to ascertain the species If it is divided into many genera it would be necessary to break up Boletus also, which would scarcely be judicious An accurate and simple mode of division is, however, of the utmost moment, and several methods have been proposed, the greater part of which are artificial, and therefore objectionable, such, for example, as that of Villars, from the magnitude of the species, of Linnæus, from the color of the pileus, of Haller, from the color of the lamellæ or gills, of Withering, from the nature of the stipes and the color of the lamellæ taken together, or of Otto, from the position of the lamellæ The divisions of Fries, which are all named as subgenera, depend upon the characters of the veil, the lamellæ, the sporidia, and the pileus. Our notes will follow these in their order of succession

§ 1 *Amanita* This name was applied by Galen to some eatable fungus, and has been restored in modern days by Persoon Most of the species are poisonous They do not perish quickly, and are found for the most part on damp earth in shady woods, never upon wood or the dung of animals They are in perfection about the end of summer

A vaginatus is eaten by the Muscovites, but in the Jena Literary Gazette of 1819, it is declared to be poisonous A. ovoideus is said to be delicious

A muscarius, or reddish mushroon, has a large pileus, varying much in color, white, red, or crimson, convex, sprinkled with downy warts, which are raised, compact, and angular, or thin, flat, and ragged, turning up with age, from two to seven inches over, flesh white, reddish in decay · gills fixed, white, yellowish with age, mostly uniform, but a shorter one sometimes intervening, the shorter gills varying much in length, but rarely less than one-third the length of the long ones the stem solid and cylindrical, but the internal substance shrivelling with age leaves irregular hollows, scaly, bulbous at the base, from three to five inches high, and from three quarters to one and a half inch in diameter, ring broad, permanent, and turned down upon the stem. This plant rises out of the ground inclosed within its brown studded wrapper It is found in pastures. The juice rubbed on the walls and bed-posts destroys bugs, and in the North of Europe, the inhabitants infuse it in

HYMENOMYCETES.

Class I. HYMENINI.—Div. I. *Pileati.*

* *Volva loose: edge of the cap smooth.* UNWHOLESOME.

15731 Cap somewhat scaly: edge smooth, Stipes solid nearly equal, Volva loosely sheathed
15732 Cap somewhat scaly · edge smooth, Stipes hollow at top, Volva connate bulbous

15733 Cap naked: edge smooth, Stipes somewhat fistular equal, Volva booted

** *Volva loose edge of the cap striated* EATABLE.

15734 Cap furrowed at edge, Gills white, Stipes fistular tapering nearly naked, Volva sheathing

15735 Whole plant white, Cap plane or slightly umbonate · the centre often pale ochraceous; margin striato-pectinate, Lamella somewhat distant, Stipes solid naked bulbous

*** *Volva obliterated edge of the cap striated* POISONOUS.

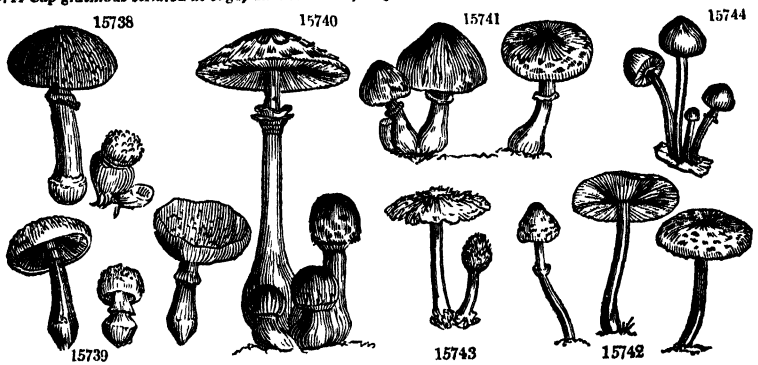
15736 Margin of the cap striated orange-red shining warty rarely naked, Volva vanishing scaly, Stipes bulbous
15737 Cap equally warted edge striated, Stipes nearly solid equal, Volva booted adnate

**** *Volva obliterated edge of the cap smooth* UNWHOLESOME.

15738 Warts of cap mealy unequal · edge smooth, Flesh pink, Stipes solid somewhat scaly and bulbous
15739 Cap somewhat umbonate rough with acute warts edge smooth, Stipes solid somew. taper. squarrulose

* *Veil finally separate, Gills distant* EATABLE

15740 Large, Cap scaly, Lamella distant white, Stipes very long bulbous, Collar free
15741 Skin of cap contiguous, Lamella remote, Stipes equal, Collar free



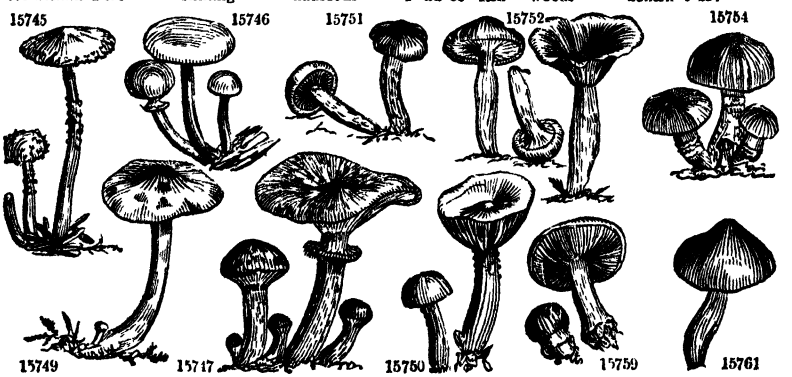
** *Veil fixed, Skin of the cap peeling off, Gills separate.*

15742 Inodorous, Cap with the epidermis broken into ferruginous scales, Lamella white numerous, Stipes subsquamose, Collar mostly fugacious

15743 Highly odor. Surface of cap white with reddish scales, Lamella distinct, Stipes smooth, Collar fugacious

*** *Veil fixed, Gills separate, Skin of the cap adhering*

15744 Cap glutinous striated at edge, Lamella loose, Stipes viscid on account of the veil



and Miscellaneous Particulars.

milk, and set it in their windows in order to poison the flies who taste it This is *moucho-more* of the Russians, Kamtchadales, and Koriars, who use it for intoxication They sometimes eat it dry, and sometimes immerse it in a liquor made with the epilobium, and when they drink this liquor, they are seized with convulsions in all their limbs, followed with that kind of raving which attends a burning fever They personify this mush-room; and if they are urged by its effects to suicide, or any dreadful crime, they pretend to obey its commands. To fit themselves for premeditated assassination, they retire to the use of the moucho-more A powder of the root, or of that part of the stem which is covered by the earth, is recommended in epileptic cases, and exter-nally applied for dissipating hard globular swellings, and for healing ulcers. The dose is from half a scruple to one, taken thrice a day in water, but a dram administered once a day in vinegar has been thought more efficacious *Murray, App. Med.* vol v. p 560 Dr Withering enumerates ten varieties of this species.

§ 2 *Lepiota* Terrestrial, solitary, persistent, autumnal fungi, none of which are noxious. Named from λεπις, a thin membranous layer or cuticle The A procerus, or tall mushroom, is not uncommon on hedge banks and dry pastures, and is sometimes exposed to sale in Covent Garden market. It may be distinguished from the genuine sort by the sponginess of its flesh, and from others by its fine and large horizontal ring The gills are white, uniform, and fixed to a collar, the pileus is a broad cone, bossed white-brown, and scaly; the stem is scaly, and the ring loose This plant, when preserved in pickle, is very apt to run into the vinous fer-mentation

A xerampelinus is the most splendid of all the agarics. Its gills are fixed, bright golden-yellow, and nearly orange under the edge of the pileus, regularly disposed four in a set, fleshy, brittle, and serrated at the edge with a paler cottony matter. the pileus is a fine lake-red, changing with age to a rich orange and buff, and every intermediate shade of these colors, which render it very beautiful; convex, center bossed, edge turned down, three to four inches in diameter, clothy to the touch; flesh pale-buff. stem solid, nearly cylindrical, but gradually tapering upwards, rich buff, shaded with fine rose-red, three to five inches high, half inch in diameter; flesh pale, buffy, spongy, and elastic. This is common in Italy, and brought to the markets for sale The ancient Romans esteemed it one of the greatest luxuries for the table. It was made the vehicle for poison to Claudius Cæsar by his wife Agrippina, and has therefore been celebrated by Juvenal and Martial.

History, Use, Propagation, Culture,

Schæffer and Clusius have recited several curious circumstances respecting it Dr Withering apprehends that these authors have mistaken the species, and that their account should be transferred to the A. deliciosus. The A. xerampelinus is eatable, but its taste is not at all agreeable. It is the A. cæsareus of Schæffer, and first found by Dr Withering's daughter on the red rock plantations at Edgbaston, July 6th, 1791, and afterwards in September 1793, and in July 1792, among moss in the fir plantations at Tettenhall, Staffordshire. Dr. W. enumerates five varieties.

§ 3. *Armillaria.* From *armilla*, a necklace Autumnal species, of permanent duration, firm, and esculent.

***** Veil fixed, Cap covered, Gills somewhat united*

15745 Cap with furfuraceous scales reddish-yellow, Lamella fixed white, Stipes subsolid covered below the veil with squarrose scales

** Cæspitose, Cap smooth.*

15746 Somew cæspit. Cap thin glutin Lamellæ annex dist. Stipes bulb. Collar reflex and then erect furrowed

*** Cæspitose, Cap not smooth*

15747 Cap dull-yell. rough with black. hairy scales, Lamellæ adnate-decurr dist. Stipes fibrous, Coll. tum. spread.

** Cap smooth, floccose at edge.* UNWHOLESOME.

15748 Cap smooth whitish, Margin and top of stipes yellow-flocculent with crisp lamellæ
15749 Cap smooth whitish-pink edge involute downy, Lamellæ straight, Stipes thickened upwards scaly

*** Cap smooth, Stalk scaly* EATABLE

15750 White, Cap smooth umbon. Lamellæ broad dist. very decur Stipes white scurfy solid becom holl in age

**** Cap finally depressed, Stalk spotted*

15751 Cap umbonate smooth olive-brown, Lamellæ connected white, Stipes solid mottled with brown [yellow
15752 Cap obt smooth yellow covered by an olive-colored gluten, Lamellæ distinct and stipes (which is spotted)
15753 Cap smooth cinnamon-col. Lamellæ somewhat decurrent and hollow, Stipes spotted rufous

** Cap truly fleshy, somewhat blunt, humid, viscid, with an involute downy edge, Gills white or yellow, emarginate, Stalk clothed, separate from the cap*

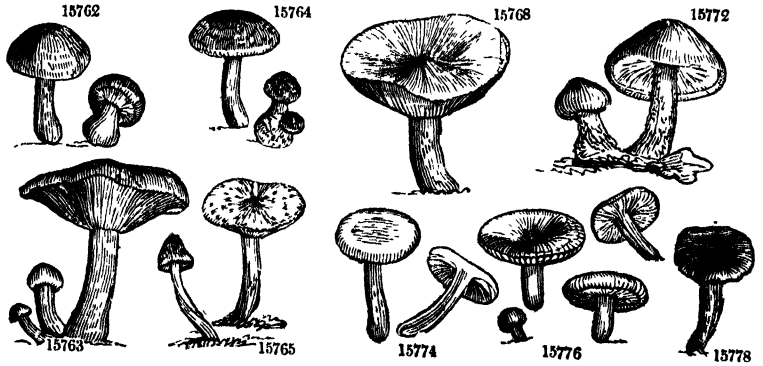
15754 Cap smooth viscid umber-col Lamellæ annexed white, Stipes solid smooth scaly at end
15755 Cap viscid virgate rufous brown discoidal, Lamellæ annexed yellow, Stipes hollow equal fibrous
15756 Cap smooth viscid red-brown, Lamellæ emarginate white, Stipes equal solid fibrous
15757 Cap somew. depress visc granul. and solid stipes eq scaly at end rose-color Lam somew separate white
15758 Cap somewhat scaly viscid yellow-orange, Lamellæ adnate white, Stipes solid covered with orange scales
15759 Cap scaly viscid yellow-green, Lamellæ separate yellow, Stipes solid thick tuberous
15760 Cap flexuose virgate viscid lurid, Lamellæ emargin broad and solid, Stipes somew scaly yellowish-white
15761 Cap flexuose smooth greenish ash-colored, Lamellæ emarginate narrow yellowish, Stipes solid scaly pallid

*** Cap always dry, scaly, with the young edge involute, downy, or villous, Gills separate or emarginate, Stalk scaly, separate from cap*

15762 Cap comp flexuose somew scaly yellow-brown, Lamellæ emarg comp and solid, Stipes scaly sulphure
15763 Cap obt convex deep-yellow more or less covered with crimson red squamulose fibres, Lamellæ rounded numerous yellow, Stipes solid or partly hollow streaked with red
15764 Cap umbon rufous, Skin torn with hairy scales downy at edge, Lamellæ affixed whit. Stipes holl fibrous
15765 Firm, Cap dry smooth a little scaly brownish-livid, Lamellæ emarg somew, dist whit Stipes solid uneq.
15766 White, Cap irregular becoming scaly and cracked, Lamellæ emargin compact, Stipes solid short smooth

**** Cap always dry, smooth, but often fibrillose, with a naked edge, Gills separate or emarginate, Stalk solid, smooth, striated, separate from the cap*

15767 Cap umbonate dry yellow-brown fibrous towards edge, Lamellæ emarg broad and solid striat Stipes yell
15768 Cap somew umbon dry yellow streaked with black hairs, Lamellæ emargin broad and solid, Stipes white
15769 Cap umbonate dry grey streaked with black, Lamellæ emargin broad hoary, Stipes solid striated whitish



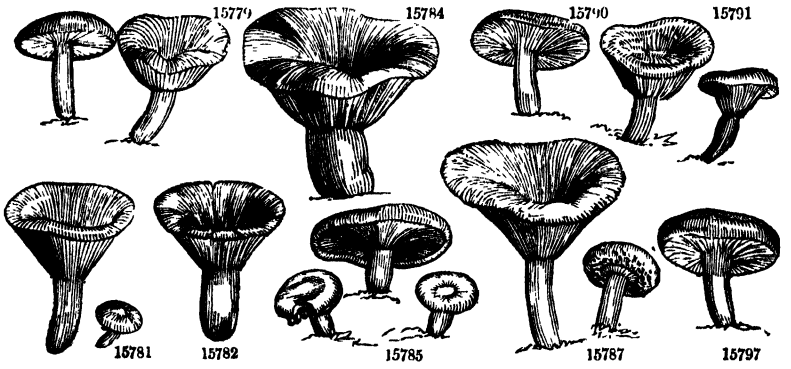
***** Cap always dry, smooth, with a thin, floccose, frosted, involute edge, Flesh soft, Gills rounded, clustered, obliterated in front, Stalk united with cap*

15770 Somew cæspitose, Pileus smooth unequal cinereous, Lamellæ round white, Stipes solid powdery at end
15771 Somew cæspitose, Pileus compact smooth mouse-colored, Lamellæ emarg and solid downy, Stipes white
15772 Cap somewhat compact smooth with a villous frosted margin, Lamellæ rounded loose and solid somew bulbous villous, Stem rather violet
15773 Gregarious, Cap thin smooth lilac-brown, Lamellæ rounded pale violet, Stipes solid equal naked
15774 White not spotted, Cap equal smooth, Lamellæ rounded dense, Stipes solid elastic
15775 Cap conical shining, Lamellæ loose white, Stipes solid white

** Gills all equal, Sporidia yellow*

15776 Cap somewhat compact: the margin finally furrowed, Lamellæ broad equal tanned
β Stipes yellow

15777 Middle-sized, Margin of cap smooth, Lamellæ narrow compact equal: the color of yolk of egg
15778 Cap thin with a sulcate margin, Lamellæ broad subdistant equal yellow



and Miscellaneous Particulars

They differ much in habit among each other. The annulus is either *superior*, that is reflexed from the top of the stipes; or *inferior*, that is contiguous to the middle; or even *proper*, being inserted above the middle

§ 4. *Limacium.* So called from *A. limacinus*, a name which has been indiscriminately applied to almost all the species of this subgenus. They are fungi of a middle size, solitary, terrestrial, autumnal, and permanent.

§ 5. *Tricholoma.* From θριξ, hair, and λωμα, a margin. The species are large, robust, and permanent, solitary or gregarious, and terrestrial. Many are eatable; some have an acrid bitter flavor. A Russula is said to be of excellent quality.

History, Use, Propagation, Culture,

§ 6. *Russula* So named from the *russet* color of the original species The species are all large, or of middle size, rigid, persistent, solitary, terrestrial, chiefly appearing in the autumn.

§ 7. *Galarhæus.* From γαλα, milk, and ῥεω, to flow, many of the species being lactescent; some are juiceless. These are fungi of the summer and autumn, possessing an aromatic smell and acrid flavor. They all grow upon the ground A. torminosus, in times of scarcity, is eaten by the Russians, mixed with salt, oil, and vinegar. *Buxb* A controversus is stated by Persoon to be eatable, but Fries thinks it must be in mistake. A. deliciosus has gills decurrent, flame-colored, narrow, regularly branched; pileus rich, red, brown, flesh nearly flat, but somewhat hollowed at the centre, and the edge turned in from one and a half to three inches over; orange-color, stem orange, solid, tapering downwards, from one to two inches high, and a quarter to three-eighths high: hollow with age. The juice is rich yellow, which soon turns green. It is found in the fir plantations of Scotland, and in those of the barren hills at Barr, in Staffordshire. Dr. Smith also found it at Hillingdon, Middlesex, under some fir trees, it also grows near Guildford. It is much esteemed in Italy, and exposed in the markets, and supposed to have been the A caesareus mentioned by some authors.

15779 Cap compact somew. depressed in centre with marg. at length sulcate, Lamellæ broad subeq. very white

** *Gills nearly equal, Sporidia white.*

15780 Cap deformed opaque pallid; margin finally striated, Lamellæ distinct whitish, Stipes finally cinereous

*** *Gills forked, and many of them halved.*

15781 Very hot, Cap very red · margin smooth, Lamellæ forked white
15782 Acrid stinking, Cap yellow margin warted furrowed, Lamellæ connected and hollow, Stipes white
15783 Scentless, Cap greenish · margin smooth, Lamellæ forked white [thick Stipes short solid very robust
15784 Large, Pileus depres ash color olive at length dark and as if burnt: marg smth Lam. uneq. dist. white
β Cap brownish-yellow, Lamellæ yellowish-white, Stipes solid white

* *Edge of the cap rolled inwards, downy* HOT POISONOUS.

15785 White, Pileus villous blood-red variegated downy at edge, Stipes solid
15786 Cap yellow without zones margin bearded, Milk yellowish, Stipes hollow spotted
15787 Cap glabr pale with a yellowish brownish or greyish tinge marg toment Stipes most holl in part smth.
15788 Cap smooth zoned olive-brown margin villous, Stipes solid
15789 Cap downy dull flesh-colored, Lamellæ yellowish, Stipes rather hollow

** *Cap smooth, viscid, with a naked edge* HOT EATABLE

15790 Cap viscid zoned lurid, Lamellæ white, Milk reddish, Stipes hollow
15791 Cap viscid not zoned cinereous-sooty, Lamellæ yellow, Milk turning red, Stipes solid
15792 Cap viscid not zoned fleshy livid or brownish, Lamellæ white, Milk whitish-lilac, Stipes hollow
15793 Cap thin smooth somew viscid not zoned livid pale, Lamellæ and milk whit Stipes somew hollow fragile
15794 Cap viscid not zoned smooth flesh-colored, Lamellæ and milk white, Stipes hollow spotted
15795 Cap viscid somewhat dripping not zoned greenish, Lamellæ and milk white
15796 Cap viscid smooth not zoned and stipes (which is short) hollow and firm pallid, Lamellæ and milk white
15797 Cap glutinous obscurely zoned dingy-orange or reddish very pale when dried, Lamellæ and juice orange, Stipes becoming hollow glabrous
15798 Cap somew viscid not zoned orango-colored, Lamellæ compact yellowish, Milk white, Stipes long smooth

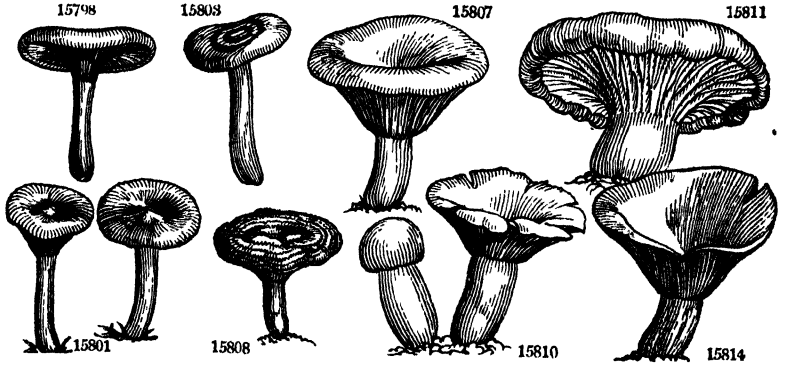
*** *Cap dry, naked at edge, Gills close, when young white, afterwards yellow* EATABLE *but* ACRID.

15799 Sweet, Cap papillose smooth dry orange-colored, Lamellæ paler, Milk white, Stipes long hollow
15800 Sweet, Cap obtuse smooth dry opaque, Lamellæ testaceous rufous, Stipes solid firm brownish

15801 Cap glabrous polished reddish, Lamellæ flesh-colored at length ferruginous, Juice white not changing color, Stipes firm smooth becoming hollow
15802 Somewhat acid, Cap dry smooth somewhat zoned rufous brown, Milk yellow, Stipes solid
15803 Acrid, Cap dry smooth obsoletely zoned pale-yellow, Lamellæ pale flesh-color, Stipes solid
15804 Very acrid, Cap dry umbonate polished reddish-brown, Lamellæ rufous, Milk white, Stipes solid

15805 Acrid, Cap bluntish scaly dry red-ochre-colored, Lamellæ ochraceous, Stipes nearly solid
15806 Cap thin scaly dry opaque somewhat lurid
15807 Cap large dry zonless dark fuscous or deep dingy-grey, Lamellæ yellowish rather numerous, Juice white

**** *Cap dry, naked at edge, Gills not altering, Substance compact, tough* VERY ACRID



15808 Cap dry smooth somewhat zoned livid, Lamellæ distant yellow, Stipes hollow cinereous
15809 Cap repand dry smooth, Lamellæ distant pallid, Stipes short pallid [white very acrid
15810 Cap depress becom infundibulif glab whit Lamel very narrow crowded, Stipes solid white thick, Juice
15811 White, Cap umbilicate downy rigid, Lamellæ narrow distant, Milk white, Stipes solid thick
15812 All white sweet, Cap convex, Stipes long
15813 Seems to be a green variety of A hysgynus, with a solid stipes

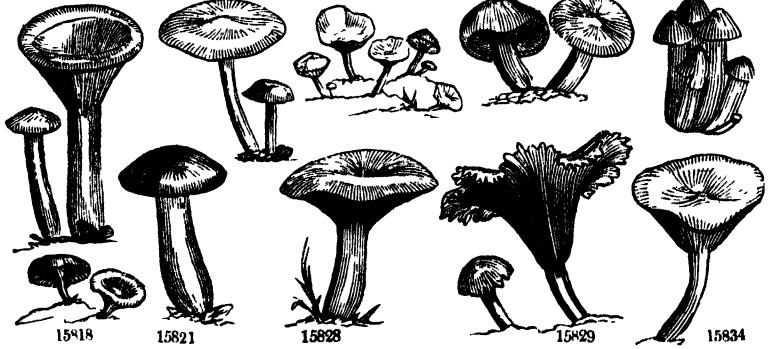
A *Gills equally narrowed backward, acute*

1 *Cap dry, smooth, Gills close, decurrent or acutely adnate.*

* *Cap more or less fleshy, when young convex-deflexed, when older depressed, Gills truly decurrent*

15814 Very large whitish or very pale brown, Cap becoming infundibuliform, Lamellæ numerous decurrent becoming reddish, Stipes solid very thick

and Miscellaneous Particulars.



Dr. Withering enumerates three varieties, one of which affords, from every part of it when wounded, a copious discharge of yellow acrid juice. They are gathered in woods and dry pastures in September and October

Læsel asserts in his Flora Prussica, p 82., that "the juice of A. piperatus, mixed with the syrup of mallows, is a certain cure for calculus, and a powerful diuretic." Almost all the venemous fungi, and especially those of the present group, are said to be the favorite food of the goat, during the rutting season. It is sometimes monstrous and irregular Withering mentions their attaining the diameter of ten inches. The stipes is not unfrequently thicker than it is long It has been used in medicine, and thought useful in dissolving calculi, a property we may safely venture to deny it.

§ 8 *Clitocybe* From κλίτος, inclined, and κυβη, a head. Most of the species are harmless, and of the larger size A nebularis is eatable, so also is A fusipes A giganteus is one of the species which form those circles known by the name of *Fairy-rings*, the origin of which is still as obscure as ever

A areades has loose gills, with the part attached to the pileus jutting up very close to the stem, so as to give

History, Use, Propagation, Culture,

them almost the appearance of being fixed, watery, brownish-white, two or four in a set, the small ones very minute, and the large ones sometimes splitting at the outer end; not numerous, rather broad for the size of the plant, frequently connected to the pileus by ligaments; pileus pale, buffy-brown, convex, irregular, with a sudden depression of the border at some distance from the centre, often giving the appearance of a large rounded boss in the middle, central color generally deeper; from one to one and three-quarters inch over, and the edge turning up with age: stem solid, white, changing to watery-brown, cylindrical, but thicker and flattened just under the pileus, very tough, mostly crooked, twisted when dry, rarely central, one and half inch high, and thick as a crow-quill This is the twenty-seventh fungus of Ray's Synopsis, ed. 3 p. 6.; A pratensis of Hudson, and coriaceus of Lightfoot There are two varieties; one with cream-colored gills, buff pileus, and mealy stem; and another with yellow-brown, more fleshy, and more regularly convex pileus, found in groves. Mr. Woodward says, that this species has a much higher flavor than the common mushroom, but he suggests,

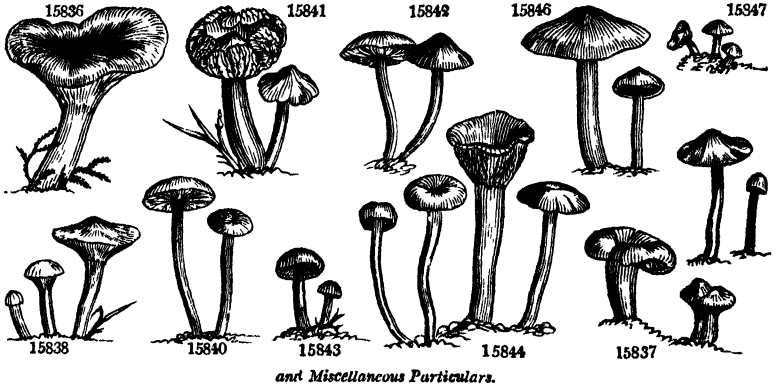
15815 Large, Cap convex umbonate at length infundibuliform smooth firm yellowish-white, Lamellæ numerous decurrent whitish, Stipes straight solid subradicating
15816 Cap thin funnel-shaped obt smooth flaccid, Lamellæ decurr whit Stipes solid thickened at base villous
15817 Cap umbonate smooth becoming funnel-shaped, Lamel decurr white, Stipes solid elastic taper. upwards
15818 Cap depressed broad zoned brown irregular, Gills decurrent pallid, Stipes solid
15819 Cap flatt somew. umbilic smth. a lit flesh-color · when dry whit Lam decurr. and solid eq Stipes white

** *Cap closely fleshy, convex, opening out flat, Gills truly decurrent, Stalk strong* EATABLE
15820 Cap compact smooth cinereous, Lamellæ slightly decurrent compact whitish, Stipes solid tapering upw

15821 Cap plano-convex very smooth greyish-brown, Lamellæ narrow numerous pale, Stipes hollow stout

*** *Cap truly but not firmly fleshy, flattish or slightly depressed, Gills adnate, not properly decurrent, Stalk slender*
15822 Cap smooth green, Lamellæ adnate narrow, and stipes (which is solid and smooth) white
15823 Fragrant smooth dull bluish-green umbonate convex becoming plane, Lamellæ numer adnato-decurrent
15824 Shining-white, Cap smooth convex then umbonate, Lamel adnate then decurr Stipes fistulous smooth
15825 Scentless white, Pileus unequal thin smooth, Lamellæ adnate numerous, Stipes solid equal glabrous

15826 Cap obsoletely umbonate smooth, Lamellæ adnate close white, Stipes solid furrowed smooth
15827 Cap somew umbon smooth brown Lamel affixed with hind end recurv Stipes solid equal strigose
15828 Cap obtuse smooth somewhat repand greenish-livid, Lamellæ adnate, Stipes solid smooth [short
15829 Dirty-white, Cap becom funnel-form smth marg sinuat and lob Lam adnate very tender, Stipes solid

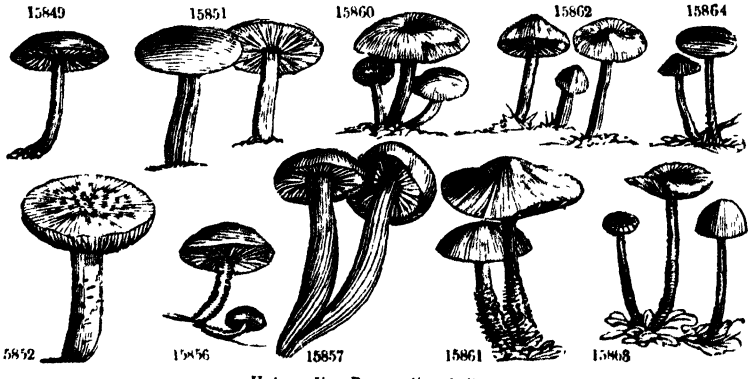


**** *Tufted, variable, some growing on wood, some on earth*
15830 Cap irregular rather out of centre vill whit Lamel adn compact white, Stipes solid flexu vill. at base
15831 Cap flat discoid viscid, Lamellæ decurrent and solid tapering, Stipes white
15832 Cap conical powdery rufous, Lamellæ decurrent and solid ventricose powdery, Stipes rufous

15833 Cap whit-brown, Stipes solid obconic scarcely broader at top than bottom, Lamel decurr. branch white
15834 Cap dead white nearly flat, Lamellæ white numerous, Stipes white with brown pith
15835 Whitish, Cap convex, Lamellæ decurrent, Stipes solid subconical

2 *Cap somewhat compact dry, Gills very distant, arcuate, decurrent*
15836 Cap somewhat compact streaked sooty, Lamellæ decurrent white-glaucous, Stipes long stout fibrous
15837 Firm, Cap compact convex becoming partially expanded smooth brownish-buff with a pink tinge, Lamellæ decurrent thick, Stipes short solid attenuated below
β All white
γ Cap thinner with a striated margin
15838 Viscid, Cap campanul expand when humid striated, Lamel adnate somew distant, Stipes equal smooth

3 *Cap thin, viscid, wet, Gills variable, Stalk hollow* TERRESTRIAL.
15839 Green chang to yell Pileus campanulate spreading, Lamellæ adnate rather distant, Stipes equal smooth
15840 Cap nearly plane slimy substriate yellow, Lamellæ adnate decurrent distant, Stipes rather unequal gradually attenuated towards the base
15841 Cap conical glutin mostly yell or crim Lamel crowd ventric attenuat and free, Stipes substriate splitt
15842 Cap campanul obt lob orange-red, Lamel affixed ascend yellow, Stipes thick ventricose white at base
15843 Cap conv expand visc becom depres Lam adn versicolor connect by decurr. tooth, Stipes compr scarlet



B *Gills unequal at the back, that is, toothed, or arcuate, decurrent, sinuate, emarginate, &c*
4 *Cap dry, minutely scaly, Gills generally arcuate, decurrent, rarely adnate* FIRM
15844 Gregarious, Cap scarcely fleshy tough farinaceous with minute scales pale or deep flesh-color disk depressed in age, Lamellæ distant, Stipes long elastic
β Cap convex becoming depressed somewhat squamulose purple, Lamellæ distant thick violet-purple, Stipes purple, hollow when old
15845 Cap fleshy plano-convex somew scaly brown Lamel arcuate affix connect whit Stipes solid short firm
15846 Cap fleshy somewhat umbonate slightly silky testaceous, Lamellæ arcuate adnate somewhat distant and solid equal, Stem sulphur-colored
15847 Lamellæ brown changing to purplish, Cap red-brown convex turning up with age, Stipes brownish
15848 Lamellæ brownish-white, Cap cinnamon bossed, Stipes brownish-white cylindrical

and Miscellaneous Particulars.

that from its leathery nature it is indigestible, except in the form of powder, in which it is admirable. Dr Withering, however, observes, that he has seen the pileus and gills of this agaric very brittle and tender when fully saturated with moisture in rainy seasons, and in that state it is sufficiently digestive Professor Martyn informs us that he has eaten these mushrooms for forty years without injury, and without perceiving that toughness, like leather, of which others have complained, except in very dry weather, or when they are in too advanced a state They should be gathered young, and early in a morning, and properly dressed They are found in hedge banks, upland pastures, and sheep commons, particularly in those patches called Fairy rings. Those that are found in woods and hedges are of inferior flavor to such as are gathered in dry pastures, which have a very pleasant smell and luscious flavor, either when stewed alone or in ragouts, &c This sort makes excellent ketchup, and is much valued in the form of powder It is in season during September and October, but may be dried so as to be in use for the table all the winter. Mr. Lightfoot supposes that this species is the

History, Use, Propagation, Culture,

mouceron of the French, who use it in ragouts instead of that, and acknowledge it to be equal in flavor, but more tough The mouceron, however, has a very thick and fleshy pileus, its gills are very narrow and numerous, and fixed to the stem, and the stem is thick and short. Dr Withering has carefully distinguished several other species from this fairy-ring agaric, or Scotch bonnets, as it is called by Mr. Ray

5. Cap smooth, somewhat humid, Gills arcuate at their connection with the edge, reticulated at their union with each other, with appendages at edge.

15849 Cap convex livid-purple striat. at edge, Lamel arcu.-annex. purple with black teeth, Stipes fistular equal

6 Cap thin, dry, Gills emarginate. BRITTLE

* *Cap fleshy, smooth, and stem regular* TERRESTRIAL.

15850 Cap fleshy soft flatt. smooth, Lamel clustered somew. ventricose white, Stipes somew. holl. long and thin

** *Cap somewhat fleshy, and stem, which has no roots, irregular.* TERRESTRIAL.

15851 Cap subcarnose irregular smooth thin fuscous, Lamellæ distant white, Stipes hollow-whitish compressed
15852 Cap fleshy deform. crack. scaly cinereous, Lamel glued together dist. and deform. holl. Stipes cinereous

*** *Cap somewhat fleshy, and stem, which has roots, regular* GROWING ON WOOD.

15853 Cap fleshy flat somew. streaked cinere -whit. Lamel. very broad dist. and solid equal striat Stipes white

C Gills equal, behind blunt

7 Cap fleshy, glutinous, Gills somewhat united, Stem rooted.

15854 Cap rugose glutinous tough, Lamellæ white, Stipes tall rigid with a long fusiform root
15855 More slender, Lamellæ sinuated with a decurrent tooth, Stipes very long [blackish towards base
15856 Cap nearly plane brown orange glutin Lamel ventric. yellow Stipes incurv. velvety and redd.-brown or

8 Cap tough, dry, Gills separate, close, white

15857 Gregarious, Cap fleshy loose, Lamel somew. separate serrat Stipes hollow ventricose furrow whit root.
15858 Confluent cæspitose, Cap somewhat fleshy whitish, Lamellæ loose compact, Stipes fistulous somewhat compressed red villous powdery
15859 Cap somew fleshy campanul expanded umbonate pallid, Lamel loose, Stipes fistulous smooth glabrous
15860 Variable, Cap thin watery smooth plane sometimes depressed, Lamellæ free soft, Stipes hollow splitting becoming thicker towards the base pinkish or yellowish-white more colored at the summit

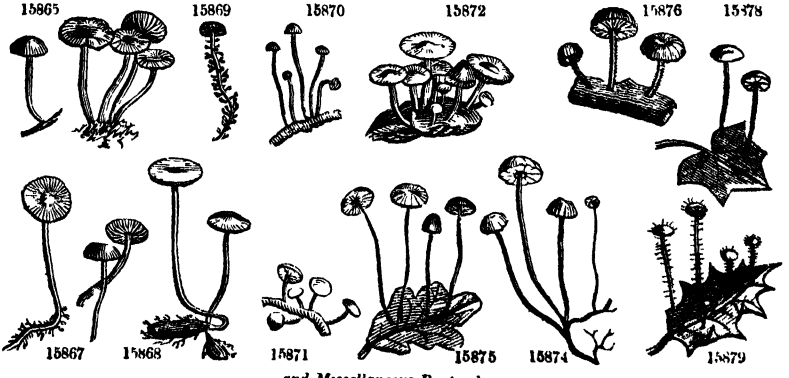
9 Cap somewhat leathery, dry, Gills separate, distant, pallid.

* *Cap fleshy, Stem solid*

15861 Cap dry leathery convex at length plane, Lamellæ distant pale-reddish or buffish, Stipes solid clothed towards the base with a woolly or strigose mass
15862 Cap tough subumbonate reddish becoming buffish or very pale opake, Lamellæ distant whitish, Stipes solid firm cylindrical thickest under the pileus pale

** *Cap fleshy, Stem fistulous*

15863 Strong smell Cap somew fleshy smth and lamellæ somew loose white, Stipes fistular long downy rufous
15864 Cap somewhat fleshy wrinkled dark-purple becom pale, Lamellæ loose rufous, Stipes fistular rubiginous

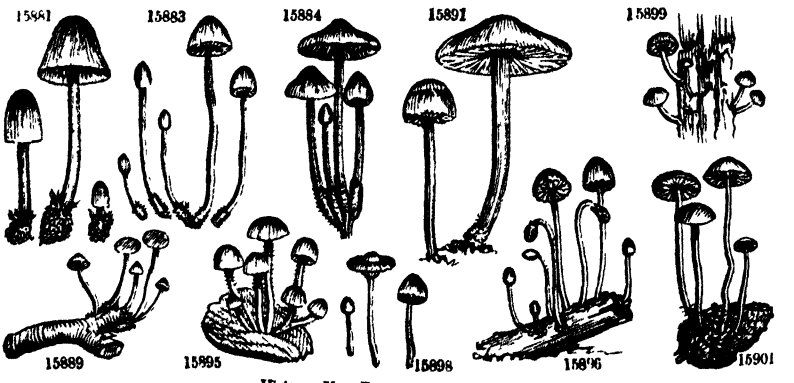


1 Cap slightly fleshy, smooth, scarcely umbilicate, Gills tenue, Stem hollow, or somewhat fistulous

15865 Strong smell Cap somew fleshy, and lamellæ adnate crisp whitish, Stipes fistular short glabrous rufous
15866 Cap somewhat fleshy smooth pinkish-red, Lamellæ attached white, Stipes nearly solid short scaly

15867 Cap somew. fleshy obt. clay-colored, Lamellæ attached lax white, Stipes fistular rooting smooth yellow
15868 Cap plane or somewhat umbonate, Lamellæ adnate numerous, Stipes subfistulose slightly tomentose at the base and springing from a reddish tuberous root
15869 Cap membranous papillose grey, Lamellæ white, Stipes racemose
15870 Cap plano-convex reddish-orange, Lamellæ white rather broad fixed, Stipes very slender subsolid whitish
15871 Gregarious, Cap nearly plane white sometimes changing to reddish, Lamellæ adnate white, Stipes short minutely furfuraceous marked within with a white line
15872 Cap somewhat fleshy convex becoming flat prunose pale-grey, Lamellæ attached thick distant more obscure, Stipes fistular villous

2. Cap thin, membranous, flat, becoming depressed, plaited, rugose, Gills veiny, of the same substance as the cap, Stem horny, black



15873 Cap flat plaited, and lamellæ (which are very broad adnate and distant) white, Stipes solid smooth brownish thicker and paler towards the extremity
15874 Cap conv umbilic plicate, Lam attach to a collar surround stipes white, Stipes holl striate black below
15875 Cap convex plicate white sometimes tinged with brown, Lamellæ simple adnate white, Stipes hollow furrowed very glabrous purplish-brown or black except at the summit
15876 Cap convex umbilicated plicate redd -brown, Lamel adnate pale-yellow Stipes holl redd -brown velvety
15877 Cap flatt rugul pall Lam adnate simp many being halved, Stipes smth fistular velvety blackish-brown
15878 Cap nearly plane rugose, Lamellæ few adnate resembling white prominent veins, Stipes hollow very minutely velvety reddish-brown below
15879 Cap convex-expanded whitish and rufous, Stipes covered with straight red hairs, Lamellæ whitish

and Miscellaneous Particulars

History, Use, Propagation, Culture,

§ 10. *Mycena.* From *μυκης*, a kind of small fungus The species are of the smaller kind, at least they are thin and slender, and tolerably permanent. None of them are fit for food; many are distinguishable by their smell, which is always powerful.

1. *Dry, Cap generally umbonate, not depressed, Gills separate or adnate, not decurrent.*

* *Stem rooting, smooth, juiceless, Gills separate, whole-colored.*

15880 Cap becoming nearly plane subcoriaceous, Lamellæ free whitish, Stipes tall covered with a sort of bloom dark purplish-brown below velvety at the base

15881 Cap smooth blackish Margin and lamellæ loose whitish, Stipes tumid at base, strigose

** *Stem smooth, juiceless, somewhat rooting, Gills adnate, whole-colored.*

15882 Cap obtuse striated cinereous, Lamellæ adnate glaucous white, Stipes smooth firm villous at base

15883 Cap brown Lamel. whit adnate with a decurrent process, Stipes smth. tenacious strig at base and radicat.

*** *Stem juiceless, striated, Gills whole-colored.*

15884 Cap obscurely striate blue.-grey, Lamel attenuated and subadnate whit. Stipes long rigid striate glisten.

**** *Stem smooth, milky, somewhat rooting, Guls attenuated, united at the edge*

15885 Cap striated blackish glaucous, Lamellæ affixed white, Stipes filled with white juice

15886 Cap fleshy-membranous whitish-red, Lamellæ affixed, and stipes filled with dark-red juice

15887 Cap striated reddish-brown, Lamellæ adnate whole-colored at the edge, Stipes filled with red juice

***** *Stem smooth, juiceless, somewhat rooting, Gills adnate, discolored at edge.*

15888 Cap striated livid-yellow, Lamellæ adnate linear livid margin yellow, Stipes rigid smooth fibrous at base

15889 Bright-red, Cap acutely umbonate with a striate margin, Lamellæ fixed dilute reddish, Stipes firm strigose and pale at the base

15890 Cap between fleshy and membranaceous convex pale rose-purple, Lamellæ ventricose rather paler than pileus, Stipes smooth villous at the base

***** *Stem smooth, juiceless, scarcely rooting, Gills affixed, whole-colored* COLOR PURE

15891 Cap between fleshy and membranous obtuse somewhat rose-colored, Lamellæ round ventricose pallid, Stipes smooth villous at base

15892 Cap obtuse smooth, Lamellæ adnate white, Stipes smooth rootless

15893 Cap umbonate striated and slender, Stipes yellow, Lamellæ adnate white

15894 Cap somew umbonate striated yellowish-white, Lamel affixed distinct, and stipes rigid smoothish white

****** *Stem juiceless, rootless, but swollen at base into a globe, Cap blunt.*

15895 Pale-brown, Cap conical smooth, Lamellæ loose compact, Stipes thickish hairy

2 *Cap or stem viscid, Gills adnate or decurrent*

15896 Cap obtuse striated and elongated, Stipes yellow viscid, Lamellæ uncinate

15897 Cap umbonate becoming depressed striated cinereous, Lamellæ decurrent white, Stipes short firm viscid

3 *Dry, Cap finally depressed, Gills decurrent*

* *Firm, persistent, with a firm stem*

15898 Cap somewhat membranous campanulate striated at edge, Lamellæ decurr very broad, Stipes solid thin

** *Delicate, withering, with a capillary stem*

15899 Cap thin hemispher becom umbilicat and striat Lamel uncin decurr dist. Stipes short incurv smooth

15900 Thin rosy, Cap campanulate smooth, Lamellæ broad distant, Stipes capillary with a strigose bulb

15901 Slender, Stipes slender with stiff wool at base, Cap depressed hemispherical

1 *Cap somewhat membranous, Gills decurrent.*

* *Small, Cap membranous*

15902 White, Cap convex smooth, Lamellæ distant, Stipes attached to the base of a convex radiat membrane

15903 Cap convex glabrous orange-yellow, Lamellæ whitish distant, Stipes yellowish

15904 Testaceous rufous pallid, Cap funnel shaped disk smooth, Lamellæ narrow, Stipes firm

15905 Cap convex umbilicated striate, Lamellæ broad pale, Stipes solid short thickish [at the base

15906 Cap depress in centre marg turned down striate, Lamel dist rather broad white, Stipes short pubesc.

15907 Stipes solid thickened at base ferruginous downy

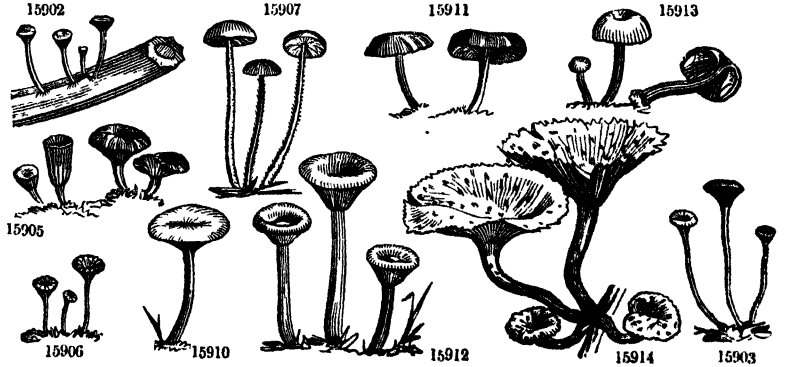
** *Large, Cap somewhat membranous*

15908 Tender cinereous blackish, Cap funnel-shaped striated, Lamel lin Stipes somew solid tough vill at base

15909 Thin pale cinereous, Cap somewhat funnel-shaped smooth oblique, Stipes thick

2 *Cap fleshy, membranous, Gills adnate*

15910 Odor Cap nearly plane pale yellow or brown-white when dry, Lamel numer whit Stipes holl white

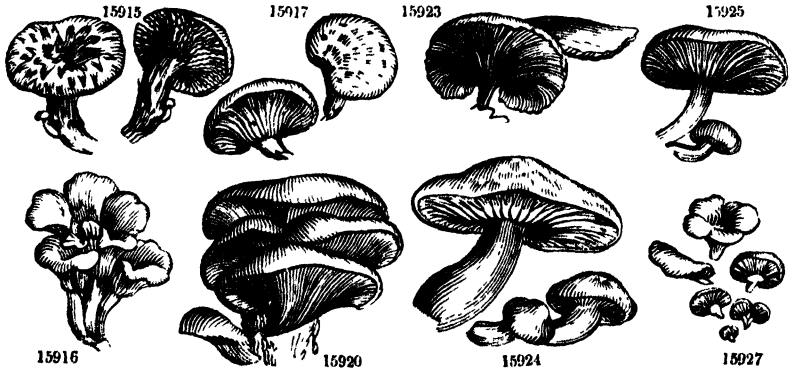


15911 Livid, Cap somewhat membranous plane striated, Lamellæ distant, Stipes fistular [attenuat above

15912 Cap somew fleshy funn-shap smooth dark-brown grey. marg reflexed, Lamel dist grey Stipes elastic

15913 Cap thin campanulate green at centre brown and plaited at margin, Stipes smooth hollow

3 *Cap fleshy, coriaceous, somewhat corky, soft, Gills decurrent*



15914 Cap regular umbilicat whitish with black hairy scales, Lamel denticul white, Stipes thin minutely scaly

and Miscellaneous Particulars

§ 11 *Omphalia* From ομφαλος, the navel, in reference to the young form of the pileus. Many of the species are of the smallest size. None are eatable.

History, Use, Propagation, Culture,

§ 12 *Pleurotus* From πλευρα, the side, the pileus is always inserted out of the centre. A tribe of perennial, innocuous, often eatable fungi, always found upon trees

§ 13 *Mouceron.* An old French name of certain eatable fungi This, no doubt, is the origin of our word Mushroom. A prunulus is said to be one of the very best of mushrooms; it is common in woods, among grass.

§ 14. *Clitopilus* A name analogous to Clitocybe, § 8, as the group is also Species of the middle size, nearly destitute of smell, mild, but not used as food.

15915 Cap compact unequal pale ochraceous, Scales spot-like more opaque, Lamellæ torn, Stipes stout scaly
β Stipes long curved, Cap small
15916 Cap tough somewhat lobed twisted smooth rufous, Lamellæ toothed pallid, Stipes firm furrowed rufous

1. Veil universal, Cap compact, horizontal

15917 Hard, Cap oblique smoothish whitish, Scales brownish, Veil fugacious

2. Veil none, Cap fleshy, Gills decurrent

* *Cap always entire*

15918 Cap tough depressed reddish tan-color, Lamellæ rather crisp paler, Stipes short grey downy

** *Cap entire or halved*

15919 Cap tough deformed pink cinnamon-color, Lamel entire and short irregul Stipes downy at base and pallid
15920 Tufted, Stipes sublateral or none, Cap smooth fleshy pale blueish-grey or brown, Lamellæ whitish often anastomosing at the base

*** *Cap always halved, somewhat ascending*

15921 Ascending, Cap spatulate whitish-brown, Disk and stipes somewhat villous, Lamel. compact lin. white
15922 White, Cap ascending sessile ear-like glabrous, Lamellæ narrow linear quite entire
15923 Cap flattish smooth pale-brown, Margin and lamellæ crenate, Stipes short or none

3 Veil none, Cap fleshy, when young horizontal, Gills terminating in a determinate manner.

15924 Cap compact smooth pale whitish, Lamellæ adnate or subdecurrent whitish, Stipes strong ascending incrassated at the base excentrical
15925 Cap smooth rufous, Lamellæ adnate of the same color, Stipes out of the centre smooth whiter
15926 Cap comp. somew. visc olive-green, Lamel. adnate comp pallid, Stipes short rather on one side sooty scaly
15927 Cap coriaceous reniform rather tan-colored, Epidermis separating into scurfy scales, Lamellæ veiny connected, Stipes lateral frosted

4 Cap fleshy, when young resupinate, Gills running together in a point out of the centre

15928 Cap fleshy reniform downy yellowish, Lamellæ orange-yellow
15929 Cap fleshy scaly mouse-color, Upper stratum gelatinous, Lamellæ greyish-white
15930 Cap soft smooth gibbous pale-yellow brown, Lamellæ pale reddish-brown somew ventricose, Stipes none
15931 Cap membranaceous white cottony at first subresupin at length reflexed, Lamel whit afterw pink buff
15932 Cap fleshy smooth umber-colored the upper layer gelatinous, Lamellæ pale becoming yellow

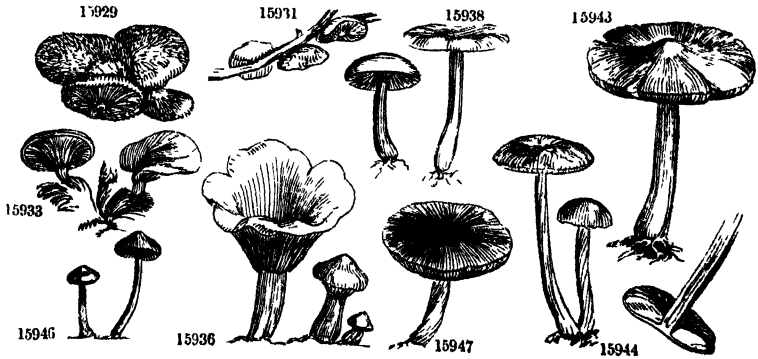
5. Cap membranous, Gills adnate, or running together in one point

15933 Cap reniform diaphanous, Lamellæ linear, Stipes marginal ascending villous [like Byssus
15934 Cap at first resupinate afterw reflex smooth downy, Lamel radiat Stipes thin incurved downy, Roots
15935 Cap subsessile. at first resupinate, afterwards reflexed frosted villous at base, Lamellæ lax

15936 Cap compact flattish white, Lamellæ white becoming pink

1 *Gills affixed* TERRESTRIAL

15937 Cap somewhat umbonate sooty black Lamel flat decurr twist whit Stipes hollow thickened downwards
15938 Cap somewhat umbonate silky livid, Lamellæ adnate whitish rose-colored, Stipes hollow smooth white
15939 Cap somew umbon smooth livid pale, Lamel annexed flesh-colored, Stipes solid smooth somew bulbous
15940 Broad, Cap smooth yellowish-white, Lamellæ loosely attached very broad rufous, Stipes solid equal white
15941 Small, Cap convex and stipes white, Lamellæ adnate



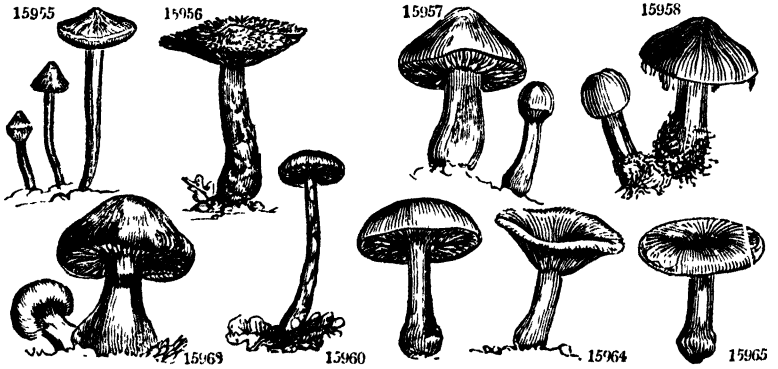
2 *Gills altogether distinct* UPON WOOD

15942 Cap somewhat membranaceous smooth yellow, Stipes solid striated
15243 Cap fleshy smooth blackish soot-color, Stipes firm with black fibres
15944 Cap convex at length plane clear olive or yellowish-brown smooth but minutely rug as if veined towards the centre, Stipes hollow rather twisted, Lamellæ ventricose

15945 Cap scaly grey-lilac colored, Lamellæ loose, Stipes hollow fibrous cæsious
15946 Cap somewhat squamose blue, Lamellæ bluish-white adnate at length purple, Stipes solid smooth bluish

15947 Cap irregular smooth somew. cinnamon-colored, Lamel. loose toothed rosy, Stipes hollow twisted striated
15948 Cap campanul. expanded black soot-color when dry paler and silky, Lamel. almost loose dirty flesh-col.

15949 Cap fibrous scaly livid-grey, Lamel adnate and fistular, Stipes (which is white with wool at the base) paler
15950 Cap squamulose umber-colored, Lamellæ sinuate affixed purplish, Stipes solid short
15951 Cap smooth with a striated edge and the fistular equal, Stipes livid, Lamellæ decurrent
15952 Lamellæ salmon-colored not numerous, Cap and stem white



and Miscellaneous Particulars

§ 15 *Leptonia* From λεπτος, slender Small permanent, elegant, scentless, insipid, not used for food. They are in perfection at the end of summer

§ 16 *Nolanea* From *nola*, a bell. Terrestrial, various, of a thin watery substance, insipid, not eatable Easily distinguished by their habit.

History, Use, Propagation, Culture,

§ 18 *Telamonia* So named on account of their gigantic stature The species are among Agarics what Ajax Telamonius was among men Large, terrestrial, firm species, none of which are eaten. The species of this and the next subgenus are extremely difficult to determine, not only on account of their size, but of their colors, which vary exceedingly at different periods of their growth, as well as according to their situation. Their colors are also intermediate between fulvous, testaceous, cinnamon, &c, which are very difficult to describe The most constant marks are, first, smell, second, surface of pileus being fibrous or viscid, third, the situation of the lamellæ, whether they are compact or distant, and fourth, their color in the young state, in which it must be observed, that they are always described

The A. bulbosus of Hudson and Ray is referred by Withering to A violaceus of Linnæus, which has fixed purple gills, numerous, eight in a set, long gills, sometimes cloven, and a few of them decurrent. purple pileus, soft, smooth, firm, convex, but centrally depressed with age, and cracking at the edge, which is somewhat turned down, from half an inch to five inches over stem solid, cylindrical, purple, bulbous at the base, from one to four inches high, and from a quarter to one inch in diameter, and curtain like a cobweb In maturity it plentifully emits a powder of the color of Spanish snuff It is not uncommon from October to December, in Edgbaston and Barr plantations, in the woods near Bath, and at Powick, near Worcester. With much broiling and duly seasoned, it is esteemed as delicious as an oyster Another variety, which is the A varius of Bolton, is found on grass-plats and new mown fields in July It has chocolate gills, from brown to black,

15953 Cap obt. fibrous hoary testac Lamellæ adn purple, An annulus sheath stipes which is violet at upp end
15954 Cap bluntly umbon somew. fibr pale umb.-col Lamel. adnate umb.-col Stipes somew bulb. striat paler

15955 Cap somew fleshy purp.-brown becom fibrous testac and hoary, Lamel violet-pur Stipes long eq violet
15956 Cap scaly testaceous olive-color, Lamellæ yellowish cinnamon, Stipes bulbous scaly, Veil fuscous
15957 Cap obtusely umbon smth bright-brown when dry testac. Lamel. cinnam Long bulb. stipes and veil white

1 *Cap always dry, scaly, or fibrous, obtuse or umbonate, never depressed*

15958 Cap very convex dull or brownish-violet, Lamellæ distant violet, Stipes spongy greyish violet within
15959 Cap umbonate squarrose with hairy sooty scales, Lamellæ compact violet becoming clay-colored, Stipes scaly transversely banded with black
15960 Cap umbon. smooth pale-brown, Lamel compact violet discolor Stipes taper varieg with brown scales

2 *Cap smooth, humid, viscid, always obtuse, finally depressed, Stem blue, becoming white.*

15961 Cap equal viscid, Lamellæ compact olive-purple, Stipes attenuated bulbous
15962 Cap equal viscid smooth, Lamellæ compact violet-purple, Stipes bulbous becoming white from violet
15963 Compact rounded, Cap olivaceous or brownish-grey glutinous while young, Lamellæ reddish-brown tinged with violet, Stipes thick tinged with violet
15964 Firm, Cap yellow somew scaly humid viscid, Lamel compact serrat whit.-cæsious, Stipes tapering white
15965 Cap smooth viscid yellow or tawny, Lamellæ compact quite entire yellowish-cinnamon, Stipes bulb. white

1. *Cap scaly or fibrous, Stem same color as the cap or paler.* GROWING ON THE EARTH

* *Cap fleshy, at first convex*

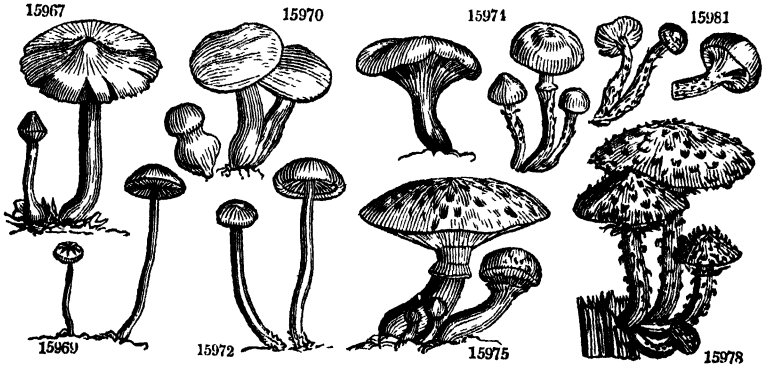
15966 Cap slightly fleshy somew. scaly, and stipes (which is thin and [illegible]) dull sang Lamel affix more dull-color.
15967 Cap glabrous subcarnose obtusely umbonate cinnamon-color, Lamellæ numerous adnate yellow-cinnamon, Stipes yellowish rarely straight
15968 Cap pale reddish-buff umbonate subfarinaceous, Lamellæ cinnamon-color broad numerous, Stipes whitish often with a few remains of the veil attached

** *Cap somewhat fleshy, at first campanulate.*

15969 Cap somew fleshy becom umbon smoothish brown-purple, Lamel affix ventric ferrugin. Stipes fuscous

2. *Cap smooth, but with a few surface-fibres, Stem white* GROWING ON THE EARTH.

15970 Cap bluntly umbonate pallid, Lamellæ compact cinnamon-colored, Stipes solid tapering upwards white
15971 Cap somewhat fleshy convex becoming bluntly umbonate chesnut-colored, Lamellæ affixed compact violet-testaceous, Stipes short firm



3 *Cap smooth, dry, Gills affixed.*

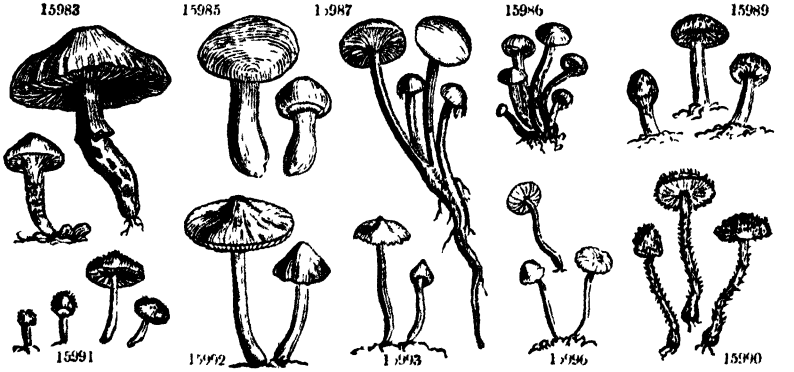
15972 Cap convex humid orange-colored or fulvous, Lamellæ yellow, Stipes hollowish
15973 Lamellæ brown-yellow, Cap deep-yellow bossed in the centre, Stipes scored yellow thickest downwards
15974 Lamellæ reddish-buff, Cap pale-yellow bossed, Stipes pale-yellow

15975 Fulvous, Cap fleshy scales few hairy, Lamellæ annexed, Stipes solid smooth, Annulus small
15976 Cap pitted lemon-colored hairs white, disk uniform with scatter scales towards disk, Stipes solid white
15977 Compact, Cap yellow scales scattered appressed, Stipes solid fibrous long-rooted
15978 Cap fleshy brownish or reddish-yellow scaly with fasciculat filam scales revol Stipes squarr with scales
15979 Cap fleshy dry yellow scales hairy scattered, Lamellæ at first yellow, Stipes equal squarrose

15980 Cap slightly fleshy obt fulvous-yellow vill with stalked scales, Lamel. adnate · at first yell. Stipes fistul.

15981 Cap scarcely fleshed glabrous striate when moist dull cinnamon-color becoming pale, Lamellæ subdecurrent numerous reddish-brown, Stipes hollow subincurved
15982 Cap yellow-brown bluntly conical, Lamellæ brown, Stipes brown scurfy, Veil permanent

and Miscellaneous Particulars



mottled, and in pairs, pileus mouse-color, conical, and pointed, stem of the same color, cylindrical, and firm This, though a common, is a very beautiful species In a summer morning it is covered with a bloom like that of a plumb, having often a glittering spangled appearance, its form is regular, and the fringe of the curtain peculiarly delicate. Another variety, with the stem of a dark mulberry color, is found in wet gravel where no grass grows, and sometimes on cow-dung, in which case the stem, under the shelter of long grass, is covered with a white hoariness which is easily rubbed off

§ 19 *Inoloma* A name with the same meaning as Tricholoma, § 5, to which the species are analogous. They are large, firm, somewhat succulent, autumnal, and terrestrial, but not as far as is known, eatable.

§ 20 *Dermocybe* From δερμα, a skin or membrane, and κυβη, a head, in allusion to the nature of the pileus. Analogous to Clitocybe, § 8 Of middle size, or small, scarcely eatable A cinnamomeus has gills, four in a set, broad about the middle, deep tawny red, and fixed by claws; pileus convex, but bossed, of a rich cinnamon color, from one and a half to three and a half inches diameter; the stem hollow, cylindrical, silky, shining, two inches high, thick as a goose-quill, of a fine full yellow color This is a species that is readily distinguished by its cinnamon color. It is found in woods in September and October, and has a good flavor

§ 21 *Pholiota.* From φολις, a scale Species of various habits. Some are terrestrial, others grow upon wood; some large, others of a smaller size.

History, Use, Propagation, Culture.

§ 22. *Myxacium* So called from μυξα, mucus, on account of the nature of its surface. The species are large, solitary, terrestrial, mucous, inodorous, and not eatable

§ 23 *Hebeloma* From ἡβη, down, and λωμα, a margin The only species has a nauseous taste. Its lamellæ are serrated, and distil drops of a peculiar fluid Its varieties are infinite Common in woods.

§ 24 *Flammula* So named in allusion to their color, which is a pale yellow, the color of a weak flame The species are gregarious, subcæspitose, firm, persistent, rather bitter, and all eatable A socialis and ilicinus are both eaten at Montpellier, where they are known by the names of *Prooulade d'rouse* and *Frigoule*

§ 25 *Inocybe* From ινα, fibres, and κυβη, a head. A tribe which can scarcely be compared to any other It consists of fungi of middle-size, or smaller, solitary, growing on the ground during the summer, and not known to be poisonous, although, on account of their nauseous odor, they are suspicious

§ 26. *Naucoria* Small gregarious epiphytous fungi, growing upon stipules, leaves, wood, and even muddy earth, fragile, and without any smell Their stature is that of Collybia, but their veil is of the same nature as that of Lepiota, resembling the kernel of a nut (*naucum*), whence they are named.

15983 Cap fleshy smth. orange-brown, Lamel pur : then ferrugin. Stipes part. across into bluish gelatin. scales
15984 Cap somewhat fleshy smooth, Lamellæ cinnamon-colored, Stipes long smoothish

15985 Cap somewhat repand opaque, Stipes scaly white, Sporidia clay-color

1. *Cap dry, Gills adnate, Tufted.* GROWING ON WOOD.

15986 Cap smooth yellowish, Lamellæ adnate yellow-ferruginous, Stipes fibrous
15987 Cap smooth yellowish, Lamellæ affixed yellow, Stipes fibrous pallid solid

2 *Cap viscid, Gills adnate, Not tufted.* GROWING UPON BOTH WOOD AND EARTH.

15988 Yellowish, Cap smooth viscid, Lamellæ adnate, Stipes hollow tapering at base

1. *Stem fibrous or scaly with fibres*

15989 Cap fleshy obtuse scaly brownish-grey, Lamellæ free or nearly so, Stipes solid fibrillose
15990 Cap somew fleshy hemispherical mouse-color, Stipes solid thin long scaly squarr. Lamel somewhat loose
15991 Cap somewhat fleshy convex scaly-villous, Lamellæ loose and solid then fibrous, Stipes solid

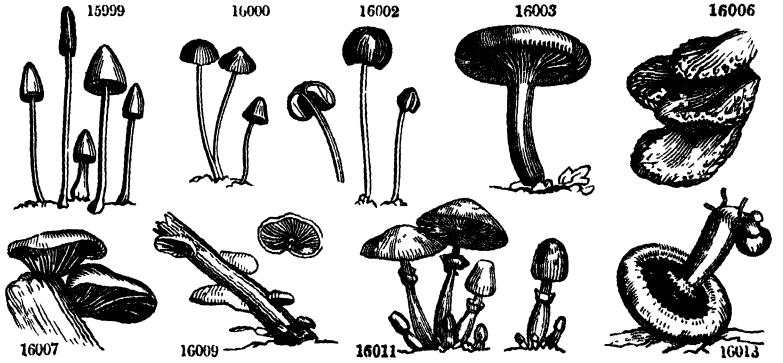
2. *Stem nearly at the top with white scales*

15992 Cap dry campanulate at length nearly plane surface splitting longitudinally pale shining-brown, Stipes solid somewhat tuberous at the base
15993 Cap conical at length expanded umbonate silky, Lamellæ subadnate, Stipes solid slender sprinkled with white pulverulent particles
15994 Cap yellow-brown scaly, Gills watery white irregular, Stem yellow-brown crooked scored

15995 Cap somew. fleshy scurfy scaly rufous cinnam.-color Lamel. emarg lin cinnam.-color Stipes scaly at end
15996 Cap somew. fleshy . then umbilicat. scaly or silky, Lamel somew decurr cinnam.-color Stipes fistul scurfy

15997 Cap dark-brown convex, Lamellæ light-brown, Stipes light-brown

15998 Cap somewhat membranous smooth pallid, Lamel somewhat loose saffron-color Stipes long villous white
15999 Cap obtusely conical stri when moist when dry smth ochrac Lamel adnate lin Stipes long glab fragile
16000 Minute, Cap campanulate striate when moist reddish-buff becoming pale, Lamellæ adnate rather broad distant, Stipes somewhat crooked filiform
16001 Cap somewhat conical when dry elastic, Lamellæ few trifid, Stipes very long and slender
16002 Cap globose chesnut-color lobed and incurved at edge, Lamel trifid wavy, Stipes slender white fistulous



16003 Compact, Cap depressed ochrey-brown with a tomentose involute margin, Lamellæ mostly dichotomous, Stipes thick often excentrical

16004 Cap convex scaly cracked and irregular, Lamellæ orange-brown, Stipes stout somewhat lateral
16005 Cap conv viscid becom wrinkled dull-brown marg involute Lamel adnate yellow Stipes hard thick black
16006 Imbricated sessile tulvous, Cap fleshy obovate scaly towards the margin
16007 Cap subsessile smooth flaccid pale, Lamellæ watery cinnamon-colored
16008 Cap reniform villous pale tan-color, Lamellæ rounded ferruginous, Stipes lateral tapering upwards white

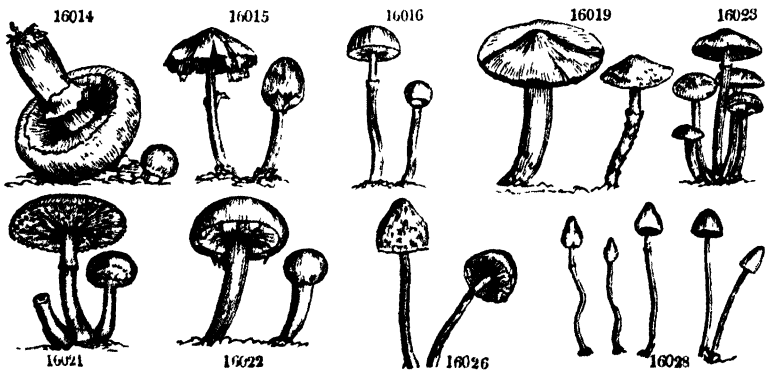
16009 Cap membranous reflexed silky downy white, Lamellæ whitish

16010 Cap silky white, Lamellæ flesh-colored, Stipes solid tapering incurved, Volva lax
16011 Cap campanulate with scattered scales, Stipes hollow ventricose smooth below

16012 White, Cap dry smoothish, Lamellæ loose broadest in front, Stipes hollow smooth, Annulus ascending
16013 Cap white fleshy dry subsquamose or sericeous, Lamellæ free ventricose pink changing to dark-fuscous Stipes solid white with an annular veil

and Miscellaneous Particulars.

§ 27 *Galera* From *galea*, a helmet, in reference to the figure of their pileus. The species are slender, fragile, tolerably permanent, mostly growing on the ground, and for the most part choosing humid stations. They have neither smell nor use



§ 28 *Tapinea* Fungi of various natures, deriving their name from ταπεινος, to depress. Mostly terrestrial and permanent, but scarcely fit for food.

§ 29 *Crepidotus* These plants form a transition to Pratella. They grow on wood or trees, and are hardly eatable A. olearius, a species which grows upon olives in the south of Europe, a poisonous species, exhibits a phosphoric appearance in the night. A translucens, a French species, is eaten by the poor of Montpellier

§ 30 *Volvaria.* So called from the magnitude of their *volva.* The species grow in fertile manured spots, or on wood, are soft and soon perishable The larger are fit for food

§ 31 *Psalliota* Mostly eatable Named from ψαλλιον, a chain-but, in the same sense as Armillaria. To this place belongs the common Mushroom, A. campestris, so called from *Mouceron*, the French name of another eatable kind. It is found all over Europe, the north of Asia, and of Africa, and in North America.

History, Use, Propagation, Culture,

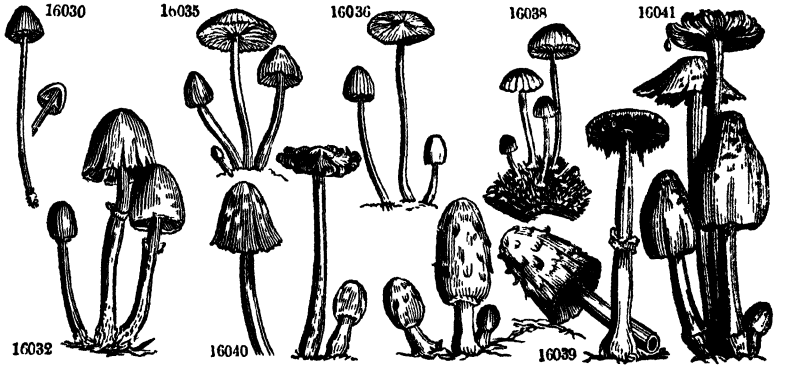
Of all the species of agaric, one only has been selected for cultivation in our gardens, viz. the A. campestris, or common mushroon, or champignon The gills of this species are loose, pinky red, changing to a liver-color, in contact with the stem, but not united to it, very thick set, irregularly disposed, some forked next the stem, some next the edge of the pileus, some at both ends, and in that case generally excluding the intermediate smaller gills. The pileus is white, changing to brown when old, and becoming scurfy, regularly convex, fleshy, flatter with age, from two to four inches, and sometimes nine inches in diameter, and liquefying in decay, the flesh white The stem is solid, white, cylindrical, from two to three inches high, half an inch in diameter, the curtain white and delicate. When this mushroom first makes its appearance, it is smooth and almost globular, and in this state it is called a button. This species is esteemed the best and most savoury of the genus, and is much in request for the table in England It is eaten fresh, either stewed or boiled, and preserved either as a pickle, or in powder, and it furnishes the sauce called ketchup The field plants are better for eating than those raised on artificial beds, their flesh being more tender; and those who are accustomed to them can distinguish them by their smell But the cultivated ones are more sightly, may be more easily collected in the proper state for eating, and are firmer and better for pickling The wild mushrooms are found in parks and other pastures, where the turf has not been ploughed up for many years, and the best time for gathering them is August and September Dr Withering mentions four varieties.

The A Georgii of Linnæus resembles the former, but is much inferior to it in flavor. Its gills are yellowish white, the pileus yellow, convex, hollow in the centre, the stem yellow, thickish, and smooth, the juice yellow, which flows plentifully from it when wounded It is gathered in September in woods and pastures A variety of this is found on the sea-coast of Cornwall, of a large size, with the button as big as a potatoe;

16014 Cap very fleshy convex white or pale-yellowish mostly smooth, Lamellæ broad whitish at length deep purple-brown, Stipes thick with a persistent collar
16015 Cap fleshy smooth yellowish tan-color, Lamellæ annexed with a decurrent tooth pale-brown, Stipes nearly solid smooth white

16016 Cap hemispher. smooth glutin redd.-yell. Lamel. adnate mostly horizont. darkly mott. Stipes holl squam.
16017 Cap somewhat viscid yellow scales scattered concentrical, Lamellæ adnate blackish, Stipes solid
16018 Cap scaly greenish-brown, Lamellæ decurrent becoming rufous-brown, Stipes solid bulbous squamose
16019 Cap fleshy yell. but being cover with a blue slime appear green Lamel. adnate purple-brown, Stipes holl.
16020 Stipes solid white, Annulus persistent, Cap yellow-brown, Lamellæ adnate reddish-grey

16021 Cap fleshy very fibrous pale yellow-brown, Lamellæ dull reddish-brown exuding a thin grey fluid, Stipes hollow fibrillose thickest at the base
16022 Cap fleshy obt brown-orange, Lamel. slightly green Stipes filled with a spongy mass stained by the veil
16023 Cap somew fleshy umbon ochrace. or redd.-orange, Lamel green numer. Stipes holl rather long slender



16024 Cap convex viscid, Lamellæ adnate whitish-brown, Stipes long fibrous
16025 Cap obtuse smooth viscid livid-yellow, Lamellæ broad decurrent brown, Stipes long naked

16026 Cap convex smooth shining, Lamellæ broad adnate blackish, Stipes long naked
16027 Cap light-brown semiglobular, Lamellæ purplish-brown broad th[illegible], Stipes reddish-brown
16028 Cap conical dry, Lamellæ adnate ascending dark-purple, Stipes tough smooth pale

16029 Cap somew fleshy smooth fuscous-brown pallid, Lamel adnate numer brown flesh-color Stipes smooth
16030 Cap somewhat membranous campanulate obtuse, Lamellæ very broad at back adnate cinereous-blackish . margin pink, Stipes thin smooth
16031 Cap cinnamon-color conical, Lamellæ dusky-brown, Stipes brownish cylindrical smooth

16032 Cap somewhat fleshy obtusely campanulate glutinous yellowish or brownish-white, Lamellæ adnate greyish-black, Stipes long white, Veil annular entire
16033 Cap somewhat fleshy campanulate humid cinereous pallid, Lamellæ adnate cinereous-black whole-colored at edge, Stipes long rufous, Annulus rugged
16034 Cap somewhat fleshy campanulate dry blackish soot-colored pallid, Lamellæ adnate cinereous-dark white at edge, Stipes long rufous striated at end
16035 Cap convex somewhat umbonate viscid yellow, Lamellæ annexed pallid, Stipes attenuated smooth yellow
16036 Cap membranaceous plicate viscous yellow, Lamellæ scarcely attached to the stipes pale purplish at length brown flesh-color, Stipes equal shining
16037 Cap hemispherical smoothish whitish, Lamellæ loose blackish-purple, Stipes naked white
16038 Gregarious small, Cap ovato-campan plicate, Lamel subadnate whit. at length grey, Stipes incurv glab

16039 Cap somewhat fleshy white scaly, Lamellæ white changing to red-purple and to black, Stipes subbulbous, Veil annular moveable
16040 Cap membranous white separating into broad scales, Lamellæ blackish, Stipes bulbous naked
16041 Tufted, Cap somewhat fleshy grey becoming reddish-brown smooth scaly at the apex, Lamel ventricose white changing to purplish-brown, Stipes equal naked

and Miscellaneous Particulars.

the expanded pileus eighteen inches over, the stem as thick as a man's wrist, the gills very pale, the curtain tough, and thick as leather, and the juice yellowish A plant of this kind, as Dr. Withering informs us, was gathered on an old hot-bed in a garden in Birmingham, which weighed fourteen pounds.

Greville says, "A Georgii derives its name, according to Parkinson, from springing up about the time of St George's day It is unquestionably the largest of the British agarics. It has been known to weigh fourteen pounds Mr Hopkirk mentions one that weighed five pounds six ounces, and measured forty-three inches in circumference; but Mr. Stackhouse found it to attain the enormous size of eighteen inches in diameter, which is fifty-four in circumference, having a stem as thick as a man's wrist. The best distinguishing marks are, the extreme paleness of the lamellæ at the *period of the bursting of the veil*, compared with the true mushroom, the greater convexity and thickness of flesh at the same period; and shortly afterwards, the more yellowish and tough pileus"

§ 32 *Hypholoma.* So called, from ὑφας, a cup, and λωμα, an edge Wood species growing in patches.

§ 33. *Psilocybe.* From ψιλος, thin, and κυβη, a head A very natural assemblage. The species are for the most part terrestrial, inhabiting fertile and somewhat fenny places, growing either solitary or in groups, not eatable, and subject to much variety of appearance.

§ 34 *Psathyra.* So called, from ψαθυρος, fragile, on account of their remarkable brittleness. Many species are found upon moist wood, and in grassy places on a fertile soil.

§ 35 *Coprinarius.* All the species are found on dung, whence their name, from κοπρια, dung.

236b *Coprinus* Named for the same reason as the last The species are gregarious and fugacious. They are found on dunghills, rich grassy places, and in the hollow trunks of decayed trees. The taste of the

History, Use, Propagation, Culture,

European species is watery and nauseous, they are therefore not eatable But in the spice islands, two species, C moschocarvanus, which is found on the nutmegs, and C saguarius, which inhabits the pith of the Sago palm, are said to be most delicious. C cinereus is extremely rapid in its growth, attaining perfection and dissolving in the course of a few hours At its first appearance, it is covered with the delicate frosted remains of the veil

2367. *Gomphus.* So named from their form, from γομφος, a club Large Fungi, scarcely fit for food, with little taste or smell

2368 *Cantharellus.* An alteration of the French *Chantarelle* C cibarius is one of the best of our eatable mushrooms The best way of preserving the plants for use is to string them in rows, after they have become flaccid, and to hang them in a dry place where they can have plenty of air They then form a delicious ingredient in rich gravies, &c.

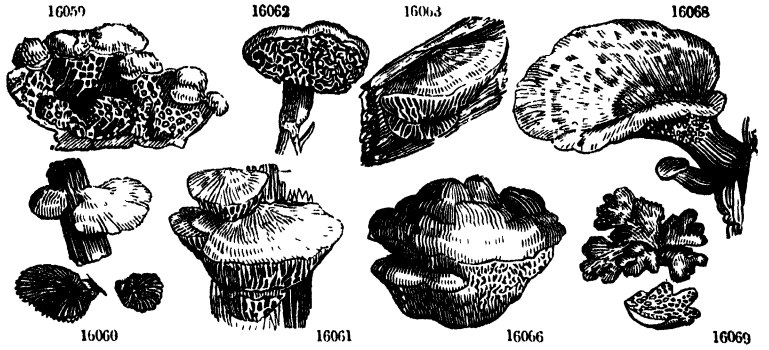
2369 *Merulius* A name applied by the ancients to the common morel, Morchella esculenta Natives of rotten wood, which they soften and finally destroy M lacrymans, the dry rot, is a pest to the wood of dwelling houses, which it speedily destroys It is said to be destroyed by a wash of diluted sulphuric acid. The whole plant is generally resupinate, soft, tender, at first very light, cottony and white When the veins appear, they are of a fine yellow, orange, or reddish-brown, forming irregular plicæ, most frequently so arranged as to have the appearance of pores, but never any thing like tubes. Sometimes the pileus or substance of the plant, from its situation, produces pendent processes like inverted cones "The whole fructification often forms a circle of 1—8 inches in diameter." Except in favorable situations, it does not produce fructification, and resembles a dry pithy cottony substance, whence it has been called the dry rot. When in a perfect state, its sinuses contain drops of clear water, which have given rise to the specific name

2370. *Schizophyllum* From σχιζω, to cut, and φυλλον, a leaf, in allusion to its lacerated appearance. Found

16042 Tuft Cap membranae furrow. furfurac. brown-orange, Lamel pale chang to black, Stipes equal fragile
16043 Cap campan farin with min scales, Stipes snow-white tomentose, Lamel narrow at length brown -black
16044 Cap furrowed subtomentose cinereous smooth on the summit, Lamel lin Stipes tall attenuated upwards
16045 Cap obtuse scaly scurfy wavy-furrowed sooty, Lamellæ numerous linear blackish, Stipes somewhat silky
16046 Very tender, Cap conical at length plane umbilicated plicate, Lamellæ not reaching to the stipes distant dark-grey, Stipes smooth weak
16047 Ovato-campanulate scaly while young afterwards glabrous becoming expanded and revolute grey or tinged with brown very thin splitting, Lamellæ distant
16048 Very delicate and fugacious, Cap grey furfuraceous at length splitting in a radiated manner glabrous brownish in the centre, Stipes filiform

16049 Cap obtuse glutinous purplish-brown, Lamellæ whitish cinereous
16050 Cap umbonate somewhat viscid rufous-brown, Lamellæ purple umber-colored

16051 Cap slightly fleshy umbonate cinereous-blackish, Stipes solid paler, Plaits straight white
16052 Cap fleshy rather depressed downy and solid, Stipes orange-yellow, Plaits straight orange-colored
16053 Rich buff yellow, Cap fleshy irregular smooth veins tumid, Stipes solid attenuated at the base
16054 Cap funnel-shaped pervious scaly and hollow, Stipes blackish, Plaits distant cinereous
16055 Cap tubeform pervious scaly black umber-color wrinkles obsolete



16056 Cap coriaceous membranous depressed wavy pallid rugose beneath, Stipes solid
16057 Horizontal sessile lobed membranaceous dilute brown, Veins branched
16058 Cap submembranac funnel-shap waved yellowish or olivac brown, Veins anastomosing, Stipes holl yell

16059 Effused large yellow ferruginous or deep orange margin white and cottony, Veins large forming irregular pores by their sinuosity

16060 The only species

16061 Sessile pale with a woody aspect, Cap suberose rugose glab Hymenium contorted sinuose anastomosing
16062 Cap somewhat corky depressed rather velvety subterruginous, Hymenium composed of labyrinth-like pores grey flesh-color, Stipes irregular central or nearly lateral
16063 Sessile pallid, Cap coriaceous banded downy, Lamellæ straight somewhat branched
16064 Sessile, Cap corky-coriaceous banded rough brownish, Recesses labyrinth-like cinereous
16065 Sessile cinereous, Cap coriaceous villous banded, Recesses unequal somewhat flexuose becoming ragged
16066 Sessile whitish, Cap corky villous projecting and gibbous at base, Pores linear straightish
16067 Sessile, Cap corky downy banded brownish-cinereous, Pores long narrow olive-yellow

16068 Large, Cap fleshy pale dirty-yellowish with broad dark-colored scales, Pores large angular whitish becoming mere reticulations at the base, Stipes very short
16069 Sessile orange-colored, Cap imbricated lobed villous, Pores large deformed

and Miscellaneous Particulars.

upon the trunks of leafy trees through all Europe and Asia, the Gold Coast, Cape of Good Hope, North America, the Antilles, and South America.

2371 *Dædalea.* So called from its sinuosities, which appear as if arranged with *Dædalean* art. Most of the species grow upon wood The dried substance of D quercina is a good styptic D suaveolens has, according to Bolton, a smell like aniseed; and Linnæus mentions, that the Laplanders carry it about them when they visit their mistresses, in order to render themselves more agreeable. From the powder of the plant is prepared an electuary which is said to have been used with success in cases of phthisis. The dose from a scruple to a drachm

2372 *Polyporus.* From πολυς, many, and πορος, a pore, on account of the multitude of pores which constitute its hymenium P squamosus is a common species on trunks of willows, oaks, walnuts, &c From this was extracted, by Braconnot, the Fungic acid. It is colorless, does not crystallize, has a very sour taste, and when evaporated to dryness, deliquesces upon exposure to the air The fungates of potash and soda do not crystallize, are very soluble in water, but not in alcohol The fungate of ammonia crystallizes in regular six-sided prisms. The fungate of lime is not altered by exposure to the air, and is soluble in about eighteen times its weight of water at seventy-three degrees.

P Tuberaster, a species common in Italy, in various parts of the kingdom of Naples, and the Pontifical states, is held in the highest esteem as an article of Neapolitan cookery P annosus, a Swedish species, is used by the peasantry as a cure for the bite of snakes Fries says, that he saw the blood which was flowing from the mouth of a kid which had been hurt stopped in a short space of time by its application From P. dryadeus, the Boletus pseudo-igniarius of Bulliard, Braconnot obtained his Boletic acid The color of this principle is white, it is not altered by exposure to the air, and its crystals are regular four-sided prisms. Its

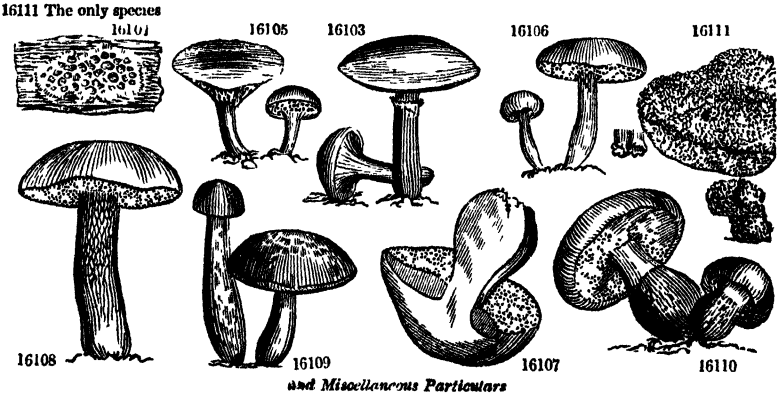
History, Use, Propagation, Culture,

taste is similar to that of tartar It is soluble in 180 times its weight of water, at a temperature of sixty-eight degrees, and in forty-five times its weight of alcohol. The aqueous solution reddens vegetable blues. It combines with the different bases forming boletates, which have been but little examined. The boletate of ammonia crystallizes in flat four-sided prisms, and is soluble in twenty-six times its weight of water at sixty-eight degrees. The boletate of potash is very soluble in water, and crystallizes with difficulty The boletate of lime crystallizes in flat four-sided prisms, and is soluble in about 110 times its weight of water at seventy-two and a half degrees. Polyporus fomentarius is much used on the continent for making Amadou; also very generally in the Highlands of Scotland for the same purpose by the shepherds, who manufacture it for themselves.

16070 Cap fleshy coriaceous thin smooth brownish, Pores very small roundish white, Stipes short pallid
16071 Cap soft fleshy somewhat umbilicated villous sooty pallid, Pores somewhat angular white, Stipes pallid
16072 Cap coriaceous velvety zoned, Pores minute at length lacerated, Plant cinnam -col. Stipes central
16073 An obscure species scarcely known
16074 Cap concave rich brown scaly, Pores white very short, Stipes whitish thick short
16075 Cap rigid glab smooth, Pores minute round pallid, Stipes short smooth pallid abruptly black downwards
β Cap rigid glab. smooth, Pores small round. pale, Stipes short smooth pale becom suddenly black at base

γ Cap yellow ochre-color or whitish
16076 Cap corky and stipes smooth shining, Pores minute round pale
16077 Much branched, Caps halved rugose sooty-grey, Pores white [Pores excessively short min round whit.
16078 Imbricated scarcely reflex whit. or brown -grey, Cap betw corky and coriac thin velvety obscure zoned,
16079 Imbricated multiplied, Caps very broad somewhat banded pale-brown, Pores unequal pale
16080 Multiplied subsessile, Caps broad imbricated smoothish reddish-yellow, Pores minute flat sulphur-colored
16081 Cap subsessile not dimidiate compact smooth pale whitish-brown, Pores white small unequal
16082 Whitish, Cap fleshy rugose hispid obtuse, Pores short roundish
16083 Cap fleshy subsericeous white changing to bluish, Pores minute white irregular lacerated
16084 Cap dumidiate large somew fleshy thick villous ferrugin Pores yellowish pale and fringed at the orifices



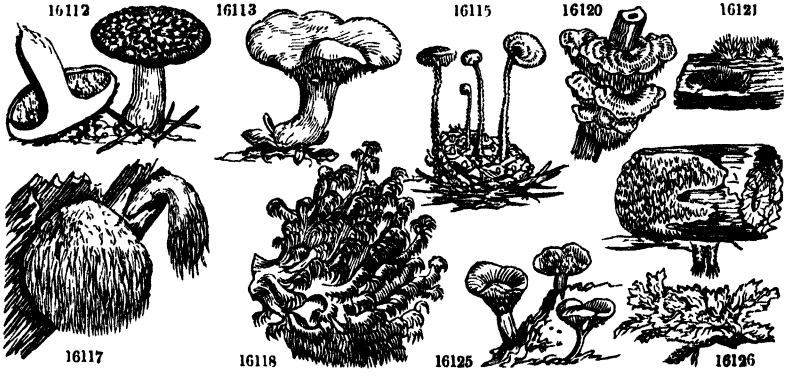
16085 Caps fleshy corky downy ferruginous, Pores shining greyish ferruginous
16086 Caps fleshy tough villous pale · margin straight blackish, Pores minute round cinereous
16087 Cap fleshy corky not banded glabrous pallid, Pores small equal
16088 Cap fleshy corky not banded villous white, Pores largish brownish [brown short irregular
β Sess. or dimid bet suber and coriac round smooth white at length brown Pores white becom yellow.-
16089 Cap mostly reflexed coriaceous villose variegated by zones of different colors, Pores round white short
16090 Caps coriaceous streaked in rays somewhat velvety brownish-yellow, Pores minute
16091 Caps coriaceous smooth not banded pale ochre-color, Pores equal [lacerating
16092 Effused but at length mostly reflex Cap thin coriac vill white, Pores violet at length brown and toothed
16093 Cap subtriangular glabrous dark brownish-grey soft within margin pale glaucous as well as the pores (which are very minute) but at length ferruginous
16094 Hard, Cap thick obtuse smoothish mostly ferruginous blackish at the base banded. margin convex, Pores minute greenish at length cinnamon-color
16095 Effused coriaceous spongy ferruginous, Pores straight round minute
16096 Effused somewhat wavy hard smooth dry white, Pores middle-size
16097 Broadly effused thin dry smooth white Pores minute subequal
16098 Effused thick portions sometimes growing out horizontally ferrugin Pores round very uneq Flesh none
16099 Effused thin soft white with a fibrous circumference, Pores thin unequal
16100 Effused coriaceous very thin submarginate, Pores orange flesh-color minute round subobblique

16101 Very fine resembling byssus fugacious white, Pores distant cupulæform powdery
16102 Effus. entirely resupin very thin white. marg membran laciniat Pores min subhexagonal very shallow

16103 Cap glutinous varying from bright-yellow to fulvous tubes adnate yellow, Stipes firm with an annular veil
16104 Cap red-buff, Pores yellow, Stipes bright-yellow, Juice like milk
16105 Cap redd. or brownish-yell smooth · tubes adnate somew decurr large ferrugin Stipes smooth deep-yell
16106 Cap round. dry subtoment. reddish or olivaceous tubes adnate large angul. yell. Stipes very firm smooth

16107 Cap convex subtomentose mostly olivaceous tubes nearly free round yellow, the orifices crimson-red, Stipes thick reticulated with crimson-red
16108 Cap convex smooth cinereous yellow or brown tubes nearly free roundish minute whitish at length yellowish, Stipes thick reticulated flesh white not changing color
16109 Cap convex glabrous tubes free round whitish, Stipes firm attenuated upwards scabrous
β Cap somewhat rufous with black scales
γ Cap slightly glutinous reddish-brown thin · tubes adnate compound yellowish, Stipes smooth
16110 Cap compact somewhat downy tubes loose round equal, Stipes solid smooth ventricose

16111 The only species



and Miscellaneous Particulars

2373. *Boletus* Pliny, Cæsalpinus, Porta, and others, call these plants Suilli The Boleti (from βωλος, a field, in allusion to the places where they are found) of the Romans were terrestrial Fungi, and more particularly Agaricus cæsareus By Tournefort these were called Phalloidei; by Micheli, Morchellæ. The species grow singly upon the ground, are succulent, and have their parts in the greatest perfection of any fungi. B. granulatus is eatable, according to Persoon, so is Boletus subtomentosus. Boletus edulis is excellent when cooked.

2374. *Fistulina.* So called from the *fistulous* nature of its tubes; the genus is just intermediate between Boletus and Hydnum, to the former of which it bears the same resemblance as Schizophyllum to Agaricus. There is only one species, and it is said, by Persoon, to be eatable.

History, Use, Propagation, Culture,

2375 *Hydnum* The Greeks had their ὑδνα and ὐδνα, tumours, which were analogous to the tubers of the Romans H coralloides is eatable; so is H leoninum, a Swedish species. A very extensive genus of fungi, chiefly found in moist situations upon the trunks of trees. The pileus is furnished on its lower surface with numerous awl-shaped bodies, which Linnæus compares to the prickles of a hedgehog; they are soft, solid, conical or cylindrical substances, emitting sporules from every part of their surface.

2376. *Sistostrema.* So named from συιστημι, *part* συιστως, compounded, and τρημα, an orifice, in allusion to the regular rows of pores Intermediate between the Agarics and Hydna. Gregarious, becoming concrete, fragile, scentless, white, becoming yellow in age. The pilei are thin, somewhat fragile, from half to one inch

1. *Stem perpendicular, Cap distinct, round, nearly entire* GROWING ON THE GROUND

16112 Cap fleshy flat tessellated scaly not banded umber-colored, Processes buffish-cinereous, Stipes short
16113 Cap fleshy smooth subrepand buffish, Subulate processes of hymenium unequal pale, Stipes unequal thick

16114 Cap fleshy orbicular somewhat tomentose brownish flesh-color, Processes nearly equal, Stipes thin equal
16115 Cap coriaceous tomentose, Stipes lateral tomentose

2. *Stem simple, somewhat horizontal, Cap halved, or out of the centre* FLESHY GROWING ON WOOD.

16116 Cap gelatinous papillose, Processes soft pyramidal glaucous, Stipes short lateral
16117 Very large heart-shaped white becoming rather yellow, Cap subsessile fibrous torn, Processes very long

3 *Cap confounded with the stem, obliterated* FLESHY GROWING ON WOOD

16118 Much branched white becoming yellow, Branches entangled tapering, Processes unilateral subulate

4 *Cap sessile, lateral* GROWING ON WOOD

16119 Cap coriaceous lobed scaly plaited rufous brown projecting behind, Processes imbricated pale rufous
16120 Effuse-reflexed, Cap coriaceous thin banded ochre-colored, Processes minute numer. ochre-flesh-colored
16121 Coriaceous woody spherical orange-color, Processes short erect

5 *Cap resupinate, effuse* GROWING ON WOOD

16122 Effused thin glabrous tawny-ferruginous, Processes in the middle straight
16123 Effused downy pale-white, Processes rounded pubescent at the end bearded with orange
16124 Effus white at length yellow with a byssoid marg Proc s of hymen. oblique subent. compr. vill at apex

16125 The only species

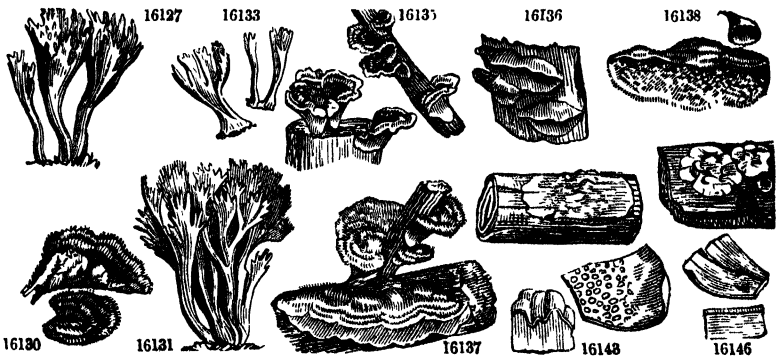
16126 Effused soft sulphur colored the circumference expanded and byssoid, Plaits distant irregular

1 *Cap entire, with a stem* TERRESTRIAL.

16127 Corky pale, Cap depressed scaly beneath smooth somewhat pilose
16128 Somew. tuft. stipit or sess. Cap irregul rarely quite ent striato-fibr purplish-brown · marg often laciniate

2 *Cap lateral, somewhat stipitate* TERRESTRIAL

16129 Irregularly tufted dark fuscous, Cap rather thick striato-fibrous sessile often imbricated sometimes with a very short lateral stipes
16130 Ferruginous brown, Caps fibrous scaly ragged and crisp at their edges



3 *Cap and stem confounded, running into compressed branches* TERRESTRIAL *Merisma* Pers

16131 Erect purple-brown, Branches compressed palmate folded paler at the summit
β Somewhat ferruginous, Branches glabrous obtusely ragged fastigiate
16132 Subdecumbent pale greyish or yellowish, Branches effused plane expanding fimbriato-laciniate
16133 Erect distinct stipitate reddish-grey, Cap with branches of nearly equal length, Stipes bulbous at base

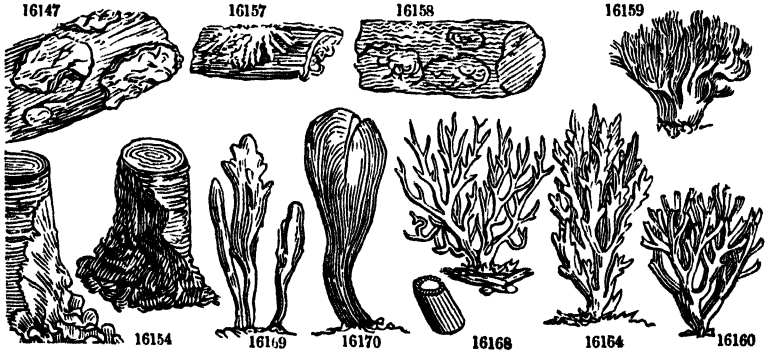
4 *Cap sessile, lateral* GROWING ON WOOD

16134 Imbricated rigid somewhat zoned purplish reddish-brown glabrous, Hymenium papillose minutely velvety rubiginous paler at the margin
16135 Effuse-reflexed thin silky ferruginous margined downy beneath

16136 Somewhat imbricated bandless smooth on each side very smooth dull-brown
16137 Effuse-reflexed coriaceous strigose, Hymenium smooth yellowish or orange-buff
16138 Effuse-reflexed somewhat membranous striated pubescent beneath smooth and ochraceous
16139 Imbricated subcoriaceous zoned hirsute, Hymenium smooth purple
16140 Imbricated velvety zoned pale reddish-buff, Hymenium smooth irregularly papillose buffish at length ferruginous sometimes shooting out into rude stems anastomosing and producing irregularly caps
16141 Round thick often conflu Marg waved splitting, Hymenium tuberculose yellow or reddish-brown crack
16142 Broadly effused thickish, The margin slightly reflexed, Hymenium ochraceous uneven unequally papillose
16143 Coriaceous broad thin, Margin free with the surface tomentose, Hymenium smooth minutely reticulated buff becoming darker in age
16144 Effus very broad thin, Hymen somew of an ochrey pale-yell smth. or with scatter uneq false papillæ
16145 Resupinate, Margin free whitish hirsute, Hymenium fuscous smooth somewhat shining and faintly zoned towards the margin cracking in a radiated manner
16146 Circular effused, Margin sometimes free rarely reflexed, Hymenium pale whitish-brown prunose silky and minutely byssoid at the margin turning red when wounded

and Miscellaneous Particulars.

broad, somewhat depressed, flexuose, and apt to grow to one another. The only species is found in August and November by the side of sandy paths in pine-groves.



2377 *Phlebia* So called, from φλεψ, a vein. As the last was intermediate between Agaricus and Hydnum, so is this between Cantharellus and Thelephora. As that differed from Dædalea, does this from Merulius. The species are all found upon bark, late in the year No species was described before the writings of Fries P. merismoides is an elegant little plant, distinguished by its reddish-flesh-colored hues. It is found occasionally spreading over wood and smooth bark, and sometimes runs with its papillose veiny branches among mosses

2378. *Thelephora* So called, from θηλη, a nipple, and φερω, to bear, in allusion to the papillose surface of

History, Use, Propagation, Culture,

of the pileus of all the species. T caryophyllæa is very common upon the exposed roots of old firs in the autumn. The substance is tough and somewhat woody, the color a chocolate brown. The plants often grow in masses, attached by their upper side to sticks, old bark, &c. and are from one to three inches in diameter.

2379. *Clavaria.* So called, from the simple clavate form of the species. Some are eatable; as for instance C. flava, which is said to be delicious, C cinerea, which is frequently eaten in France; C. pyxidata is said by Persoon to be tolerably good. Loureiro has also an eatable species found in Cochin-China, growing upon elephant's dung.

b Cap obliterated, resupinate. Growing on wood.

16147 Resupinate rigid nearly black beneath, Hymenium flesh-color rugose and papillose at length cracking
16148 Very thin effused cracking and becoming involute, very dark beneath. Hymen. brown-grey minutely farinaceous, papillate
16149 Effus. extremely thin, Marg appressed minutely villose. Hymen. purple-grey covered with small uneq papillæ
16150 Effused thin smooth, Margin delicate and byssoid, Hymenium whitish at first at length very pale-buff, Papillæ scattered or none
16151 Effused spreading over moss, &c, Margin fibrous, Hymenium very unequal tuberculose yellowish
16152 Effused unequal in thickness hard, Hymenium white glabrous cracked in different directions so as to be often tessellated obtusely papillose
16153 Effused membranaceous thin, Margin entire, Hymenium very white glabrous subpapillose

16154 Membranous smooth plaited at base whitish becoming blackish

16155 Effused membranous smooth pale beneath white with cobweb-like down
16156 Effused somewhat rugose soft of a violet-brown at the margin and beneath downy
16157 Mostly on dead leaves, Filaments very fine white radiating dilated at the extremities in a plumose manner

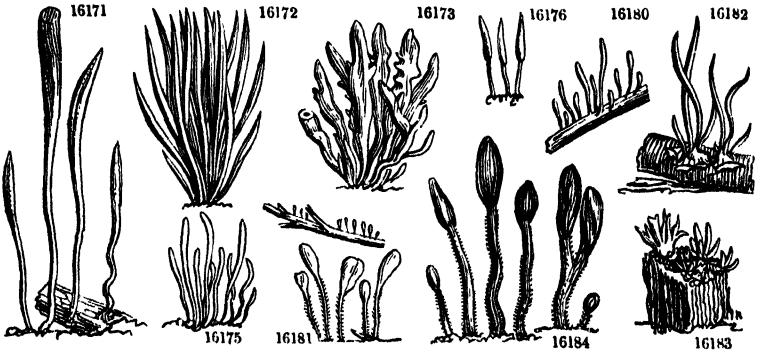
16158 Broadly effused thin dry smooth glabrous cinereous

Division II *Clavati*

* *Much branched, Stem thick*

16159 Deformed, Stipes decumbent very thick pale, Branches short somewhat wrinkled red at ends
16160 More erect, Stem thick white, Branches straight round fastigiate yellow
16161 White erect, Stipes thick, Branches elongated irregular unequal mostly acute
16162 Dull ochrey-yellow much branched white and tomentose at the base turning green when bruised, Branches erect crowded slightly rugose with acute often forked summits
16163 White or cinereous tuft branch smooth, Branch dilat at summ and jagged or shortly but acutely laciniate
16164 Grey often with a bluish or a purplish tinge much branched unequally incrassated rugose often subcompressed, Summits either very obtuse or somewhat acuminate
16165 Yellow half an inch high branched or nearly simple viscous, Stipes of several plants connected at the base

** *Branched, Stem thin*



16166 Much branched pale brownish, Branches and branchlets straight appressed acute
16167 Yell tuft Stipes short producing numerous short geniculate divaricate branches the ramuli subfastigiate obtuse
16168 Yellow erect much branched in a dichotomous manner, Branches slender with acute summits
16169 White gregarious incrassated rugose simple or branched, Branches few short obtuse

*** *Simple, clavate*

16170 Solitary large glabrous yellowish-brown thickened upwards and obtuse
16171 Very long hollow thickened upwards brownish downy at base
16172 Heaped fascicled yellow, Branches nearly equal incurved yellow
16173 Fascicled unequal subdivided hollow yellowish-brown at end [irregular at the apex
16174 Yell or yell-white tuft, or gregarious fragile unequ ventricose deformed somewhat acuminate often bifurcate and
16175 Yellow or white gregarious sometimes subcæspitose solid or hollow very brittle rather firm attenuated at the base subrugose in age and often crooked
16176 Straight white, Head distinct round acuminate as long as stipes
16177 Stem slender villous, Branches long compressed, Branchlets numerous setaceous cut
16178 Yellow gregarious cylind equal smooth obtuse slender below and paler, apex frequently of a cinnamon-color
16179 Pure white tuft, crowded subul flexuose solid but with a small perforat. mostly somewhat connected at base
16180 White gregarious round club-shaped obtuse much attenuated at the base smooth not brittle
16181 White minute, Hymenium oblong or ovato-clavate passing suddenly into a filiform pilose stipes

16182 Tough yellowish nearly simple, Stem tuberous long-rooted
16183 Tufted smaller simple and branched viscid yellow connate at base

16184 Stipes hirsute deep black, Hymenium somewhat plicate

and Miscellaneous Particulars

2380. *Calocera* From καλος, beautiful, and κερας, a horn, in allusion to the divisions of the plants. They grow on wood, and are either brown or yellow; but their sporidia are generally white. C viscosa is at once distinguishable by its beautiful gold color Some of the species adhere to paper when dry.

2381. *Geoglossum* From γη, the earth, and γλωσσα, a tongue; earth-tongue: in allusion to the simple form of the species, which all grow upon earth, and are of a blackish or dark-green color. Fries considers the genus to be scarcely distinct from Clavaria.

History, Use, Propagation, Culture,

2382 *Spatularia* A very distinct genus, named from its *spatulate* form The only species known is an autumnal epiphyte, common on fallen leaves, decaying mosses, &c Its color is at first pallid, afterwards it becomes yellow and ferruginous but the stipes retains its paler color It is found in plantations in various parts of England In a state of perfect maturity, the head, on being touched, throws up its sporules in the form of smoke, which rises with elastic force, and glitters in the sunshine like particles of silver

2383 *Mitrula* So called from its *mitrate* form The species are small epiphytes with a simple stem.

2384 *Typhula*. A diminution of *Typha*, a well-known marsh plant, the heads of fructification of which this genus resembles in miniature All the species are delicate, and are found upon decayed leaves, or even occasionally upon Sclerotias

2385 *Pistillaria* So called from its *pistil*-like form. The species are all small, delicate epiphytes, appearing in the autumn

2386. *Morchella* A name altered by Dillenius from *Morchel*, the German name of the plant Fungi of a large size, appearing in the spring upon the earth. The eatable morel is one of the most valuable of fungi for purposes of cookery, but is more frequently used in a dried state for sauces, than when fresh It is found in greatest abundance in places where trees have been burned, which led in Germany to a practice of burning down masses of forests for the sake of the future morels. This practice proved so injurious, that it became necessary to suppress it by law The morel is subject to many variations of figure and color, which are all referable to four principal forms But there are also some legitimate species which have been distinguished by modern botanists Of these it is not ascertained which are natives of England, but it is probable, that they are all to be found if sufficiently sought for Without, therefore, absolutely inserting them in the list of British species, it cannot be otherwise than useful, considering the importance of an accurate knowledge of the eatable fungi, to enumerate the two principal in this place

1. M. Deliciosa is found in the spring, among grass and bushes by the sides of fields in France, and is said to be much superior in flavor to the M esculenta Its stipes is hollow, and shorter than the pileus, scarcely ever so much as an inch long, about three or four lines thick, nearly equal in the whole length, but sometimes thickened and compressed at the base, under a lens covered with a slight downiness Pileus is conical-cylindrical, from one inch to two inches and an half long, with nearly parallel ribs, which can scarcely be said to

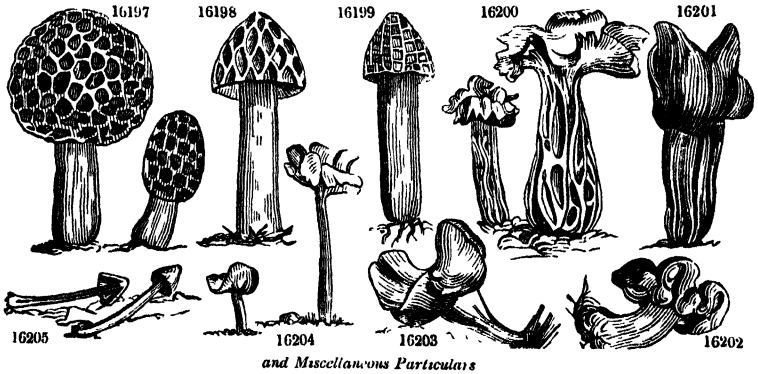
16185 Glabrous dry blackish, Stipes somewhat scaly [thin and attenuated downwards
16186 Smooth very slimy in moist weather black, Hymen. cylind. round. at apex confluent with stipes which is
16187 Green somewhat fasciculate, Hymenium distinct, Stipes minutely scaly

16188 The only species

16189 Yellow subgregarious, Cap orange-yellow obtuse hollow · margin connate with the stipes
16190 Very small, Head lanceolate yellow, Stipes equal paler
16191 Gregarious solid, Hymenium ovate yellow cinnamon, Stipes slender dark-brown flexuose at the base

16192 White filiform elongated somewhat villose at the base radicular tuber dark fuscous lenticular
16193 Gregarious min Hymenium smooth white short terminat. in an elongated filiform dark pink-red stipes
16194 Simple smooth dark thickened at end
16195 Somewhat branched spadiceous, Heads thickened whitish

16196 Thickened towards the extremity white confluent with the stipes



Class II Uterini v Elvellaceæ. — Division I *Mitrati*

16197 Cap round or oval · margin contract. round the stipes, Areolæ much hollow Stipes white dilat tow base
α Cap and areolæ round
β Cap oval, Areolæ quadrangular
16198 Cap obtuse separate as far as the middle, Areolæ rhomboid, Stipes smooth [thick white
16199 Cap short conic spread at base, Areolæ shall partly formed by longitudin parallel ribs, Stipes long equal

* *Cap waxy, membranous, at first united, afterwards wavy in plaits*
16200 Cap irregularly deflexed free often variously lobed yellow-white, Stipes deeply sulcate and lacunose white
16201 Cap dark-livid inflated deflex and partially adnate with stipes, Stipes deeply furrow and lacunose white
16202 Cap inflated deformed wavy wrinkled in circles brown, Margin villous adhering to the smooth stipes
16203 Cap deflexed lobed adnate about cinnamon-colored, Stipes smoothish villous pale

** *Cap somewhat membranous, smooth, always separate*
16204 Cap loose smooth inflated becoming sharply lobed, Stipes long thin tapering pruinose

16205 Cap campanulate smoothish fuscous somewhat sinuated at the edge beneath and the stipes yellow

and Miscellaneous Particulars

anastomose, but which are united by transverse rugosities The color is usually yellowish, rarely of a pale livid hue.

2 M elata has a longer stipes than the last, an inch and more thick, very hollow and brittle, with irregular cavities The pileus is ovate-conical, two or three inches long, but of a far more delicate texture than any of the others The longitudinal ribs are much elevated, membranous, flaccid, with very few anastomoses, but united by transverse costæ, which give the spaces between a sort of misshapen rhomboidal figure The color is a soft brown The flavor is watery and vapid, and in decay becomes so fetid as to be unfit for food. This is found in pine-woods, especially in humid places It is a rarer kind than the last and like it, appears in the spring

M patula and semilibera are readily known from the true morels by their pileus not being attached to the stipes by the base, but altogether separate from it They are distinguished from each other by the latter having a much longer stipes, and a shorter pileus, which is more conical and acute M patula is considered by Fries to have been confounded, in Mr. Sowerby's fine work on Fungi, with Helvella esculenta

2387 *Helvella* A name employed by Cicero, as the name of a fungus The species of the modern genus are permanent, somewhat fragile fungi, with little odor or taste, but always innocuous They grow on the earth or upon very wet wood, and are chiefly found in the autumn H crispa is excellent as an article of cookery. H lacunosa, which is confounded with it, is by no means so good H esculenta has a good flavor, and is commonly eaten, but is far inferior to Morchella esculenta Its qualities are nearly the same as those of the latter plant, and it is popularly confounded with it under the name, in Sweden, of *Stenmurkla*, and in Germany, of *Gemeine Morchel*, *Stumpf Morchel*, and *Stockmorchel* H infula, a large species, with an inflated smooth pileus of various hues of brown, is also esculent This last plant is the true H Mitra of Ruppius, and old botanists, a name which, having been applied by one writer or other to every species of Helvella, is now abandoned altogether in order to avoid further confusion

2388 *Verpa* An old Roman name synonymous with Phallus, and restored to modern science by Swartz The species are meteoric, terrestrial, and intermediate between the Morels and Leotia. The hymenium is covered, as is the case with many Mitrati, with a frost-like flocculence, which Swartz mistook for sporules, but which more recent observation has shewn to have been a mistake.

History, Use, Propagation, Culture,

2389. *Leotia.* Named by Sir John Hill, of famous memory, for no known reason Gregarious terrestrial substances of the middle size, appearing in summer or autumn, without smell or taste. They are most nearly akin to Helvella and Verpa, from which they differ in form and substance The species are not known to be eatable, with the exception of L. amara, a native of Cochin-China, which is capable of being deprived of its native bitterness by long stewing.

16206 Cap depressed cinereous livid smooth on each side, Stipes solid smooth
16207 Dwarfs, Cap rugose white beneath smooth brown, Stipes solid cylindrical white
16208 Tremellose, Cap tumid spread. olivac : margin rounded, Stipes orange-cylindr. or unequally compressed

Division II. *Cupulati.*

1. *Cupule always open, or when young connving, Vesl superficial, Sporidia with two smaller sporidia.*
HELVELLOIDEÆ

16209 Cyathiform sooty veiny on the outside arising from a short fistulous pitted stipes
16210 Subsess ent. flexuose brown, Margin at first involute externally pruinose paler and somew. olive-colored
16211 Substipitate lengthened on one side ear-shaped somew ferrugin mealy outside smooth inside at the base
16212 Substipitate lengthened on one side ear-shaped farinaceous outside pink inside becoming rugose at base
16213 Gregarious flexuose very brittle white externally, Hymenium fine orange
16214 Cæspitose large very brittle externally lemon colored becoming wrinkled pale flesh-color inside
16215 Gregarious cæspitose variously contorted externally yellowish-brown, Hymenium dull reddish-brown
16216 Large funnel-shaped repand yellowish villous and whitish outside and upon the stipes-like base [base
16217 Gregar cæspit glob at first with mouth conniv at length campan. splitt. externally whit and toment at
16218 Sessile solitary or somewhat tufted large at first hemispherical and concave at length nearly plane subrugose and brown within the outer surface farinose whitish, Margin crenate

2 *Cupule at first closed, Vesl innate, Sporidia simple* GEOPYXIS.

16219 Subgregarious large. the pileus hemispherical slightly hairy and verrucose ash-colored, the hymenium mouse-colored at length pale, Stipes very long incrassated below
16220 Thin, Cupule funnel-shaped brownish pallid, Stipes long seated on a black deformed root
16221 Subsessile thin globose campanulate brownish or pale mealy outside crenate at edge
16222 Sessile yellowish smooth at first urceolate afterwards cracked and torn with hairs about the root outside
16223 Sessile minute flattish orange-red externally granulated with pimples [Stipes usually short and thick
16224 Centre plicate and reticulat without whit. and prum. Cap invol. at margin variously split somew spread.

3. *Cupule a little fleshy, small, Vesl floccose only at the edge, or fugacious, Sporidia with a solitary little sporidium* HUMARIA

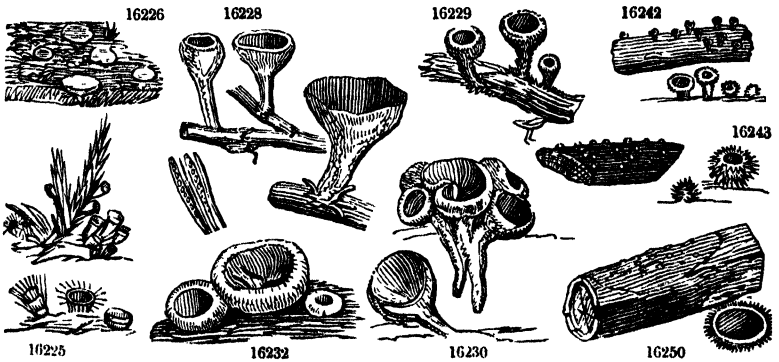
16225 Sessile clustered subcylindrical smooth somewhat yellow becoming dilated with an erect subciliated orifice
16226 Sessile fleshy plano-convex smooth crimson entire at margin

4. *Membranaceous, bursting forth with a separating veil, Sporidia simple* ENCŒLIA

16227 Subcæspitate sessile coriac membran Margin split ragged externally scurfy and brown, internally white

1 *Cupule fleshy, or fleshy-membranous Crust none* SARCOSCYPHE

16228 Stipitate large subinfundibuliform externally white and tomentose, Hymenium crimson-red



16229 Cupule fleshy, Disk urceolate black externally rubiginous-flocculent, Stipes short down dense dark strigose
16230 Subcæspit fleshy sess from hemispher becom flatten. Disk sulph external and thick root white and vill
16231 Sessile hemispherical wavy brownish externally covered by dense fascicled hairs, Disk glaucous white
16232 Sessile subhemispher externally fuscous hairy with a somewhat inflexed margin, Vermilion colored inside
16233 Min sess. or subsessile hemispher externally tomentose-pulverulent yellowish-olive, Hymen dull ochrac.
16234 Sessile gregarious or scattered nearly plane external surface of the margin hispid with black rigid hairs, Hymenium orange-red
16235 Sessile gregarious very minute orbicular somewhat depressed substrigose brown or nearly black
16236 Plane ciliated blackish externally, Hairs pale, Disk blue [at margin, Hymenium gently umbonate
16237 Small sess gregar whole plant white glob concave at length quite plane ciliate with horizont. white hairs
16238 Gregarious concave tawny externally surrounded near the edge with straightish brown hairs [white
16239 Sess gregar glob at length quite plane, exter surface and marg strig with redd.-brown hairs, Hymen
16240 Sessile gregarious small globose at length plane the strigose external surface yellow, Hymenium white

2 *Cupule waxy, dry, villous, Crust none* Epiphytes DASYSCYPHE

16241 Stipitate gregarious small, Stipes rather long, Pileus hemispherical subpatulose villous, whole plant white
16242 Subsess small gregar externally very white vill Mouth contract Hymen. varying from dil yell to orange
16243 Sessile hemispherical orbicular rather firm flocculent, Disk urceolate whitish
16244 Sessile distinct concave villous hairy milk-white on each side granulated at edge
16245 Sessile very minute gregarious white subglobose villous, Mouth more or less connivent
16246 Sessile minute gregarious depressed externally fusco-olivaceous villose, Hymenium smooth bluish-grey

3 *Cupule waxy or coriaceous, seated on a downy crust* TAPESIA

16247 Substipitate much crowded form a crust, Cupules turbinate vill light bistre-colored disk urceol whitish
16248 Sessile gregarious obovate strigose rufous
16249 Sessile gregarious ovate globose golden-yellow strigose with a subjacent woolly paler web
16250 Carn. sess Cup. concave brown at length plane grey marg glab attach by fibres to a wide toment wel

and Miscellaneous Particulars.

2390. *Peziza.* Pliny had a tribe of Fungi which he called Pezica, from which the modern name has been corrupted. The present genus is very extensive, but almost wholly of modern creation The species are found in various situations, but chiefly on decayed wood. They are remarkable for their leathery texture, and for emitting their sporules in the form of smoke from the bottom of their cup.

History, Use, Propagation, Culture,

2391. *Ascobolus* From *ascus*, one of the forms of theca in which the sporules are retained among Fungi, and *βαλλω*, to emit, in allusion to the principal peculiarity of the genus Small gregarious soft plants, without roots, but not very perishable, growing upon dung, and most obvious during rainy weather

2392. *Bulgaria* An intermediate genus between Peziza and Exidia, named from *bulga*, a leather bag, on account of the saccate form of the species Scentless, insipid, mucilaginous, rootless, soft fungi, tolerably permanent, and generally breaking forth in clusters from the bark of trees during the winter and autumn Miller is said to have succeeded in obtaining glue from B. inquinans, but subsequent attempts have failed of success.

2393 *Ditiola.* From *δις*, double, and *ωλος*, down, in allusion to the nature of the pubescence of the velum. The species of this genus are gregarious, firm, permanent, without smell, flourishing upon dry wood from the

1. *Cupule somewhat membranous, distinctly stalked, Hymenium distinct.* Hymenoscyphi.

16251 Rather large ochrey-brown infundibulif. at length concavo-rep. or very plane, Stipes elongat. dark at base
16252 Cap smooth urceolate orange-color with a prominent membranous pale margin, Stipes cylindrical pink
16253 Gregar yell or redd.-white subinfundibulif surface of hymen plane, Stipes long subflexu and attenuat.
16254 Bright-yellow, Cupule plano-convex thinnish, Stipes short firm thickish
16255 Stipit glab white or yellow subinfundibulif Margin fringed with inflexed teeth, Stipes elongated curved
16256 Stipitate campanulate, Margin smooth, Stipes straight

2. *Cupule fleshy, waxy, firm, obconical, somewhat stalked, Hymenium distinct.* Calycinæ.

16257 Yellow, Cupule turbinate, disk flat, margin tumid, Stipes long slender
16258 Gregarious globoso-infundibulif slightly concave, Stipes rather short attenuat. whole plant ferrugin. [orange brown
16259 Æruginose, Cupule turbinate becoming expanded and flexuose. disk whitish, Stipes short

16260 Cupule subrepand smooth disk yellow exteriorly white as well as the somewhat ascending stipes
16261 Yell. crowd apparently sess. but having a short thick obconical stipes carnose, Hymenium plano-concave

16262 Crowded smooth pale-yellow or whitish, Cupule concave, Stipes short thickish pallid
16263 Hemispherical margined, Disk yellowish externally sooty, Stipes very short whitish
16264 Gregarious white rather small very membranaceous campanulate unequal, Stipes filiform short
16265 Black solitary rather large very concave, Hymen cribriform or full of lacerat. irregular pores or sinuses
16266 Yellow gregarious minute obconical at length somew plane, Margin raised obt. externally somew paler
16267 Yellow very minute gregarious punctiform globular at length plane or subconvex, Margin minutely cren
16268 White gregar carnose at length convex but sometimes depress in centre turning reddish in age and decay

3. *Cupule waxy, soft, watery, sessile or obconical, Hymenium confluent.* Mollisia.

16269 White gregarious excessively minute orbicular submarginate
16270 Fulvous orange gregarious crowded minute nearly plane subtremella-like
16271 Grey gregarious depressed waved subtremellose, Margin obsolete
16272 Sessile somewhat tufted membranous soft smooth whole-colored all over and whitish

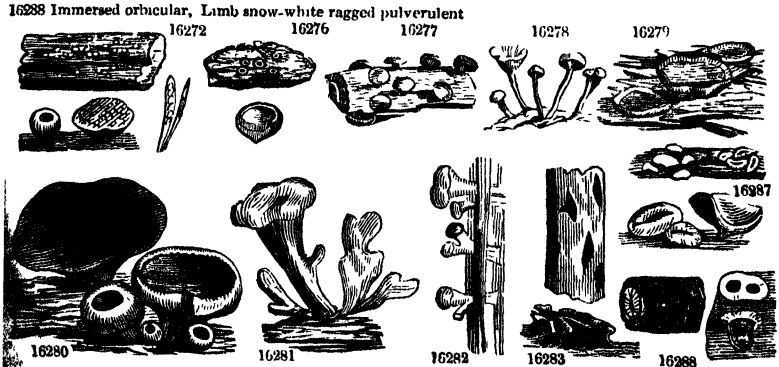
β Scattered flattish-urceolate whitish transparent
16273 Minute ceraceous glab. sess grey connate within the semiputrid petioles of the Sycamore and burst. forth [in wet weather

4. *Cupule waxy, dry, sessile, flat at base or innate edged* Patellea

16274 Ochrey-brown min gregar carnose thick obconic Hymen minutely granul at length plane or subconvex
16275 Green gregarious minute subtremellose hemispherical at length plane becoming black in decay
16276 Sessile dry patellate cæsious on the outside, Disk yellow

16277 Firm, Head convex yellow black-brown beneath, as is the short thick villous stipes
16278 White smooth, Head convex, Stipes long equal

16279 Sessile gregarious somewhat concave olive-green or brownish externally furfuraceous



16280 Turbinate firm, externally rugulose scaly umber-colored, Disk flattish blackish
16281 Polymorphous cæspitose subgelatinous somew firm purplish-red externally subvenose, Hymen concave

16282 Disk flattish golden-yellow, Stipes thick villous white long-rooted

16283 Simp gregar long flexu. at first closed prun and blackish-cinereous, afterw open with a broad pale disk

16284 Substipitate opake rigid black marginate, Hymenium concave
16285 Coriaceous reddish-black at first closed at length expanded and plane
16286 In round. tufts, Cups stipit subturbin concave with round marg intermix with digit. or subul processes
16287 Gregarious between membrane and leathery subsessile rugose somewhat prunose, The orifice compressed inflexed: when moist spreading

16288 Immersed orbicular, Limb snow-white ragged pulverulent

and Miscellaneous Particulars.

tumn until the spring They are to be considered noxious fungi from the injury they bring to the timber on which they vegetate Their mucilaginous roots insinuate themselves between the fibres of the wood, d separate and soften them. Their tuberrles burst forth, and filling the wood with clefts, and rendering its terior accessible to wet, soon destroy it. D radicata is one of the species of dry rot.

2394 *Cenangium* From κενος, hollow, and αγγιον, a capsule or vessel, in allusion to the hollow nature of he receptacle Chiefly distinguished from Peziza by substance, and the coriaceous nature of the cupules. From Tympanis it is distinguished by its closed cupules and smooth permanent hymenium The species are small and deformed, growing upon the bark of trees, either singly or in tufts, and mostly produced in winter

2395 *Stictis* So named from the punctiform appearance of many of the species, from στικτος, a dot. Very simple, minute, gregarious fungi.

History, Use, Propagation, Culture,

2396. *Cryptomyces* Upon this curious addition to the British Flora, Dr Greville has the following remarks "This very curious plant, I have little hesitation in placing as a new genus among the true Fungi It is difficult to say, with what it has nearest affinity In general habit, it might be supposed to resemble some species of Thelephora, but there the comparison stops Our plant, besides being produced under the epidermis, seems to belong to a more perfect group, when its structure is examined The hymenium is a quite distinct substance from that of the receptacle The fructification is fully and beautifully developed, a good deal similar to that of the Helvellæ The receptacle is carnose and white, and the whole exhales a very strong odor, precisely like what is universally known under the name of a fungus-like smell. Till the plant is perfected, it remains concealed beneath the epidermis, and on this account, I have named the genus Cryptomyces. The epidermis, in fact, scarcely seems to crack by the swelling of the fungus, more than by the natural consequence of being killed by its separation from the subjacent bark A cluster of willows, which was attacked in the beginning of the season by this plant, has been nearly destroyed by it, and, from the rapidity of its progress, I have no doubt that a whole plantation might, in the course of a couple of seasons, be rendered good for nothing At a little distance, the affected branches look as if they were dry, scorched, and rotten"

2397 *Tremella* Large or middle-sized fungi, rooting at the base, which is considerably contracted between the bark and the wood of trees. Dillenius named the genus on account of its soft, tenacious, tremulous substance, but his name was applied in a far more extensive sense than at present. The section called Phyllopta is an aberrant form of the genus, and should perhaps be separated

2398. *Exidia.* From ἐξυμι, to proceed from a thing; with reference to the manner in which the sporidia exude as it were from their receptacle This genus differs from Tremella, to which it is nearest, in its horizontal Peziza like receptacle, in its hymenium being superior, the lower surface being dissimilar and either

16289 Suborbicular olivaceous at length nearly black white within, Thecæ elongated obtuse

Class III. Tremellini.

16290 Sessile roundish orange-yellow variously lobed and plicate
16291 Sessile roundish or spreading and somewhat expanded obtusely lobed and plaited whitish
16292 Sessile clustered tumid plaited shining-brown
16293 Gregarious distinct tender gelatinous simple lingulate dull-orange pulverulent towards the apex

16294 Sessile gelatinous reddish-purple at first club-shaped then rounded lobed plaited or curled finally blackish

16295 Cartilaginous lobed somewhat wrinkled black

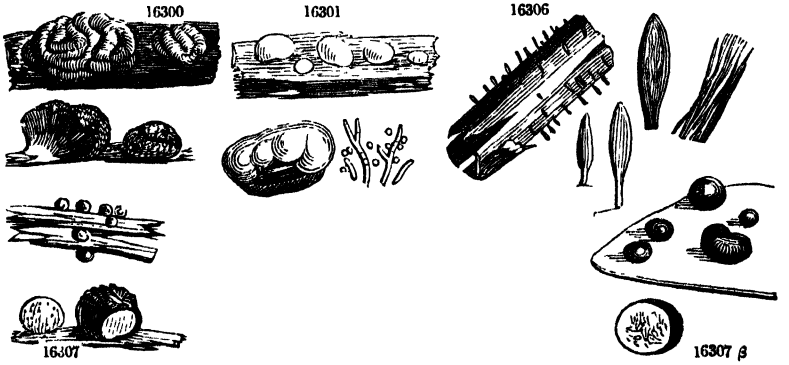
1 *Pezizoid, plicate, villous beneath, or dotted with roughness, Tubes half inferior, distinct* Auriculæ.
16296 Sessile concave flexuose blackish plaited on each side with veins beneath downy olive-grey

16297 Very soft truncate-flat subrepand fuscous beneath dotted scabrous, Stipes very short oblique out of centre
16298 Thin flaccid very dark, externally opaque, internally wrinkled

2 *Somewhat flattened, wavy, rugose beneath, Tubes half-inferior, obsolete* Glandulosæ.
16299 Sess round. rather spread thick not goyrose plicate ben. · the surface bear min white-headed processes

16300 Conglobated sinuous dark opaque fleshy and purple inside
16301 Gregarious entire round depressed pi tpy orange-yellow

16302 Gregarious nearly separate convex whitish cæsious



16303 Long various smooth whitish when dry becoming brown . the circumference adhering

16304 Subsessile pulvinate plaited-rugose pale flesh-color becoming dry

Class IV Sclerotiacei

16305 Horn-like smooth when dry furrowed rufous becoming paler at the end
16306 Stipitate mostly lanceolate somewhat obtuse subcompressed of a dark olivaceous color

16307 Separate spherical whitish-yellow becoming wrinkled and black, white inside
β Clustered somewhat immersed pale inside
16308 Deformed lobed smooth pale becoming tawny, whitish inside

and Miscellaneous Particulars

villous or rugose, and ribbed in a peculiar manner, in the conoid papillæ of the disk; in the tubes, which must be esteemed rudimentary asci, containing the sporules; and in the elastic manner in which the sporidia are produced. The species are simple, rarely growing in patches, of a large or middle size, and generally inhabiting wood, when dry they are membranous, but nearly regain their original form upon being moistened

2399 *Dacrymyces* From δακρυ, a tear, and μυκης, a fungus; in allusion to their deliquescent nature. Tremella deliquescens of Bulliard, a yellow confluent mass found chiefly upon pine-timber in the spring, is the type of the genus.

2400 *Agyrium* Apparently from αγυιεις, a crowd, in allusion to the clustered disposition of the individuals; although Fries, the author of the name, expressly declares that it has been named "ob superficiem nunquam non lævem." Small dot-like gregarious plants growing upon wood, perennial, seated upon a crust-like spot, and resembling some species of Lecidea.

2401. *Hymenella.* This genus consists of plants growing upon plants, generally upon the stem, having the habit of Sclerotium durum, but softer, more tender, and bearing sporidia within their surface, for which reason they seem as if they consisted only of a kind of elementary *hymenium*, whence their name.

2402. *Næmatelia.* From ναιμα, gelatine, and τιλεω, to enwrap, on account of the nucleus, which is of various figures, enclosed in the receptacle.

2403. *Acrospermum.* Minute fungi of a rigid habit, parasites upon decaying vegetables. From ακρος, the summit, and σπερμα, seed, on account of the apex of the plants becoming tumid, and emitting the sporules.

2404. *Sclerotium.* From σκληρος, hard, in allusion to the remarkably firm substance of the species. All the species are parasites upon other plants, and some are very destructive.

History, Use, Propagation, Culture,

2405 *Rhizoctonia* Subterraneous fungi, reposing upon the roots of living plants, which they destroy. The species appear in the summer or autumn, and are very destructive. They have received their name from their habits, ῥίζα, a root, and κτείνω, to destroy. They are very nearly related to the subterraneous Sclerotia. R. crocorum grows parasitically on the roots of the cultivated Saffron, Crocus sativus, in France, and is so pernicious as to have acquired the name of *la mort du safran.* It is very destructive, soon causing the bulb to perish, and spreading with great rapidity over a whole field of that valuable crop, if not speedily stopped by a trench fifteen to eighteen inches deep, to cut off the communication between the infected and the sound plants. The smallest quantity of earth from an infected field is said to be capable of communicating this plague, even if the ground were not planted with saffron till twenty years afterwards. "Hitherto this destructive parasite has not been heard of but in France. The plants are of an irregular knobbed figure, from half an inch to an inch long, of a light reddish brown, scarcely bursting; granular and paler within. Long branching capillary roots are sent out in all directions, propagating the plants very extensively and readily by offsets which attach themselves to the saffron, and multiplying in the substance of the bulbs soon destroy them." (*Smith.*)

2446. *Peziza.* From πέρι, about, and οὐλος, hairiness, in allusion to the appearance the species exhibit when growing upon the roots of plants, or decaying fungi.

16309 Gregarious roundish but very irregular tuberculose orange-yellow within and without or whitish
16310 Depressed epiphyllous scattered or very confluent reddish fulvous
16311 Minute on both sides of the leaf numerous dark mostly angular and subconfluent
16312 Black very minute roundish or oval numerous depressed
16313 Epiphyllous orbicul flattened at length somew concave in middle fixed ben. by a central filamentous point
16314 Minute somewhat scattered or partially aggregate very black orbicular depressed
16315 Deep-black oval or elongated cernuous at length substriate or rugose white within
16316 Roundish or oval confluent corneous externally and black paler within and concave
16317 Epiphyllous scattered globular or subdepressed smooth pale at length black, Substance very corneous
16318 Rounded or oblong sometimes confluent white at length brown or black corneous externally, within somewhat hollow and carnose

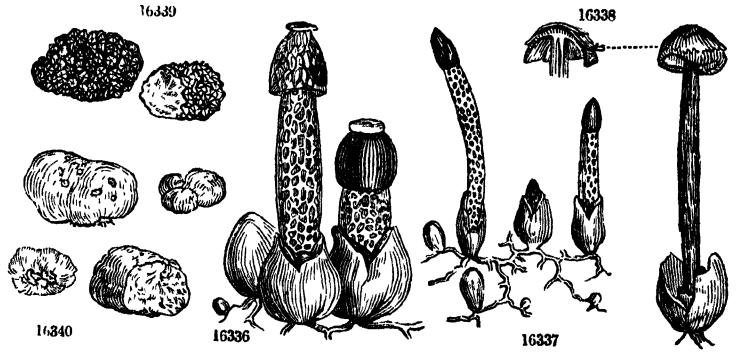
16319 Rufous, Filaments few spreading over the bulb in the form of a disk

16320 Round deformed downy white

16321 Horn-like cylindrical powdery and purple-black outside, white inside

16322 Very minute on both surfaces of the leaf, Filaments forming a dense whitish web
16323 On both sides of the leaf very globular nearly black, Filaments giving the leaf a farinose aspect
16324 On both sides of leaf form circular pulverul spots at length confluent Filam dichotom. at the extremities
16325 Red-brown minute, Filaments spreading over the whole leaf pulverulent
16326 On the under-surface scattered very visible blackish, Filaments few simple not rendering the leaf whitish
16327 On the upper-surface finely pulverulent, Receptacles minute congregated here and there
16328 On the under-surface thickly covering the whole leaf, Filam simple granuliferous · bodies pyriform small
16329 On both sides of the leaf forming a light pulverulent surface, Recept few scattered distinct
16330 On under-surface very numer min Filam few forming no filament or pulverul appear to the naked eye
16331 On both sides of the leaf so crowded as to darken its color, Filaments very long and slender
16332 On the under-surface scattered at length concave, Filaments elongated interwoven
16333 On both sides the leaf very numerous scattered minute, Filaments presenting a glaucous powdery surface
16334 On both sides the leaf scattered becoming confluent pulverulent, Recept aggregated here and there
16335 Chiefly on under-surface partially scatter Filam. long flexu Granuliferous cells oval contain mostly 4 gran.

GASTEROMYCETES.



Class I. ANGIOGASTERS — Division I. *Phalloideæ*

16336 Volva large, Stipes very cellulose white, Cells of the head containing a fetid dull-green sporuliferous slime
16337 Head close to the stipes ovate warted impervious pink

16338 Stipes cylindrical straight mucilaginous

Division II *Tuberaceæ*

16339 Very rough with warts blackish
16340 Very rough with warts whitish

and Miscellaneous Particulars

2007. *Acinula.* Very similar to Sclerotium or Perisola, but distinguished by the diffluent coat, containing a nucleus resembling an *acinus* in a berry, whence the name A Clavus is the Ergot of corn.

2408. *Erysibe* A Greek name of mildew Most of the productions arranged under this head are known by the popular name of mildew. They are better characterized by the plants on which they grow, than by their peculiar differences, which, it is probable, depend very much upon the former circumstance.

2409 *Phallus.* Large terrestrial fungi, sometimes growing upon rotten wood, not clustered, appearing in the summer after thunderstorms, fetid, and highly poisonous. Their form is so similar to that of the φαλλος of the Greeks, as not to be overlooked.

2410. *Batarrea.* So named by Persoon, in honor of Antonio Batarra, professor of botany in the Lyceum at Rimini, and author of a Historia Fungorum Agri Ariminensis, published at Faenza, in 1759, in quarto, with forty plates A very curious plant found only in England, where, however, it is exceeding rare. The volva or wrapper is about the size of a hen's egg, originally of three slightly coriaceous layers, hollow internally, when a spongy stalk is formed which rises suddenly to its full height of about twelve inches. This stalk carries up on its summit full half the innermost layer of the volva, which is white and smooth within, and covered externally with copious brown sporules intermixed with fibres.

History, Use, Propagation, Culture,

cookery Dogs are taught to find this fungus by the smell, and to scratch it up out of the earth. An instance is recorded of a man having possessed this power It is brought to table either simply boiled, or stewed in various forms. It is reported to have a stimulating aphrodisiacal quality, which perhaps renders them more popular than their flavor, which is trifling Truffles are found under the surface of the ground in various parts of Europe, where the soil is light and dry; as well as in Japan and the East Indies. There are said to be numerous varieties of color

2412. *Rhizopogon* Large or middle-sized Fungi, emerging from the earth, and resembling potatoes, scarcely eatable; but, according to Gleditsch, possessing aphrodisiacal qualities. On the outside covered with netted corymbose rooting fibres, whence the name, from ῥίζα, a root, and πωγων, a beard.

2413. *Nidularia.* A diminution of *nidus*, a nest. The plants consist of a leathery cup containing several lenticular bodies supposed to contain sporules, and all together resembling a bird's-nest with eggs.

2414. *Myriococcum* From μυριος, a thousand, and κοκκος, a little capsule Related to Sclerotium The only species consists of superficial deformed confluent tubercles, 2-4-lines broad, at first sight resembling a white compound Sphæria with prominent brown orifices.

2415. *Polyangium.* Named by Link, from πολυς, many, and αγγιον, a capsule Easily distinguished from the last by the internal grumous substance, which Nees and Fries consider unequal sporidia

2416. *Atractobolus* From ατρακτος, a spindle, and βαλλω, to cast. The bladder which contains the sporules, is fusiform and closed, and is ejected from the base of the cupule as soon as the operculum is thrown off.

2417. *Thelebolus.* From θηλη, a nipple, and βαλλω, to emit. The uterus protrudes a globose papilliform vesicle This is found on the dung of swine, after rainy weather in June and July. Tode compares it to the

16341 Round somewhat rugose whitish-brown slightly fibrous at base

DIVISION III *Nidulariaceæ*

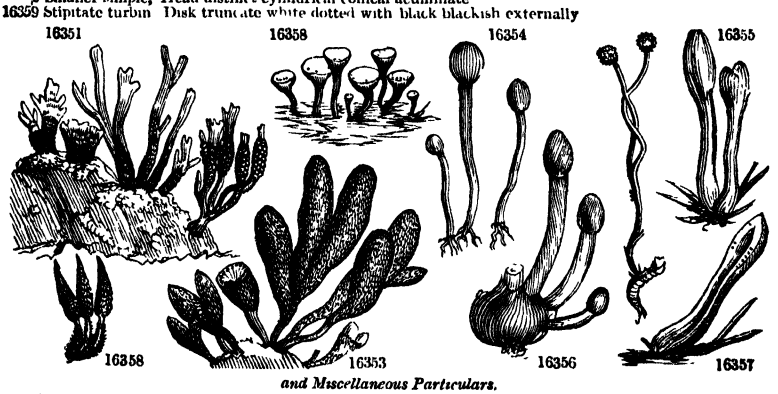
16342 Obconical hirsute bright-brown striated inside
16343 Campanulate villous cinereous-brown lead-colored and shining inside
16344 Campanulate-cylindrical truncate at each end somew. downy ochrey-brown smooth and pale-yellow inside

16345 Tubercles superficial deformed confluent, at first sight resembling some kind of compound sphœria

16346 About the size of a grain of sand

DIVISION IV *Carpoboli*

16347 Resembling to the naked eye flour scattered about



16348 Subglobose saffron-color gregarious sessile

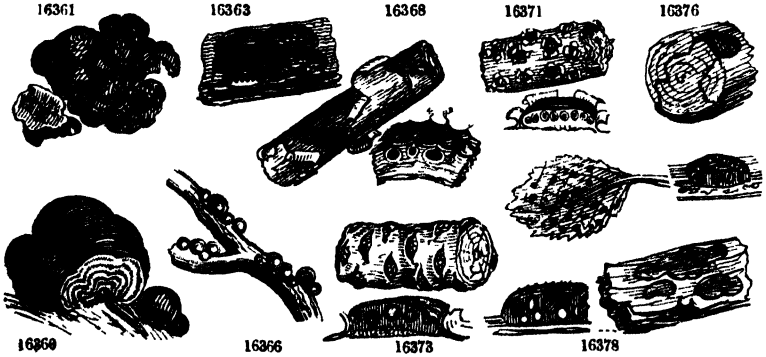
16349 Stem-like receptacle inflated upwards (rarely filiform) Pointed capitular vesicle round depressed black
β Stem-like receptacle globose, Stipes oblong filiform, Capitular vesicle dot-like black

16350 Globose pale-yellow, Orifice regular stellate toothed

CLASS II PYRENOMYCETES — DIVISION I *Sphæriacei*

16351 Gregarious branched compressed black white and farinaceous towards the apex downy at the base
16352 Gregarious somewhat tufted black, Peduncles glabrous more or less united at their base, Receptacle cylindrical terminated by a sterile acuminate apex
16353 Black gregar simp or divid Pedunc pass into a ventric recept contain spherules ben its whole surface
16354 Stipes elongat. cylindr equal somew flexuose, Recept smooth roundish-ovate brown, Spherules obl. pale
16355 Fleshy, Head globose fuscous, Stipes thin very long
16356 Fleshy, Head ovate globose brown, Stipes yellow becoming blackish
16357 Fleshy soft, Head clavate pale tan-color confluent with the stipes
16358 Corky simple and branch compressed at first whitish powdery afterwards naked and black, Stipes villous
β Smaller simple, Head distinct cylindrical conical acuminate
16359 Stipitate turbin Disk truncate white dotted with black blackish externally

and Miscellaneous Particulars.



roe of a fish in appearance, and to poppy-seed in size The color is a tawny yellow. Each individual is globular, attached at the bottom by capillary roots, and crowned by a small papillary tubercle of a more orange or golden hue than the rest

2418 *Pilobolus* Named from πῖλος, a cap, and βαλλω. A very natural genus, consisting of gregarious little fungi of a very fugacious nature, inhabiting dung, appearing in the summer and autumn, when full grown they resemble species of Mucor, but in a younger state they are more evidently interwoven, and resemble Sphæria or Sclerotium

2419 *Sphærobolus* From σφαῖρα, a globe, and βαλλω The peridium is double, membranous inside, at length becoming elastically inverted, and emitting a globose solid sporangium, filled with sporidia clustered in the centre Epiphytous persistent plants, generally appearing in the autumn S stellatus is found in various parts of Europe in autumn upon rotten wood or branches of trees, heaps of sawdust, or in the tan-pits of hothouses In an early state each plant consists of a pale yellow globe larger than a mustard seed. Several such grow crowded in patches, bound down as it were by a fine cottony web After a while each plant bursts into several starry rays, and by a momentary explosion, projects to the distance of six or eight inches a whitish globular mass of powdery seeds from its internal cavity Sometimes this ball of seeds remains sticking to the points of the rays When fallen to a distance, the skin of this ball is found empty, the seeds having flown out, in its passage, through a hole in its base. (*Smith*)

2420 *Xylaria* From ξύλον, wood, in allusion to their station, or to their woody and durable texture. Once included in Sphæria.

History, Use, Propagation, Culture,

2421. *Stromatosphæria* From στρωμα, a layer or bed, and σφαιρα, a globe, in allusion to the imbedded character of the species Apparently well divided by Dr Greville from Sphæria.

2422. *Cucurbitaria.* So named in reference to the form of the sporules, which resemble little flasks Sphæria

** Receptacle free, not bursting through bark*

16360 Large black somewhat hemispherical, Surface smooth, Orifices of the spherules scarcely at all raised within composed of regular concentric strata
16361 Large pale and carnose at length brownish-black and rigid spreading thick undulato-rugose the surface dotted with raised points
16362 Brown hemispher depress somew confluent when crowd interior of same col. Spher very slightly promin.
16363 Black thickish undulato-rugose whitish within, Mouths of the spherules round and somewhat prominent
16364 Black gregarious forming linear or oblong striæ smooth, Spherules very minute without obvious mouths
16365 Black irregular mostly free but sometimes bursting through the bark spreading confluent thickish-green within, Mouths of the spherules obtuse granulated prominent
16366 Globose purplish-red shining black within, Spherules in circumference with more or less promin. orifices

*** Receptacle bursting through bark*

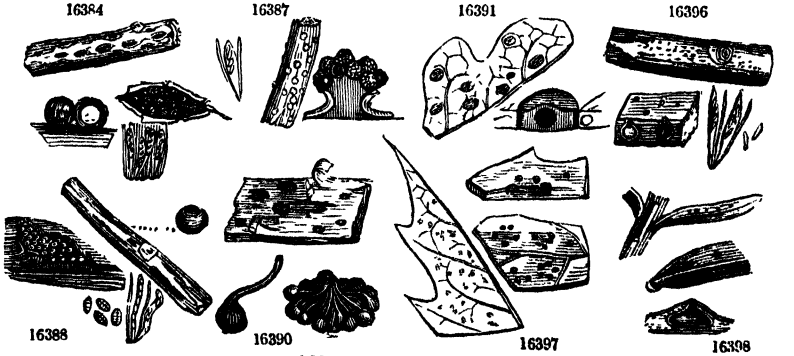
a Orifices of the spherules plane, or slightly prominent

16367 Black plane spread. transversely on branch smooth inside whitish, Mouths of spherules not prominent
16368 Black plane spreading longitudinally white within, Mouths of the spherules somewhat prominent conical
16369 Black plane widely spreading somewhat rugose at first subdistinct at length confluent and united by a kind of irregular crust, Mouths of the spherules conical and angular
16370 Grey-black scattered plano-convex round parasitic on elm leaves, Surface papill with mouths of spherules
16371 Scattered distinct very gregarious round elevated plane dark-brown dotted with the orifices of the spherules, Orifices nearly plane
16372 Scatter broadly thin, Perithecia immers scatter cover with a dark membran crust, Orifices burst forth
16373 Scattered gregarious rather large elliptical rusty-brown smooth minutely pulverulent blackish and friable within, Mouths of the spherules quite concealed
16374 Short of a determinate figure emerging dark, Perithecia somewhat ovate, Orifices obtuse-unequal
16375 Rather small roundish elliptical dull-black bursting transversely through the bark depressed rugoso-sulcate, Surface minutely rough with the mouths of the spherules
16376 Innate-immersed effused smooth black, Perithecia ovate immersed, Orifices prominent somew depressed
16377 Gregar distinct bursting through the bark which is marked with a narrow black ring, Disk small covered by an evanescent membr ben white pulverul dott with the black orifices of the immersed spherules
16378 Thickish purplish-brown black within covered with a min pulverul substance, Spher conceal. Spor. oval

b. Orifices of the spherules more or less spinous

16379 Scattered very gregarious somewhat conical roundish the disk pulverulent white, Orifices of the spherules somewhat prominent and converging
16380 Deep black bursting transversely through the bark oblong elevated, Orifices of the spherules crowded level-topped acutely 4-sided and grooved
16381 Black round much elevated very gregarious the orifices thick irregular 4-sided
16382 Black gregarious sometimes subconfluent bursting transversely through the bark ferruginous within, Orifices of spherules erect straight cylindrical spinose
16383 Receptacle very small black, Spherules few crowded with thickish cylindrical elongated obtuse coarctate orifices umbilicate at their apex and piercing the bark

16384 Black ellipt-obl burst longitudin through the bark, Spher seat on recept crowd rugose somew tessellat
16385 Clustered, Spherules globose dotted red at length black at first immersed in the receptacle, Tubes containing the sporules attenuated at each extremity
16386 Very gregarious, Spherules minute clustered scarlet oval irregular in size smooth the mouth papilliform
16387 Dull pale-red scattered or crowded on the receptacle, Spherules globose tuberculated and rugose
16388 Black, Stroma very long, Perithecia at first immersed at length sessile crowded globose, Orifice papilliform with a circular depression around it



** Spherules collected into circular clusters*

16389 Black, Spherules few the mouths elongated rough converging
16390 Black spherules aggregated forming a dense circle, Mouths filiform flexuose converging depressed
16391 Innate grow on both sides, Leaf arrayed in round spots flat black, Perith convex promin becom bossed

*** Spherules more or less scattered, or simply aggregated*

a Spherules with an orifice

16392 Spherules few aggregated globose black the orifice suberect filiform shining style-like
16393 Gregar burst forth, Perithecia globose nearly separate fine black becom ragged and cup-shap Orifice simp
16394 Black shining very numerous ovate conical the mouth short thick cylindrical piercing the epidermis like a black point, After the decay of the epidermis the sphertules are naked
16395 Scattered, Perithecia prominent convex smooth black, Orifice open white
16396 Spherules black minute very numerous globose white within immersed in the substance of the bark the mouth very short scarcely piercing the epidermis which seems covered with innumerable dots
16397 Upon leaves, Perithecia innate prominent punctiform globose black clustered in unequal spots
16398 Minute scattered, Spherules depressed the mouth very short not exserted, Epidermis of the leaf convex and slightly ruptured Sporules naked extremely minute

and Miscellaneous Particulars

Cucurbitula of Tode, seems to have afforded the type of the genus, which contains most of the species constituting the seventh section of Sphæria in Persoon's system

2423. *Cryptosphæria.* A genus formed by Dr. Greville, to include those plants formerly retered to Sphæria,

History, Use, Propagation, Culture,

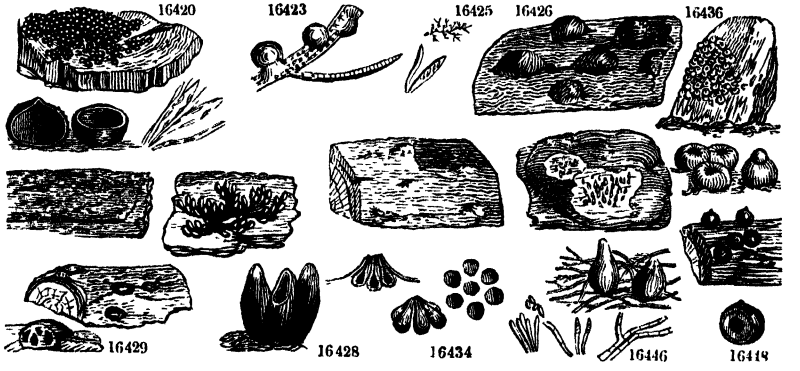
which are destitute of a receptacle and remain concealed (κευτος, hidden, whence the name) beneath the epidermis of vegetables, which is only perforated by their mouths. They are further characterized by having their spherules not enclosed in filiform tubes as in true Sphæria.

16399 Black roundish oblong scattered bursting through the epidermis, Orifice irregular papillose [minute
16400 Scatter rather min plano-convex black. splitt. Epider in centre and becom umbilicat Spor naked very
16401 Scattered, Perithecia immersed globose black concealed, Orifices dilated naked hemispherical
16402 Scattered black shining plane · the margin slightly raised, the epidermis united with the plant and bursting at the centre into 3-5 acute segments, Sporules naked oblong in 3-5 distinct masses
16403 Gregarious often crowded, Spherules yellowish globose somewhat fleshy, Orifices short cylindrical surrounded by an orange web
16404 Somew innate parallel confluent black burst. with paral. slits, Thallus black, Perith in rows connate
16405 Scattered, Perithecia immersed globose, Orifices min convex peeping out of a black spot becom. bossed
16406 Gregarious, Perithecia somewhat immersed ovate black, Orifice bursting conical acute
16407 Gregarious, Perithecia covered ovate black, Orifices bursting equal smooth longer
16408 Scattered under the epidermis which is very convex and ruptured in the centre, Mouth very short obtuse not exserted, Sporules oval in filiform tubes
16409 Scattered globose with a very short rounded umbilicated mouth · at first the mouth only visible at length the spherule itself semi-exserted falling out in decay and leaving a cavity
16410 Spherules minute scattered very numerous black round depress. Orifice papilliform piercing the epidermis like minute dots at length naked when it decays
16411 Spherules excessively minute scattered forming dark greyish cloud-like longitudinal spots on the smooth stalks of plants: the orifice somewhat acute penetrating the epidermis

b Spherules without an evident orifice

16412 Parasitic on the leaves of dead grasses scattered brown black white within flat hemispherical. the apex furnished with a tuft of black rigid diverging hairs
16413 Scattered or in small groups minute blackish roundish producing pale spots on the leaf
16414 Scattered very gregarious fructiform somewhat shining rarely dehiscent
16415 Excessively minute very gregarious so as to form dark cloud-like irregular spots on the leaf
16416 Spherules very numerous punctiform glaucous or blueish-black rendering the leaf pale
16417 Bursting forth lin black with hardly any thallus, Perithecia in 1 or 2 rows somew connate black inside
16418 Gregar conflu cover with a blackened epider Perith deform black disk finally burst forth and opaque

16419 Forming nearly equidistant spots upon the stems of large dead herbaceous plants, Very common



** Spherules with an orifice, not hairy*

16420 Black globose nearly smooth crowded the orifice minute slightly papilliform
16421 Fine red min smooth gregar glob with a very min papill orifice, Spher at length collapsed and concave
16422 Black scattered gregarious roundish ovate acute shining the mouth papilliform
16423 Subgregar or scattered sessile orange-colored smooth glob destitute of orifice whit and filament at base
16424 Perithecia glob submmers Orifices promin convex furnish with an effused filament strat of a yell color
16425 Globose deformed brownish-black banded within with concentric layers, Perithecia oblong immersed
16426 Convex pulvinate fuscous whole-colored inside, Perithecia globose, Orifices bossed
16427 Effused thin flattened black, Perithecia subglobose prominent pimpled
16428 Dark, Layer diffused branched, Perithecia oblong smooth pimpled
16429 Elliptical smooth black white inside, Perithecia immersed ovate without orifice
16430 Of a regular figure very flat contigu dark extern and internally, Perith immers. ov Orif glob promin
16431 Orbic conv separ Layer white, Perithecia min Orifices numer disengaged glob and rostell somew rug
16432 Pustular, Layer adhering to the bark and emerging, Disk palish, Orifices exserted oval and rostellate
16433 Perithecia subovate, Orifices long thickened at end united in an opaque disk bursting transversely
16434 Minute circinate, Perithecia about 6 ovate and converging, Orifices round somewhat tapering emerging
16435 Cæspitose growing to the surface, Perithecia stalked ovate acute smooth dark
16436 Gregarious soft, Perithecia globose smooth somew pimpled orange-red becoming concave by collapsion

16437 Scattered soft very small, Perithecia ovate smooth pimpled crimson
16438 Dark, Perithecia thin globose smooth, Orifice papillæform
16439 Black shining, Perithecia globose rigid smooth, Orifice papillæform
16440 Sess. min soft aggregated or scattered smooth blood-red, Perithecia subglob collapsing, Orifice papilliform

*** Spherules with an orifice, hairy*

16441 Rather large brownish-black shining globose with a papilliform orifice arising from a dense brown filamentous stratum which sometimes partly envelopes the sperules
16442 Gregarious somewhat clustered quite black, Spherules roundish ovate somewhat tuberculate with short rigid scattered hairs, Orifice obtuse
16443 Spherules minute crowded roundish when young appearing like one mass of diverging brown hairs at length almost naked towards the apex and black, Orifice minute papilliform
16444 Black gregar hemispher minutely granulat the apex naked somew shin, the base hairy, Orif papill
16445 Gregar very crowd ov somew acum orange, Orifice moist but the spherules escape in a pulverul form
16446 Gregarious rose-colored, Spherules ovato-globose subacute or papillose placed on a paler colored web

and Miscellaneous Particulars.

History, Use, Propagation, Culture,

cult of determination Most of them are highly curious objects when minutely examined, and some even beautiful. Sphæria militaris is a fine species, about an inch in height, the head being ovate, of a beautiful scarlet, granulated like orange-peel

2426. *Lophium* So named from λοφος, a little elevation Differs from Sphæria in being completely evolved, dehiscent, compressed, without a veil, and having a nucleus crumbling to powder. The plants are very similar to the valves of a bivalved shell

2427 *Sphæronæma* From σφαιρα, a sphere, and νημα, gelatine, in allusion to the round mucous bag in which the sporules are enclosed The species are minute innate plants, generally growing on wood, very permanent, and often cohering by their base

2428 *Septaria* Growing upon dead leaves, in the form of clouds or spots Named upon account of the septa of the sporidia

2429. *Cytispora* From κυτις, a little chest, and σπωρα, a sporule. The species are very common, growing upon plants, immersed, soft, bearing fruit during damp weather, and even by watering only, within doors. The most essential character consists not in the cirrhi, common to many fungi, but in the deformed cellular perithecia, by which it may be easily known in any state.

16447 Perithecia somew ov. rather wart. black cover with strigose hairs of same col. Orifice rather lengthened
β Perithecia numerous seated on a little strigose villous crustaceous stalk

**** Spherules without an evident orifice*

16448 Gregarious obovate deep-black smooth tuberculated
16449 Spher minute solitary or somew cluster black ovate setoso-rugose mouthless, Spor. ovate in cylindr tubes
16450 Minute black scattered globose very rugose and tuberculated parasitic on the pileus of Polyporus abietinus
16451 Scatter Perith ellipt. rounded depress plaited lengthwise opaque black, Orifice hidden somew compress
16452 Spher black min very numer crowded roundish somew tuberculated and often with a transverse furrow
16453 Emerging prominent irregular brownish-black rutous brown internally, Orifices concealed
16454 Tufted innate on the surface, Perithecia subglobose solid without orifice at first villous afterwards naked
16455 Naked more or less crowd ovate-glob black shining, Perith very small smooth at first without an orifice
16456 Minute black scattered globose very warty, Parasitic on the cap of Polyporus abietinus
16457 Perithecia subglobose ovate tuberculate black covered with scattered hairs of the same color

16458 Stipit compress black transverse striat dilat gradual from stipes into an elongat wedge-shap. perithecl.
16459 Somewhat stalked dilated upwards striated across shining

Division II. *Cytisporei*

16460 Perithecia conico-subulate acute yellowish somewhat pellucid, Globule very pale

16461 Spherules aggregated, Sporidia 3 or 4 times divided. Cirrhi often becoming effused

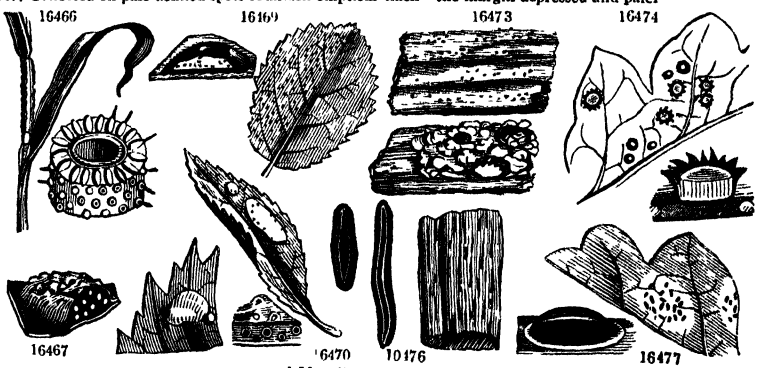
16462 Cells impressed on the receptacle, Disk emerging blackish, Cirrhi yellow [with a cottony margin
16463 Sporulifer tendr. white simp Spher waved when divid horizontal manifest under epider Orifice black.

16464 One or many-celled convex brownish-black somewhat umbonate in the centre
16465 Generally many-celled roundish flat brownish-testaceous, Orifices obsolete

Division III *Phacidiaceæ*

16466 Long, surrounding the culms whitish becoming dark-yellow at length rendered granular by the orifices

16467 Epiphyll round confluent convex cinereous-black internally black with white cells, Orifices like granulat
16468 Epiphyllous subgregarious hemispherical smooth shining very black white within



16469 On both sides of the leaf regularly scattered roundish black shining collapsed rugose and plaited

16470 Plane orange-red, Sporules unequal globose
16471 Plane pale fulvous
16472 Epiphyllous somewhat angular and irregular in form subconfluent tuberculose black shining black within the cellules white

16473 Minute innate on the surface rugose plaited opening with many flexuose cracks

16474 Orbicul subhemispher depressed black dehiscent in numer acute segm Disk pale greenish or yellowish
16475 Four-sided small black or whitish spots on the leaf splitting in 4-5 acute segments, Disk dingy

16476 Subimmersed crowded parallel linear black, Lips of the orifice tumid smooth, Disk linear
16477 Collected on pale defined spots roundish elliptical black the margin depressed and paler

and Miscellaneous Particulars

2430 *Phoma* Said by its author to be named in allusion to the pustular appearance of the plants, which are of a brownish color, and grow within the substance of leaves

2431 *Dothidea* A genus which has been named from δοθιην, a tubercle, and ειδος, similar, and appears to be very distinct. The species are numerous, growing upon plants, many of them are innate and dark, a few colored

2432 *Rhytisma* From ῥυτις, a wrinkle *R.* corrugatum, the Lichen graniformis of English botany, is a gregarious, subcorneous, shining flattish plant, referred to Lichens by Acharius, but considered by Fries and Ehrenberg to belong to Fungi It is common upon the crusts of Lichens and upon dry wood.

2433 *Phacidium* A name with the same meaning as Dothidea, from φακις, and ειδος Intermediate between Rhytisma and Hysterium, but differing from both in the manner of dehiscence The species are somewhat innate, epiphytous, tolerably permanent, blackish, and with a kernel which becomes softish

2434 *Hysterium.* From ὑστερησις, penury, in allusion, perhaps, to the diseased and squalid appearance which trees attacked by this fungus assume. Minute plants, resembling Opegrapha, and like that genus, found occupying the bark of trees, but destitute of a crust.

History, Use, Propagation, Culture,

2435 *Actinothyrium* So called from ακτις, a ray, and θυεος, to enclose, in allusion to the radiated integument of the sporidia. The only known species is innate, growing upon plants, orbicular, almost black, and appearing in the early part of the year

2436 *Leptostroma* From λεπτος, thin or delicate, and στρωμα, a layer, in allusion to the disk, which, when the perithecium separates, becomes naked and very thin.

2437. *Xyloma* From ξυλον, wood, and λωμα, a margin The species are innate coated tubercles, of a hard vesicular substance, but which does not produce fructification One of the most common kinds, X. acerinum, has a ragged border

2438 *Lasiobotrys* From λασιος, wool, and βοτρυς, a bunch This plant originates beneath the epidermis of the leaf, during its green and living state. When mature, it is of a very black color, and regular circular form, from one to two lines in breadth, very slightly convex, the surface uniformly granulated, and the whole generally situated on a paler or colorless portion of the leaf. On the bursting or laceration of the epidermis of the leaf, which takes place in the centre, our plant is found to consist of a multitude of distinct perithecia of a roundish form, closely arranged side by side, destitute of orifice, and the summits of which produce a granulated appearance to the naked eye or a small magnifier These perithecia are fixed to the leaf by a number of short filaments radiating from their base, and are not to be detached without some

16478 Ellipt or obl atten. each end black somew. shin. obscure striat. Sum. of sporulifer cells obtuse. club-shap.
16479 Innate scattered elliptical obtuse rather tumid smooth naked black with a longitudinal depression
16480 Minute black irregularly gregarious oval or roundish convex, Sporuliferous tubes club-shaped
16481 Gregarious black oblong or roundish-elliptical obtuse somewhat striate
16482 Convex tumid oblong-elliptical very black disposed in a subconcentric manner, Sporules large obl. yellow
16483 Bursting through the bark oblong elliptical flexuose somewhat ventricose greyish-brown
16484 Gregarious linear narrow parallel smooth of dull black
16485 Minute oval elliptical very black disposed in a subconcentric manner, Sporules large oblong yellow
16486 Very min. oval shin somew plane growing longitudinally on leaf, Sporulifer. tubes clavate acum. at apex
16487 Very minute linear elliptical black mostly on the ribs of the leaf or culm

Division IV *Xylomacei.*

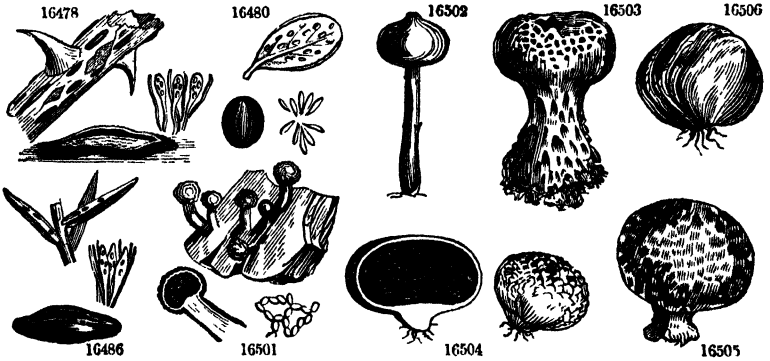
16488 Scattered or gregarious orbicular ½ to ¾ line broad, very dark a little ribbed and elevated in the centre

16489 Orbicular opaque bossed in the centre at length entirely separating, Disk whitish

16490 Black spreading in large irregular spots which are either uniform or composed of somewhat distinct dots dehiscence irregular and rugose
16491 Large irregular very thick black white within
16492 Gregarious sometimes crowded roundish slightly convex brown at length blackish
16493 Gregarious rarely scattered over the whole surface flattish irregular smooth dull-brown
16494 Scattered black unequal in size plane the surface rugose and somewhat papillose in the centre
16495 Minute crowded often in circular groups round black shining plan. rugose
16496 Minute roundish regularly scattered black shining smooth the upper half separating
16497 Clustered orbicular black becoming open, Margin erect somewhat crenate, Disk pale

16498 Perithecia even much crowded black: the radiating fibres simple

16499 Filam black radiat subdichotom at length covered with confluent rugoso-plicate shining black tubercles
16500 Filam. very min. extremely fine branch at length subdist. black, Tubercles producing a pale spot on leaf



Class III TRICHOSPERMI — Division I *Lycoperdinei*

16501 Stipes short somewhat fibrous, Peridium scabrous always closed, Sporules ovate

16502 Stipes smoothish, Peridium globose, Orifice flat

16503 Large gregarious subglobose yellowish-brown, Scales small numerous, Stipes subelongated incrassated below lacunose and variously divided at the root
16504 Globose subdepressed very firm smooth or warty sess or with a very short thick stipes, Root scarcely any

16505 Middle-sized roundish long-rooted pale lemon-color obsoletely scaly, Scales thickish
16506 Gregarious smaller somewhat spotted smooth brown, Root hard fibrous

and Miscellaneous Particulars.

force Their surface is smooth black Within they are replete with a somewhat gelatinous granulose mass, containing subglobose sporidia. The above is a description of the usual appearance of this plant.

A variety, however, occurs in the form of a ring or annulus, the centre being unoccupied. Sometimes the perithecia are scattered in irregular groups, a few together, and may even occur solitary

2439 *Asteroma* So named by Decandolle; but we know not with what meaning Many of the substances referred to this genus are believed to be merely young states of various kinds of Dothidea, some are the black lines by which certain Pyrenomycetes are bounded, others are merely darkened veins of leaves. To this the whole of Actinonema of Persoon, and several of his Capillarias are to be referred

2440. *Onygena* So called from *ονυξ*, a hoof, and *γινομαι*, to be born, in allusion to the singular circumstance of the original and only species being always found on old horse-hoofs in shady woody places.

2441. *Tulostoma.* From *τυλος*, a wart, and *στομα*, the mouth, in reference to the nature of the orifice by which the seeds of this plant are dispersed. T brumale is found on the mossy tops of walls about London in the winter and spring It may easily be overlooked for some unexpanded Agaric.

2442. *Scleroderma.* So called from *σκληρος*, hard, and *δερμα*, skin, in allusion to the hardness of the coat of the species S. spadiceum is found on heaths in England, but is very rare, it is about the size of a chesnut, rather depressed at the top.

History, Use, Propagation, Culture.

2443 *Lycoperdon* So called by Tournefort, from λυκος, a wolf, and πεδω, to explode backwards, that author certainly having improved upon the foolish old name, Crepitus lupi, by making it less generally intelligible (*Smith*) These are roundish tuber-like plants, when ripe, exploding and emitting the sporules in the form of smoke, whence country people call the species puff-balls.

2444 *Bovista* A name of barbarous origin, having been formed by Dillenius, from the German *Bofist* Bovista furfuracea, an Italian species, is said by Micheli, to be common on heaths near Florence, where it is sold with others of its tribe, as an article of food Bovista gigantea is the largest of the genus, and, indeed, of the whole order, measuring not unfrequently nearly 2 feet in diameter Bulliard mentions having seen many of eighteen, twenty, and twenty-three inches in diameter, and on the authority of others, affirms them to attain the enormous bulk of nearly nine feet in circumference The flesh is at first white, afterwards of a greenish-yellow, lastly of a brown-grey The outer peridium cracks and peels off in large flakes on being handled.

2445 *Geastrum* So called from γης, the earth, and αστηρ, a star, in allusion to the stellate appearance of the species when burst and lying on the ground A genus formed by Micheli upon the Puff-balls with a stellated volva.

2446 *Craterium* So named from κρατηρ, a cup, in allusion to the form of the peridium, which in C. vulgare is formed like a small goblet. This is a minute subsolitary plant, with the habit of Calicium.

16507 Large obconical soft whitish plicate beneath, Scales broad often indistinct
16508 White soft hemispherical subsessile somewhat smooth, Warts scattered
16509 Large white variable, Peridium subglob cover with spinul. warts, Stipes somew smooth long and plicate
16510 Cæspit. pyrif umbon pale-brown, Scales in form of min. slender spin process. Root consist. of long fibres

16511 Large white becoming blackish-brown plicate beneath
16512 Almost sessile very large globular yellowish-white, with scattered nearly obsolete scales

16513 Volva multifid, Peduncles and oscula of the peridium numerous
16514 Smaller, Head flat above, Orifice acuminate with longer cilia
16515 Peridium globose stalked, Orifice hoary, Radii somewhat quadrifid arched
16516 Volva multifid spreading, Lacinia equal, Head depressed spherical sessile, Orifice acuminate

Division II *Trichocists.*

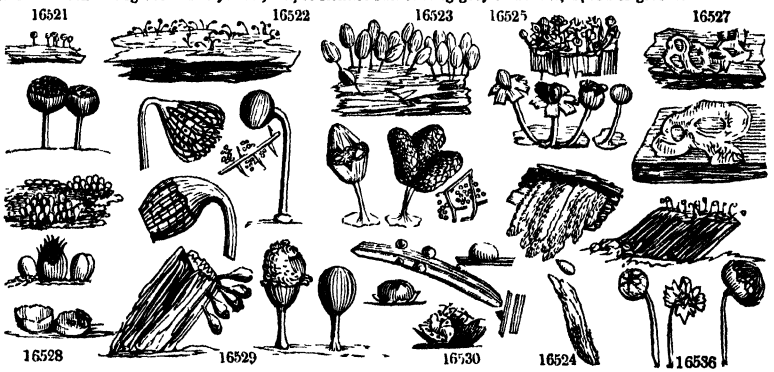
16517 Cup-shap redd.-brown, Operculum convex whit very thin evanescent, Filam. white, Sporules very dark
16518 Campanulate chesnut-color, Operculum firm white, Stipes orange, Sporules blackish

16519 Crowded cylindrical, Stipes black arising from a shining subjacent membrane, Peridia very fugacious blackish-brown, Stipes continued to the summit of the peridium
16520 Dark-brown globose stipitate, Stipes penetrating through the summit of the peridium

16521 Gregarious roundish, Stipes short blackish

16522 Gregar brownish-purple nodding umbilicated, Membrane of peridium deciduous, Flocci persistent robust

16523 Gregarious often cæspitose stipitate dull crimson, Sporules abundant crimson-red



16524 Pale-yellow substipitate cylindrical long weak drooping

16525 Yellow globose stipitate, Peridium splitting into holes which are beautifully expanded and reflexed
16526 Sporangium sess Peridium splitting into many regular reflexed segm Colum very min Spor pedicellat

16527 Effused forming an irregular sort of reticulation yellowish or pale-brown
16528 Crowded obovate ochrey-yellow bursting at the summit
16529 Shortly stipitate reddish at length yellowish bursting at the apex plicate beneath

16530 Sessile subglobose smooth greyish-white both of the peridia fragile, Sporules globular

16531 Head globose flattish beneath grey inclined, Stipes rather long pale weak sulcate, Sporules dark-brown
16532 Head glob flatt ben blueish-grey nodd Stipes thin weak whit not furrow Spor and filam dark-brown
16533 Head globose dark-grey, Stipes long firm black, Sporules and filaments very dark
16534 Subglob umbilicate ben yellowish-green, Stipes slender rather weak brown Sporules and filam very dark
16535 Head globose depressed pale-glaucous, Stipes very short thick pale at length brownish
16536 Peridium subglobose fine yellow, Stipes slender rather long greyish-brown, Sporules globose

and Miscellaneous Particulars.

2447. *Stemonitis.* From στημων, a stamen, in allusion to the form of some of the species, which may be compared to the male organ of a flower, taking the stipes for the filament, and the head for the anthera

2448 *Cribraria* A genus formed by Schrader out of the Sphærocarpi of Bulliard. It has for its essential character, a peridium, the upper part of which has numerous apertures, whence the name, from *cribro*, to perforate All the species are found in autumn upon rotten wood.

2449 *Dictydium.* From δικτυον, a net, and ειδος, similar, the peridium appears like net-work fastened together by minute delicate ribs Very minute pinheaded plants, with the appearance of Calicium.

2450 *Ayscyria* From αγκυς, a net The sporules are fastened together by a net-work of fibres. Beautiful little minute fungi, found upon wood.

2451 *Leangium* From λυος, smooth, and αγγιος, a vessel, in reference to the smoothness of the peridium. Small wart-like plants, resembling a minute Lycoperdon

2452. *Trichia* From θριξ τριχος, hair, in allusion to the internal mass of elastic fibres gradually expanding after the head bursts These are pin-headed plants, growing upon old wood, and very rarely seen in this country

2453. *Didermа* From δις, double, and δερμα, a skin, on account of the double peridium

2454. *Physarum* So named, on account of the bladdery appearance of the peridium, from φυσα, a vesicle

History, Use, Propagation, Culture,

2455 *Leocarpus* A word with the same meaning as Leangium; which see L. vernicosus appears as if varnished over with vermilion The plants grow in clusters upon bits of rotten wood, and are each formed of a pear-shaped stalked peridium, bursting at the end, and letting fall out a nucleus of sporules held together by fibres

2456. *Lycogala* From λυκος, a wolf, and γαλα, milk, a genus of fungi whose internal appearance and substance in an early state are like a mass of thick cream. It is included under Mucor by Linnæus, Schreber, and others. L. argenteum is found upon rotten wood in the autumn It is about an inch or more in diameter, brown and pulpy when young, of a brilliant white when arrived at maturity, discharging, by one or more irregular accidental openings, a mass of rich dark snuff-colored powder

2457 *Spumaria* From *spuma*, froth S mucilago is spread in the autumn over the leaves and stems of living plants, or over dead branches, when it resembles in some measure stiffened foam or froth

2458 *Dichosporium* From δις, double, and σπορα, a seed, in allusion, we presume, to the double coat of the peridium, the innermost of which is formed of granules like sporules. The only species known is found upon the bark of the oak.

2459. *Licea.* The meaning of this word is unexplained The species have been referred to Trichia, Didy-

16537 Shortly stipitate obovate reddish-brown shining crowded, Stipes whitish

Division III. *Fuligmoidei.*

16538 Globular gregarious red changing to brown, Sporules orange-red at length purple-grey
16539 Large suboval very fragile silvery-white, Sporules profuse deep-brown, Filaments few

16540 Minute white roundish depressed rarely confluent fragile, Sporules black intermixed with a few filaments

16541 Effused frothy, Peridium furnished internally with horn-like grey processes inclosing brown sporules

Division IV. *Lycoidei.*

16542 The only species

16543 Gregarious sessile yellowish or chesnut-brown subglobose the upper half of the peridium separating like a lid, Sporules rarely mixed with one or two filaments
16544 Peridia cylindrical very fragile densely crowded forming a roundish or hemispherical mass dull-red changing to pale-brown, Sporules brown in the form of minute abundant dust

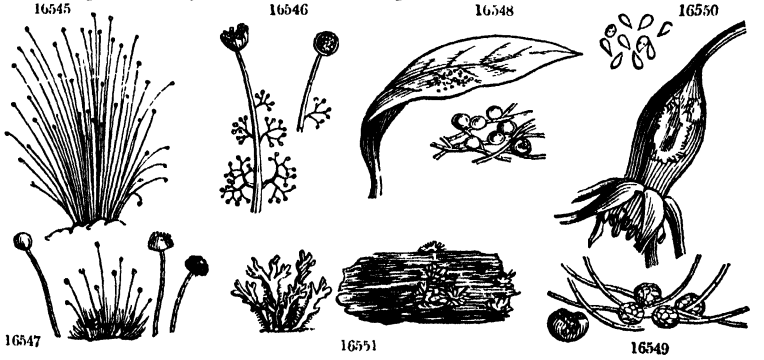
Class IV Mucoroidei

16545 Byssus-like white becoming yellowish, Stipes erect or lax simple bearing a minute subglobose head

16546 Filaments branched whorled, Peridium elevated

16547 Stipes simple, Heads inflated spherical dark-grey bursting close to the stipes which is long and filiform

Class V. Perisporia



16548 Gregarious punctiform yellow, Filaments whitish branched
16549 Tufted, Peridia gregar. greenish covered by the filam which are elongat simple profuse somew erect in [centre

16550 Changes from yellow to grey

HYPHOMYCETES.

Class I. Cephalotrichi.

16552 Growing in small tufts, Filaments subconfluent simple or branched and fasciculated

and Miscellaneous Particulars.

mium, &c. by various writers They are minute productions scarcely bigger than pins' heads, found chiefly on rotten wood of the fir kind

2460 *Mucor* An alteration of *μυκης*, the name of a small fungus To this genus are referable the greater part of the substances which form the mould upon cheese and other materials.

2461 *Thamnidium* From *θαμνος*, a rod or twig, in allusion to the appearance of the plants under the microscope Minute plants, with a bushy branched stipes, and a head like that of Mucor

2462 *Ascophora* From *ασκος*, a term used by mycologists to denote a peculiar kind of receptacle of sporules, and *φερω*, to bear These are pin-headed fungi, with the habit of Mucor, from which they chiefly differ in their peridium being turned inside out after bursting, and being somewhat persistent.

2463 *Eurotium.* *Ευρως* was the Greek name of a sort of mouldiness, and has been with a sufficient reason applied to this genus of plants

2464 *Amphisporium.* From *αμφι*, double, and *σπορα*, a sporule. These organs are of two forms, either roundish with three dots in the middle, or ovate acuminate, and quite pellucid.

2465 *Ceratium.* So named from *κερας*, a horn, on account of the cornute appearance of the plants under a microscope.

History, Use, Propagation, Culture,

2466. *Isaria* From ισος, equal, on account, perhaps, of the equality which exists among the filaments of the plants both in size and length

2467 *Stilbum* From στιλβος, shining The species are all found upon old rotten wood, and are at first watery or gelatinous, but become opake and turbid as they ripen

2468 *Torula* A diminutive of *thorus* or *torus*, a bed. This plant forms a thick compact bed or layer upon the plants on which it grows

2469 *Monilia* From *monile*, a necklace, with reference to the peculiar manner in which the filaments are articulated.

2470. *Racodium* Ρακιον was the name among the Greeks for a worthless worn-out ragged garment, and has been applied to the present genus, in allusion to the dirty interwoven cloth-like substance with which it clothes whatever it grows upon. R cellare is the black substance which overruns the bottles of the wine merchant, and which often hangs in long thick festoons from the sides and roof of his cellars

2471. *Dematium* A diminutive of δεμα, a bundle or parcel The filamentous thallus is often collected into bundles.

2472. *Cladosporium.* From κλαδος, a branch, because the sporules are attached to the branches of the fungi.

2473. *Helicosporium.* From *helix*, a spiral, in allusion to the manner in which the sporules are curved.

16552 Extremely minute scattered simple club-shaped very white, Filaments and sporidia indistinct

Class II STILBOIDEI.

16553 Head roundish whitish semifluid becoming firmer and yellowish, Stipes rather thick cylindrical

Class III INOMYCETES. — Division I. *Byssacei.*

16554 Filaments densely crowded so as to form a black crust

16555 Tufted gold color

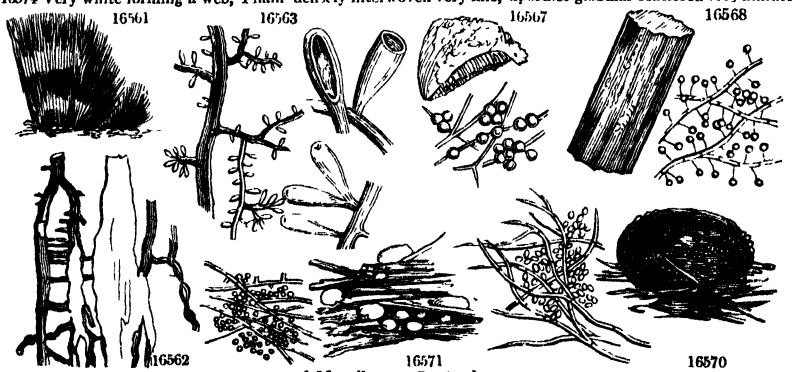
16556 Very soft lax much interwoven of a greenish black color, Filaments intermixed with irregular granules

16557 Minute blackish fascicled, Bristles diverging sometimes jointed

16558 Tufted extremely minute of an olive-green color becoming blackish and rigid in old age
16559 Very minute spreading on old wood in wide velvety patches greenish-black, Filaments simple or branched jointed somewhat thickened upwards

16560 The only species

16561 Very irregular rigid diverging when young from a common centre, afterwards straggling, Filaments tawny orange-color compressed of various sizes



16562 Compressed brown or black shining anastomising often broad and very extensive [regularly patent
16563 Stem pale redd cylind subflex never anastomis Branches spread in all directions free, Fructific clavate
16564 Stems covered with a mealy substance
16565 Long branched roundish somewhat sep rate black
16566 Round much branched snow-white, cellular and yellow inside

Division II *Mucedines*

16567 Spreading widely within putrefying *Agarics* and *Bolets*, Filam. white, Spor profuse bright orange-yello

16568 Filaments spreading branched olive-brown, Pedicels of the sporules numerous alternate

16569 Forming a pulverulent hoariness interspersed with very minute tufts, Filaments few branched straggling, Sporules large obtusely oval
16570 Tufts roundish minute very white, Filaments loosely entangled, Sporules very numerous oval
16571 Tufts yellow irregular roundish, Filaments lax entangled, Sporules numerous subglobose
16572 Tufts of a reddish orange-color, Filaments very slender much entangled, Sporules glob. extremely minute
16573 Differs from the last, chiefly in its paler color
16574 Very white forming a web, Filam densely interwoven very fine, Sporules globular scattered very minute

and Miscellaneous Particulars

2474 *Oxonium* We presume, from ὄξος, a branch, in allusion to the manner in which the filaments branch or diverge from a common centre This genus has been extracted from Dematium by Link

2475. *Rhizomorpha* So called from its resemblance to the branching fibrous roots of various plants. All the productions referred to this genus are very obscure and uncertain R phosphorea, the Clavaria phosphorea of Sowerby, is a plant sometimes existing as a parasite between the wood and bark of trees, or in wine-cellars among saw-dust, and is, when fresh, remarkably luminous in the dark

2476 *Sepedonium* From σηπεδων, putrescence The species grow among the decaying parts of fungi, and other putrid substances

2477 *Acremonium* From ακρεμων, a branch, the thecæ are produced about the filaments in fascicles, as branches are about trees.

2478 *Sporotrichum* From σπορα, and θριξ, hair, in allusion to the filamentous nature of the sporules A very destructive parasite in some seasons, and probably of general distribution, for it has been detected on a great variety of plants To gardeners it is well known as a kind of mildew or blight, and is commonly taken for an insect The leaves of the peach-trees, even when protected by glass, are often attacked by it, nor does the fruit itself always escape, in which case it frequently drops off The leaves are more or less distorted by it As its production is probably the result of a peculiar state of the atmosphere, there is little chance of any means being discovered for its prevention.

History, Use, Propagation, Culture,

2479 *Trichothecium.* The thecæ are intermixed among a mass of hair-like filaments; whence the name.
2480. *Acrosporium* From ακρος, the top of any thing, and σπορα, a sporule; the latter occupying the summit of the simple filaments.
2481 *Botrytis* So called from βοτρυς, a bunch of grapes, in allusion to the clusters of little globular seeds or seed vessels.
2482 *Aspergillus.* This is the name of the brush with which the holy-water is scattered in Catholic ceremonies. The little plant, consisting of a stem and a cluster of sporules at the top, is not unlike a little brush with its handle
2483 *Stachylidium* From σταχυς, a spike, and ειδος, similar. The sporules are dispersed in a sort of spiked manner on the filaments.

16575 Tufted, Tufts distinct at length sometimes confluent, Filam white, Sporules pink very numerous oval

16576 Filaments simple forming white spots of one or two lines in length on the living leaves of grasses
16577 Filam. branched somew fasciculated erect in spreading tufts white at first at length a fine glauc color

16578 Very lax tuft white branch. Branch few long spread set with short patent ramuli bear round clust of spor.
16579 Tufted confluent white, Filaments one line high, Branches divaricate, Sporules numerous ovate large
16580 Pale purpl -grey spread. Filam branch towards summ t, Branch. divaric. short, Spor. large oval numerous
16581 Somewhat tufted lax white not much branched, Sporules roundish

16582 Tuft. min formed of white erect filaments with little heads at first white but when mature of a glauc color
16583 In dense tufts composed of whitish or yellowish suberect entangled filaments with yellowish heads
16584 Tufts rather dense, Filaments entangled suberect heads as well as the filaments greenish
16585 Filaments scattered gregarious about a line high supporting an elongated tuft of beaded sporidia

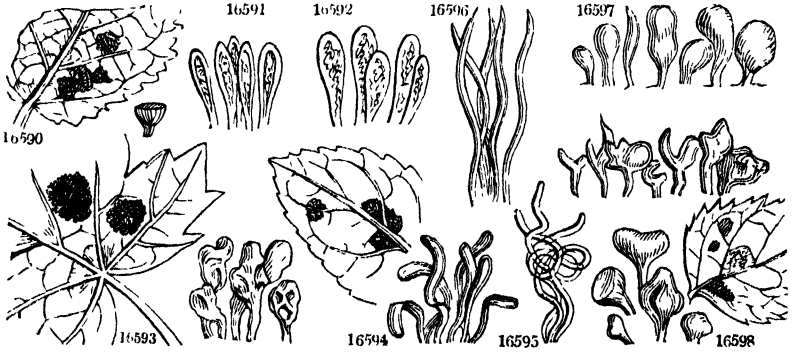
16586 Filaments branched erect remotely jointed scattered white, Sporules globular

16587 Barren filaments effused interwoven fertile ones simple somewhat scattered, Heads of sporules white
16588 Densely tufted spreading, Heads of sporules at length glaucou

16589 Tufted, Tufts roundish composed of snow-white interwoven filaments, Sporules profuse green at length giving the whole a green-color

Class IV PHYLLERIACEÆ

16590 Irregularly tufted or effused and confluent whitish at length reddish-brown, Peridia shortly branched, Branches thick bearing several round or ovate lobes



16591 On the surface of the leaf bright gold-color effused sometimes spreading over the whole leaf, Peridia simple crowded club-shaped, Sporules evident excessively minute yellow
16592 Hypophyllous, so minute as scarcely to be raised above the surface of the leaf pale obscure purple widely effused, Peridia simple obtusely club-shaped
16593 On the under surface of the leaf depressed distinct or confluent pale becoming reddish-brown, Peridia club-shaped very rarely turbinate flaccid, the upper half often inclined
16594 Mostly on the under surface of the leaf scattered subeffused rich reddish-brown, Peridia compressed in somewhat lax with the apex club-shaped and often truncate
16595 Mostly on the under surface irregularly tufted whitish becoming ferruginous, Peridia linear cylindrical twisted with rounded summits
16596 Hypophyll silky or tomentous pale or quadrangular, Peridia erect cylindric long and attenuated to a point
16597 On the under surface whitish-pink becoming subferruginous rarely in the form of spots or tufts but confluent at the margin of the leaf which is rolled inwards and conceals it, Peridia short
16598 Mostly on the upper surface unequally scattered confluent fine crimson, Peridia polymorphous turbinate club-shaped or capitate, the summit frequently truncate
16599 Mostly on the under surface whitish at length dark ferruginous often confluent, Peridia short polymorphous sometimes turbinate but generally with two blunt horn-like patent summits

CONIOMYCETES.

Class I TUBERCULARIÆ

16600 Gregarious deep-red rugose furnished with a very short thick pale stipes

16601 Gregarious confluent depressed flesh-red small somewhat plane
16602 Somewhat round somewhat shortly stipitate dull-red at length black, Surface tuberculate wrinkled

and Miscellaneous Particulars

2484 *Penicillium* A name with the same meaning as Aspergillus, to which genus this is extremely similar in appearance

2485 *Trichoderma* From θριξ τριχος, hair, and δερμα, a coat The threads to which the sporules are attached spread round, radiating through the powdery mass in little tufts from a subjacent membrane.

2486. *Rubigo* An ancient Latin name of blight There was a inferior deity whom the Romans acknowledged under the name of Rubigus, and whom they propitiated in bad seasons All the productions referred either are popularly called mildew or blight.

2487 *Erineum* So named in reference to its hispid appearance, which resembles the common hedge-hog, Erinaceus Found growing upon leaves in little tufts

2488 *Tuberculariæ* So named in allusion to its warted appearance

History, Use, Propagation, Culture,

2489 *Fusarium* The sporules are remarkable for their regular *fusiform* figure.

2490. *Exosporium* So called by Link, from ἐξ, on the outside, and σπορος, a sporule, on account of their external situation Entire plant about one-third of a line in diameter, rarely larger, very gregarious, deep black, convex, bursting from beneath the epidermis, and appearing bristly under a pocket magnifier Sporidia very crowded, elongated, obtuse at the apex, subopake, divided transversely about five times, fixed at the base upon a roundish dark-colored, solid receptacle, and there persistent.

2491 *Fusidium* A name with the same meaning as Fusarium

2492 *Polythrincium* From πολυς, many, and θρυγχος, a little division To the naked eye, this little plant appears in the form of numerous minute black spots of unequal size Under the microscope, these spots are each found to consist of a number of distinct little roundish tufts of filaments, nearly equidistant from one another, and becoming smaller towards the circumference The filaments are densely crowded, semitransparent, gradually thickening upwards, somewhat moniliform from the numerous articulations, erect, simple, the sporidia oval, two-celled, scattered among the filaments.

2493 *Stilbospora* From στιλβω, to shine, and σπορος, a sporule. Asci or sporules naked, imbedded in a black substance flowing from the branches of trees

16603 Minute roundish or oval subgelatinous, Sporules long slender slightly curved

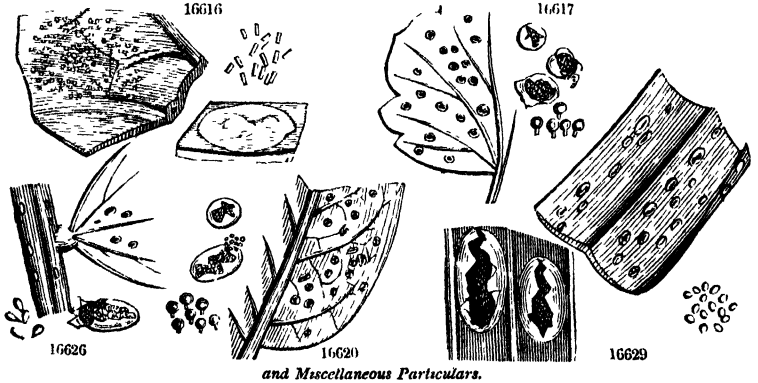
16604 Gregarious black minute convex, Sporidia elongated obtuse about 5 times transversely divided

Class II. ENTOPHYTÆ. — Division I. *Stilbosporei.*

16605 Mass thin irregular of a whitish or grey color
16606 Mass irregular thin bright-yellow or greenish

16607 The only species

16608 Heaps rather large, Sporidia extremely minute nearly equally 2-celled
16609 Black granulated irregularly ovate at length shapeless, Sporules ovate attenuated at each extremity
16610 Heaps small, Sporidia ovate umilocular
16611 Heaps roundish bursting through the bark, Sporules ovate obtuse 2-celled



16612 Black very crowded, Filaments linear-oblong 4 or 5 times divided

16613 Spherules depressed black immersed, Sporules large ovate escaping in the form of thick black tendrils
16614 Spherules very small grey black, Sporules excessively minute dust-like under a high magnifying power escaping in the form of long capillary entangled dull-orange tendrils
16615 Spherules waved when divided horizontally elevating the epidermis, Orifice blackish with a cottony margin, Sporules very minute forming a single short slightly tortuous whitish tendrils

Division II *Hypodermia*

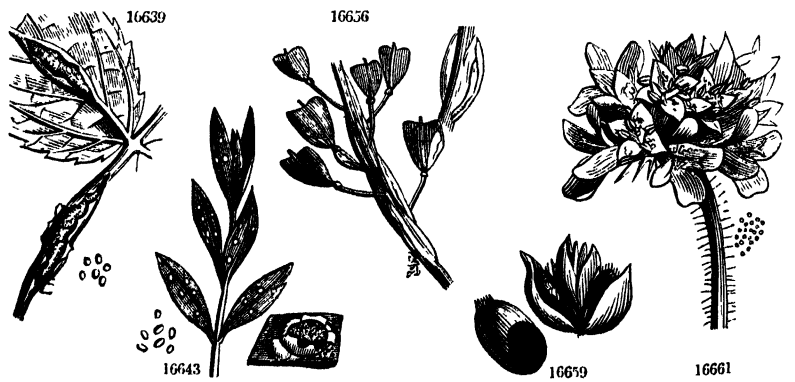
16616 The only species

16617 Hypophyllous scattered dark fuscous round very pulverulent sometimes confluent, Sporidia globose
16618 Aggregated deep-brown chiefly hypophyllous confluent, Sporidia oval sometimes with a very min stipes
16619 Hypophyllous scattered becoming confluent reddish or purplish-brown, Sporidia globose greenish under a high power of the microscope
16620 Hypophyllous circular scattered rarely disposed in a circle round a pale-brown centre, Sporidia globular
16621 Hypophyllous scattered single or disposed in a circle round a central one light-brown, Sporidia globular suboval and rarely furnished with a minute pedicel
16622 On both sides of leaf dark fuscous minute round scattered, Sporidia globular rarely with a minute pedicel
16623 Hypophyllous scattered sometimes subconfluent roundish light-brown girt by the remains of epidermis, Sporidia oviform sometimes furnished with a very short blunt pedicel
16624 On both surfaces of the leaf and opposite to each other scattered round light-brown girt with the remains of the epidermis, Sporidia globose
16625 On both surfaces of the leaf brown round minute often not bursting the epidermis rarely disposed in a circle, Sporidia ovoid sometimes with minute pedicels
16626 Scattered round depressed light-brown girt with the remains of the epidermis, Sporidia rounded or suboval rarely with minute pedicels
16627 Hypophyllous pale yellowish-brown sometimes disposed in a circle round a central one minute rarely confluent, Sporidia roundish or egg-shaped and rather hyaline
16628 Hypophyllous scattered or partially aggregated reddish-brown rounded somewhat prominent minute very unequal, Sporidia roundish or oval rarely pedicelled
16629 On both sides of the leaf scattered distinct oblong reddish-brown girt by the ruptured epidermis, Sporidia subglobose rarely subpedicelled

and Miscellaneous Particulars.

2494. *Sporidermium* From σπορος, a sporule, and δερμα, a skin, or coat. A plant of a very simple structure, composed entirely of linear-oblong or club-shaped semi-opake bodies, closely arranged side by side, exactly of the same height, and transversely divided by three or four dissepiments When viewed with the naked eye, it resembles an intensely black thin crust, creeping over the surface of Thelephora Specimens from Captain Carmichael, as well as those found by Dr. Greville, occurred on Thelephora vulgaris

2495 *Næmaspora* From νημα, a thread, and σπορα, a sporule. The species resemble distorted threads filled with minute sporules



2496 *Cylindrosporium* In allusion to the cylindrical form of the sporules. Found on both surfaces of living cabbage leaves (Brassica oleracea) Frequent in May and June A very extraordinary plant, forming minute speck-like heaps of an oblong shape, but otherwise very irregular, and projecting into little angles and processes They are disposed in a concentric manner, are pure white, and change in decay to a dirty yellow. Sporules naked, very numerous, cylindrical, truncate at each extremity, pellucid.

2497 *Uredo* An old Latin name, from uro, to burn or scorch, applied to those occasional discolorations of the surfaces of plants which were attributed to blasts or injuries of the atmosphere or heavenly bodies, and are

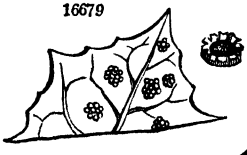
History, Use, Propagation, Culture,

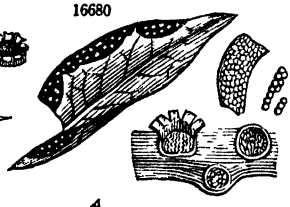
called mildew or blight. All the species are obscure and require further examination They are in the hands of Bauer, whose knowledge and pictorial powers cannot be better employed than in illustrating this obscure part of vegetation.

16630 Hypophyl scatter very min rounded becom contigu but not confluent, Sporidia pyriform subpedicellate
16631 Hypophyl very min convex orbicular scattered becom confluent, Sporidia very min globul transparent
16632 Hypophyl pale ochrey-yell distinct at first soon bursting becom conflu and very pulverul Sporidia oval
16633 Hypophyllous bright orange-yellow prominent crowded generally forming circles and becoming very confluent, Sporidia very numerous obovate
16634 Hypophyllous orange-yellow oblong irregular becoming confluent, Sporidia numerous
16635 Hypophyllous depressed yellow oblong concentric becoming confluent, Sporidia nearly oval
16636 Chiefly hypophyllous golden-yellow scattered irregular convex becoming confluent, Sporidia subspherica.
16637 Hypophyllous small scattered effused orange-yellow, Sporidia suboval sometimes with a minute pedicel
16638 Hypophyllous golden-yellow suborbicular becoming effused, Sporidia very numerous irregularly spherical
16639 Bright reddish-orange broad pulverulent hypophyl and on nerves and petioles, Sporidia numer subglob.
16640 Epiphyllous much scattered rather large yellow thick elevated from the leaf and bursting in a gyrose manner, Sporidia subglobose
16641 Hypophyl lin obl crowded arranged in a subparallel manner orange-yell becom pale, Sporidia spherical
16642 Hypophyllous and on the petioles and calyx oblong thickish sometimes partly disposed in a circular manner and subconfluent deep reddish-yellow, Sporidia spherical
16643 On both sides of the leaf and stem suborbicular prominent bright orange-yellow scattered, Sporidia oval or even oblong transparent
16644 Hypophyllous and on the calyces rather large oval with an indurated disk after the sporidia have escaped, Sporidia bright orange spherical and granular within
16645 Hypophyllous scattered round depressed rarely confluent, Sporidia yellowish-orange spherical surrounded by the remains of the ruptured epidermis
16646 Hypophyllous punctiform scattered or collected into small clusters golden-yellow scarcely bursting, Sporidia ovate or oblong somewhat transparent and granular within
16647 Hypophyll golden-yell scatter distin surround by remains of ruptur epidermis, Sporidia subglob minute
16648 On both sides of the leaf oblong or lin sometimes forming long lines yellow becoming reddish or brownish in decay, Sporidia globular or suboval
16649 Hypophyllous and on the petioles somewhat aggregated but generally following the course of the veins, bullated yellow bursting in the centre
16650 Chiefly hypophyllous very minute regular numerous convex late in bursting golden-yellow, Sporidia roundish oval or even oblong
16651 Chiefly hypophyllous very minute pale-yellow subrotund convex scattered or collected into clusters scarcely bursting, Sporidia suboval
16652 Hypophyll depressed regular in form redd orange scattered becoming partially confluent Sporidia egg-shaped
16653 Hypophyllous depressed minute spreading somewhat aggregated subconfluent irregular in form of a deep orange or orange-red, Sporidia oval
16654 Hypophyllous scattered or crowded distinct convex roundish large compared with the following mostly closed pale becoming golden-yellow, Sporidia very long obtuse at each extremity
16655 Hypophyllous punctiform prominent or papilliform numerous tawny yellow mostly closed, Sporidia ovate
16656 Polymorphous of various forms sometimes disposed in a circular manner quite white frequently never bursting, Sporidia in great profusion globular
16657 Within the fruit and glumes of corn and various grasses spreading and in a short time filling the whole with a profuse black dust, which under the microscope consists of minute spherical sporules
16658 Attacking the fructification of Carices and forming a black compact slightly pulverulent mass composed of a pale solid nucleus surrounded by the naked sporidia which are small and globular
16659 Always inclosed within the grain and filling it with uniform dense fetid blackish-brown mass composed of very minute spherical sporidia
16660 Attack anth and ovary of the *Caryophylleæ*, fine purp Spori very plentiful pulverul min and globul
16661 Sporidia very min purpl-brown plentiful produc within florets and often filling them with pulverul mass

16662 Large oblong or conical much scattered pale-orange bursting with an irregular orifice, Sporidia excessively abundant bright-orange
16663 Hypophyllous numerous distinct, Sporidia very white toothed, Teeth beautifully rolled back brittle and vanishing, Sporidia pinkish-orange
16664 Hypophyllous and on the petioles scattered or subaggregated numerous, Peridia whitish split into many small deciduous teeth, Sporidia orange becoming obscure brown
16665 Hypophyllous and on the petioles scattered distinct, Peridia very white split into a few comparatively large teeth, Sporidia yellowish-white, Surface of the leaf blistered whitish
16666 Hypophyllous very numerous subsessile scattered or collected into little clusters, Peridia white split into subrevolute teeth, Sporidia fine orange
16667 Hypophyllous, Peridia distinct but decidedly clustered and crowded prominent becoming subelongated, the mouth with a few broad very delicate deciduous teeth, Sporidia fine orange
16668 Hypophyllous and on the petioles irregularly clustered and deforming the parts on which it grows, Peridia somewhat indistinct round prominent and yellowish with a subentire orifice



and Miscellaneous Particulars.



998 *Eucalyptus* These plants are found upon the leaves of other vegetables, and one of them is known to agriculturists under the name of Red Gum This species usually grows inside the glumes of the calyx, under the epidermis, which, when the plant is ripe, bursts and emits a powder of a bright orange color It does not

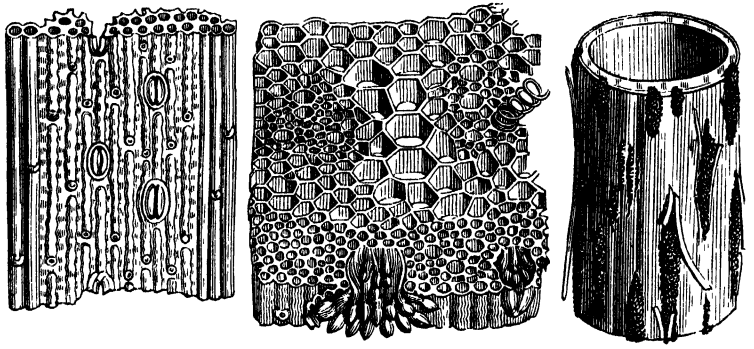
History, Use, Propagation, Culture,

appear to be materially injurious to the grain, if at all. Ears full of it have been found with very plump grains; and it has also been found upon branded ears. Before the cuticle which covers the fungus bursts, it has much the appearance of a pustule upon the human body

16669 Hypophyllous at first prominent pustular soon becoming agglomerated very numerous, Peridia splitting into short brittle yellowish-white teeth, Sporidia pale-orange
16670 Hypophyllous in widely scattered agglomerated clusters but not very crowded, Peridia subsessile split into very white exceedingly brittle teeth, Sporidia pale
16671 Hypophyllous and on the petioles and stem, Peridia campanulate agglomerated rarely single split into many short recurved teeth, Sporidia ochre-yellow numerous ovate
16672 Hypophyllous and on the petioles, Peridia in dense agglomerated clusters whitish split into revolute teeth, Sporidia yellowish the leaf whitish around the clusters
16673 Hypophyllous upon a thickened portion of the leaf, which on the upper surface is of a fine red color with a yellow border, Peridia densely crowded splitting into yellowish-white teeth, Sporidia pale
16674 Hypophyllous, Peridia agglomerated in scattered clusters of various sizes whitish with a brittle dentated margin, Sporidia yellow
16675 Hypophyllous and on the petioles aggregated short somewhat campanulate with numerous very minute marginal teeth, Sporidia bright-orange subglobose or oval
16676 Hypophyllous and on the fruitstalk, seed-vessel, calyx, and even petals, Peridia short or elongated cylindrical densely crowded fine orange, Sporidia yellow under the microscope
16677 Hypophyllous and on the petioles and young fruit, Peridia elongated agglomerated brown splitting to the base in capillary segments, Sporidia numerous light-brown
16678 Hypophyllous, Peridia 2—12 long cylindrical slightly curved yellowish-brown springing from an orange-colored thickened portion of the leaf, Sporidia numerous greyish becoming brown
16679 Hypophyllous marked on the upper surface of the leaf by a yellow or purplish spot, Peridia partly immersed short splitting into white revolute teeth, Sporidia pink-orange
16680 Hypophyllous producing a crimson spot on the upper surface of the leaf, Peridia minute subimmersed splitting regularly into small revolute white teeth, Sporidia yellowish-white
16681 Hypophyllous marked by a pale spot on the upper surface of the leaf and a pale ring round the peridia, which are small not numerous splitting into small brittle yellowish-white teeth, Sporidia pale
16682 Hypophyllous somewhat clustered, Clusters of a roundish form, Peridia oblongo-cylindrical bright-orange, Mouth paler and bursting irregularly

16683 Hypophyllous, Sporidia mucronated 5-7-celled with a white filiform stipes incrassated towards the base which is furnished with a yellow gland
16684 Hypophyllous deep-black tufted, Sporidia 4-celled obtuse mucronate, Stipes slender incrassated at the base
16685 Hypophyllous tufted of various sizes black rather far scattered, Sporidia 7-9-celled somewhat attenuated mucronate with a slender stipes incrassated at the base
16686 Somewhat tufted scattered black, Sporidia cylindrical 3-4-celled obtuse never mucronated, Stipes filiform
16687 Round or ovoid scatter black somewhat convex, Sporidia densely crowded oblong obtuse firmly fixed by pedicels
16688 Hypophyllous deep pinkish-brown pruinose consist of a number of distinct aggregate tufts, Sporidia oblong acute
16689 Hypophyllous small of various sizes few together and confluent pale brown, Sporidia long somewhat waved much attenuated at each extremity with an elongated stipes
16690 Hypophyllous punctiform minutely tufted subrotund blackish-brown, Sporidia crowded obtusely egg-shaped with a long flexuose filiform pedicel
16691 Chiefly hypophyllous minute aggregated rendering the nerves and petioles swollen dark bluish-grey before bursting, Sporidia nearly black oval not contracted in the centre, Stipes short
16692 Hypophyllous and on the petioles conglomerated confluent brownish-grey before bursting, Sporidia nearly black obtuse scarcely contracted in the centre the upper cell sometimes divided
16693 Hypophyllous round scattered nearly black, Sporidia of an obtuse irregular figure with a short filiform stipes somewhat incrassated at the base
16694 Hypophyllous minute round very crowded reddish-brown upper cell of the sporidia thick globose, the lower one long and narrow, Stipes short
16695 On both sides of the leaf and on the stem in small nearly black scattered tufts surrounded by the remains of the ruptured epidermis, Sporidia oval the two cells nearly equal, Stipes very short
16696 Hypophyllous minute very dark scattered, Sporidia short with both cells obtuse and a short stipes
16697 Hypophyllous circular very variable in size blackish-brown scattered rarely confluent, Sporidia very obtuse with a subelongated stipes
16698 On both sides of the leaf in minute tufts nearly black circular bordered by the remains of the epidermis, Sporidia variable very obtuse rounded 2-celled both often subdivided, Stipes very short
16699 Hypophyllous blackish-brown irregular in figure girt by ferruginous remains of epidermis, Sporidia crowded obtuse divided but scarcely contracted in the middle, Stipes short
16700 Hypophyllous scattered closely over the whole surface small round brown depressed, Sporidia much contracted in the centre nearly resembling figure 8 the upper cell largest
16701 Hypophyllous very thickly scattered and becoming contiguous but very rarely confluent minute at first and ferruginous after bursting, Sporidia short upper cell obtuse, Stipes very short
16702 Hypophyllous dark-brown scattered or sub-confluent often concentric, Sporidia crowded pulverulent obtusely oval slightly contracted in the middle the lower cell terminating in an abrupt and short stipes
16703 On the leaf and petiole crowded confluent, Sporidia dark-brown pulverulent upper cell obtuse, Stipes somewhat lengthened



and Miscellaneous Particulars

2499 *Puccinia* A name of obscure meaning, possibly derived from πύκα, closely packed, in allusion to the crowded manner in which the little plants are placed P grámmis is a plant too well known to the farmer under the name of blight It attacks the stem and leaves of corn, at first having the appearance of orange-

History, Use, Propagation, Culture,

coloured streaks, which afterwards assume a deep chocolate-brown colour The little plants chiefly attack the parenchyma, immediately below the stomata with which the cuticle abounds Each individual is so small, that any stoma on a straw will, according to Sir Joseph Banks, produce from twenty to forty fungi, and every one of them will, no doubt, produce at least one hundred reproductive particles, so that the progeny from a single stoma will be enough to infect a whole plant The period of a generation is supposed not to exceed a week, and as the reproductive particles are exceedingly light, they are wafted aloft in the air, which is thus loaded with clouds of animated dust, ready upon the first favourable occasion to carry blight and disease into all the neighbourhood The figures which illustrate this subject are copies of Mr Bauer's illustrations of blight, published in 1805 by Sir Joseph Banks *a* (preceding page), a piece of infected wheat stem, natural size, *b*, a highly magnified longitudinal cutting of the same, *c to n*, highly magnified representations of the Puccinia grámmis in various states, *o*, a piece of the cuticle magnified, and showing the stomata, *p*, a highly magnified transverse cutting of the straw, *q*, a magnified representation of the outside of the straw, *r*, a very highly magnified representation of a part of the same

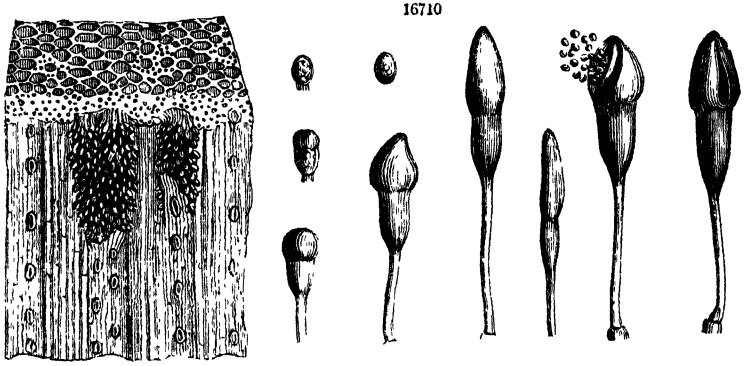
The alarming state of the harvest of August 1804, from what is vulgarly called blight, induced Sir Joseph Banks to have some blighted stalks of wheat examined under a powerful microscope, and drawings made from them by Mr Francis Bauer These were published in a pamphlet in January 1805, the object of which, as we are informed in the advertisement, was to procure "actual observations on the origin and progress of the disease" from those "intelligent agriculturists, whose residence in the country enables them daily to examine, not only the progress of their crops, but the origin and advances also of all those obstacles which nature has opposed to the success of agricultural labours, as if to awaken the energies of reason, and to reward the farmer for the exertions of his intellectual faculties, by the satisfaction of surmounting them"

As we have here a space that would otherwise be unoccupied, we cannot do better than to fill it up by transcribing the whole of the pamphlet alluded to, there being still ample room for "actual observations" on that baneful disease

"Botanists have long known that the blight in corn is occasioned by the growth of a minute parasitic fungus or mushroom on the leaves, stems, and glumes of the living plant. Felice Fontana published, in the year 1767, an elaborate account of this mischievous weed*, with microscopic figures which give a tolerable idea of its form, more modern botanists† have given figures both of corn and of grass affected by it, but have not used high magnifying powers in their researches

"Agriculturists do not appear to have paid, on this head, sufficient attention to the discoveries of their fellow-labourers in the field of nature, for though scarcely any English writer of note on the subject of rural economy has failed to state his opinion of the origin of this evil, no one of them has yet attributed it to the real cause, unless Mr Kirby's excellent papers on some diseases of corn, published in the *Transactions of the Linnean Society*, are considered as agricultural essays

"On this account it has been deemed expedient to offer, to the consideration of farmers, engravings of this destructive plant, made from the drawings of the accurate and ingenious Mr Bauer, botanical painter to His Majesty, accompanied with his explanation, from which it is presumed an attentive reader will be able to form a correct idea of the facts intended to be represented, and a just opinion whether or not they are, as is presumed to be the case, correct and satisfactory



"In order, however, to render Mr Bauer's explanation more easy to be understood, it is necessary to premise, that the striped appearance of the surface of a straw, which may be seen with a common magnifying glass, is caused by alternate longitudinal partitions of the bark, the one imperforate, and the other furnished with one or two rows of pores or mouths, shut in dry, open in wet weather, and well calculated to imbibe fluid whenever the straw is damp Pores or mouths similar to these are placed by nature on the surface of the leaves, branches, and stems of all perfect plants, a provision intended, no doubt, to compensate, in some measure, the want of locomotion in vegetables. A plant cannot when thirsty go to the brook and drink, but it can open innumerable orifices, for the reception of every degree of moisture which either falls in the shape of rain and of dew, or is separated from the mass of fluid always held in solution by the atmosphere, it seldom

---

"* Osservazioni sopra la Ruggine del Grano. Lucca, 1767. 8vo.
"† Sowerby's English Fungi, vol. ii. tab 140. Wheat; tab. 139. Póa aquática.

16704 Hypophyllous deep brown solitary scattered or concentric and subconfluent, Sporidia rather slender with the lower cell attenuated into a short stipes
16705 Hypophyllous minute scattered sometimes confluent irregular in form nearly black, Sporidia short obtuse small with a short stipes
16706 Hypophyll very min scatter deep-brown, Sporidia thick obt variable in shape with lower cell fusiform
16707 Hypophyllous tufts circular depressed broad dark fuscous composed of many smaller ones confluent at the centre, Sporidia oblong with lower cell somewhat attenuated
16708 Hypophyllous purplish black scattered in tufts, Sporidia variable generally very obtuse two rarely 3-celled frequently also divided perpendicularly, Stipes short
16709 Epiphyllous brown eventually black oval often confluent and forming long lines, Sporidia oblong with a white filiform stipes firmly fixed at its base
16710 Tufts dense oblong often confluent and forming long parallel lines changing from yellowish-brown to black, Sporidia elongated the upper cell the shortest, Stipes filiform
16711 Epiphyllous minute scattered nearly black, Sporidia globose with a filiform slender stipes
16712 Scattered reddish-brown round very convex surrounded by the ruptured epidermis, Sporidia oblong 2-celled yellow with a long filiform stem

16710

and Miscellaneous Particulars

happens in the driest season, that the night does not afford some refreshment of this kind, to restore the moisture that has been exhausted by the heats of the preceding day By these pores, which exist also on the leaves and glumes, it is presumed that the seeds of the fungus gain admission, and at the bottom of the hollows to which they lead (*b p*) they germinate and push their minute roots, no doubt (though these have not yet been traced), into the cellular texture beyond the bark, where they draw their nourishment by intercepting the sap that was intended by nature for the nutriment of the grain, the corn, of course, becomes shrivelled in proportion as the fungi are more or less numerous on the plant, and as the kernel only is extracted from the grain, while the cortical part remains undiminished, the proportion of *flour to bran*, in blighted corn, is always reduced in the same degree as the corn is made light Some corn of this year's crop will not yield a stone of flour from a sack of wheat, and it is not impossible, that in some cases the corn has been so completely robbed of its flour by the fungus, that if the proprietor should choose to incur the expense of thrashing and grinding it, bran would be the produce, with scarcely an atom of flour for each grain

"Every species of corn, properly so called, is subject to the blight, but it is observable that spring corn is less damaged by it than winter, and rye less than wheat, probably because it is ripe and cut down before the fungus has had time to increase in any large degree Tull says, 'that white core, or bearded white, which has its straw like a rush full of pith, is less subject to blight than lammas white, which ripens a week later' (See page 74) The spring wheat of Lincolnshire was not in the least shrivelled this year, though the straw was in some degree infected the millers allowed that it was the best sample brought to market. Barley was in some places considerably spotted, but as the whole of the stem of that grain is naturally enveloped in the hose or basis of the leaf, the fungus can in no case gain admittance to the straw, it is, however, to be observed, that barley rises from the flail lighter this year than was expected from the appearance of the crop when gathered in

"Though diligent enquiry was made during the last autumn, no information of importance relative to the origin or the progress of the blight could be obtained this is not to be wondered at, for as no one of the persons applied to have any knowledge of the real cause of the malady, none of them could direct their curiosity in a proper channel Now that its nature and cause have been explained, we may reasonably expect that a few years will produce an interesting collection of facts and observations, and we may hope that some progress will be made towards the very desirable attainment of either a preventive or a cure

"It seems probable that the leaf is first infected in the spring, or early in the summer, before the corn shoots up into straw, and that the fungus is then of an orange colour, after the straw has become yellow, the fungus assumes a deep chocolate brown each individual is so small, that every pore on a straw will produce from twenty to forty fungi, as may be seen in the plates, and every one of these will, no doubt, produce at least one hundred seeds, if then, one of these seeds tillers out into the number of plants that appear at the bottom of a pore (*b p*), how incalculably large must the increase be! A few diseased plants scattered over a field must speedily infect a whole neighbourhood, for the seeds of fungi are not much heavier than air, as every one who has trod upon a ripe puff-ball must have observed, by seeing the dust, among which is its seed, rise up and float on before him

"How long it is before this fungus arises at puberty and scatters its seed in the wind, can only be guessed at by the analogy of others, probably the period of a generation is short, possibly not more than a week in a hot season if so, how frequently in the latter end of the summer must the air be loaded as it were with this animated dust, ready whenever a gentle breeze, accompanied with humidity, shall give the signal, to intrude itself into the pores of thousands of acres of corn Providence, however, careful of the creatures it has created, has benevolently provided against the too extensive multiplication of any species of being, was it otherwise, the minute plants and animals, enemies against which man has the fewest means of defence, would increase to an inordinate extent. This, however, can in no case happen, unless many predisposing causes afford their combined assistance But for this wise and beneficent provision, the plague of slugs, the plague of mice, the plagues of grubs, wireworms, chafers, and many other creatures whose power of multiplying is countless as the sands of the sea, would long before this time have driven mankind and all the larger animals from the face of the earth

"Though all old persons who have concerned themselves in agriculture remember the blight in corn many years, yet some have supposed that of late years it has materially increased, this, however, does not seem to be the case Tull, in his *Horse-hoeing Husbandry*, p 74, tells us that the year 1725 'was a year of blight, the like of which was never before heard of, and which he hopes may never happen again,' yet the average

History, Use, Propagation, Culture, and Miscellaneous Particulars.

price of wheat in the year 1726, when the harvest of 1725 was at market, was only 26*s* 4*d*, and the average of the five years of which it makes the first, 37*s* 7*d*: 1797 was also a year of great blight, the price of wheat, in 1798, was 49*s* 1*d*, and the average of the five years, from 1795 to 1799, 63*s* 5*d*.

"The climate of the British isles is not the only one that is liable to the blight in corn, it happens occasionally in every part of Europe, and probably in all countries where corn is grown. Italy is very subject to it, and the last harvest of Sicily has been materially hurt by it. Specimens received from the colony of New South Wales show that considerable mischief was done to the wheat crop there, in the year 1803, by a parasitic plant very similar to the English one.

"It has been long admitted by farmers, though scarcely credited by botanists, that wheat in the neighbourhood of a barberry bush seldom escapes the blight. The village of Rollesby in Norfolk, where barberries abound and wheat seldom succeeds, is called by the opprobrious appellation of mildew Rollesby. Some observing men have of late attributed this very perplexing effect to the farina of the flowers of the barberry, which is in truth yellow, and resembles in some degree the appearance of the rust, or what is presumed to be the blight in its early state.

"It is, however, notorious to all botanical observers, that the leaves of the barberry are very subject to the attack of a yellow parasitic fungus, larger, but not otherwise different from the rust in corn.

"Is it not more than possible, that the parasitic fungus of the barberry and that of wheat are one and the same species, and that the seed is transferred from the barberry to the corn? Mistletoe, the parasitic plant with which we are the best acquainted, delights most to grow on the apple and hawthorn, but it flourishes occasionally on trees widely differing in their nature from both of these in the Home Park, at Windsor, mistletoe may be seen in abundance on the lime trees planted there in avenues. If this conjecture is well founded, another year will not pass without its being confirmed by the observations of inquisitive and sagacious farmers.

"It would be presumptuous to offer any remedy for a malady, the progress of which is so little understood, conjectures, however, founded on the origin here assigned to it, may be hazarded without offence.

"It is believed, but not dogmatically asserted (because Fontana, the best writer on the subject, asserts that the yellow and dark coloured blight are different species of fungi), to begin early in the spring, and first to appear on the leaves of wheat in the form of rust, or orange-coloured powder, at this season, the fungus will, in all probability, require as many weeks for its progress from infancy to puberty as it does days during the heats of autumn, but a very few plants of wheat thus infected are quite sufficient, if the fungus is permitted to ripen its seed, to spread the malady over a field, or indeed, over a whole parish.

"The chocolate-coloured blight is little observed till the corn is approaching very nearly to ripeness, it appears then in the field in spots, which increase very rapidly in size, and are in calm weather somewhat circular, as if the disease took its origin from a central position.

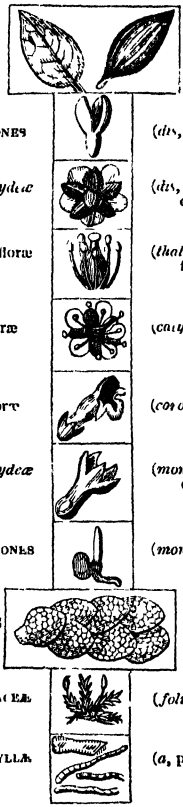
"May it not happen, then, that the fungus is brought into the field in a few stalks of infected straw uncorrupted among the mass of dung laid in the ground at the time of sowing? It must be confessed, however, that the clover leys, on which no dung from the yard was used, were as much infected last autumn as the manure crops. The immense multiplication of the disease in the last season seems however to account for this, as the air was no doubt frequently charged with seed for miles together, and deposited it indiscriminately on all sorts of crops.

"It cannot, however, be an expensive precaution to search diligently in the spring for young plants of wheat infected with the disease, and carefully to extirpate them, as well as all grasses, for several are subject to this or a similar malady, which have the appearance of orange-coloured or black stripes on their leaves, or on their straw, and if experience shall prove that uncorrupted straw can carry the disease with it into the field, it will cost the farmer but little precaution to prevent any mixture of fresh straw from being carried out with his rotten dung to the field.

"In a year like the present, that offers so fair an opportunity, it will be useful to observe attentively whether cattle in the straw yard thrive better or worse on blighted or on healthy straw. That blighted straw, retaining on it the fungi that have robbed the c[illegible] of its flour, has in it more nutritious matter than clean straw which has yielded a crop of plump grain, cannot be doubted, the question is whether this nutriment in the form of fungi does or can be made to agree as well with the stomachs of the animals that consume it, as it would do in that of straw and corn.

"It cannot be improper in this place to remark, that although the seeds of wheat are rendered, by the exhausting power of the fungus, so lean and shrivelled that scarcely any flour fit for the manufacture of bread can be obtained by grinding them, these very seeds will, except, perhaps, in the very worst cases, answer the purpose of seed-corn as well as the fairest and plumpest sample that can be obtained, and in some respects better, for as a bushel of much blighted corn will contain one third at least more grains in number than a bushel of plump corn, three bushels of such corn will go as far in sowing land, as four bushels of large grain. Eighty grains of the most blasted wheat of the last year that could be obtained, were sown in pots in the hot houses, of these, seventy-eight produced healthy plants, a loss of 10 per cent only.

"The use of the flour of corn in furthering the process of vegetation is to nourish the minute plant from the time of its developement till its roots are able to attract food from the manured earth, for this purpose, one tenth of the contents of a grain of good wheat is more than sufficient. The quantity of flour in wheat has been increased by culture and management calculated to improve its qualities for the benefit of mankind, in the same proportion as the pulp of apples and pears has been increased, by the same means, above what is found on the wildings and crabs in the hedges.



"It is customary to set aside or purchase for seed-corn, the boldest and plumpest samples that can be obtained, that is, those that contain the most flour, but this is unnecessary waste of human subsistence, the smallest grains, such as are sifted out before the wheat is carried out to market, and either consumed in the farmer's family or given to his poultry, will be found by experience to answer the purpose of propagating the sort from whence they sprung as effectually as the largest.

"Every ear of wheat is composed of a number of cups placed alternately on each piece of the straw, the lower ones contain, according to circumstances, three or four grains, nearly equal in size, but towards the top of the ear, where the quantity of nutriment is diminished by the more ample supply of those cups that are nearer the root, the third or fourth grain in a cup is frequently defrauded of its proportion, and becomes shrivelled and small. These small grains which are rejected by the miller, because they do not contain flour enough for his purpose, have, nevertheless, an ample abundance for all purposes of vegetation, and as fully partake of the sap, 'or blood, as we should call it in animals,' of the kind which produced them, as the fairest and fullest grain that can be obtained from the bottoms of the lower cups, by the wasteful process of beating the sheaves."

ENCYCLOPÆDIA OF PLANTS.

PART II.

NATURAL ARRANGEMENT.

First grand Division, VASCULARES (*vas*, a vessel, plants with woody fibre and cellular tissue).

First Class, DICOTYLEDONES (*dis*, two, and *cotyledon*, cotyledons two).

Subdivision I. *Dichlamydeæ* (*dis*, two, and *chlamys*, a coat or covering, calyx and corolla distinct)

Subclass 1 Thalamifloræ (*thalamus*, a bed or receptacle, and *flos*, a flower, stamens under the pistillum)

Subclass 2. Calycifloræ (*calyx* and *flos*, stamens on the calyx)

Subclass 3 Corollifloræ (*corolla*, and *flos*, stamens on the corolla).

Subdivision II. *Monochlamydeæ* (*monos*, one, and *chlamys*, a coat or covering, calyx and corolla not distinct)

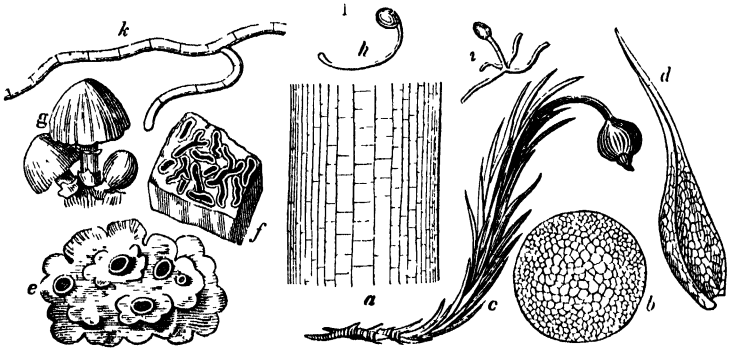
Second Class, MONOCOTYLEDONES (*monos*, one, and *cotyledon*, cotyledon one)

Second grand Division, CELLULARES (*cellula*, a little cell, plants with cellular tissue only)

First Class, FOLIACEÆ (*foliaceus*, leafy, habit).

Second Class, APHYLLÆ (*a*, priv, and *phyllon*, a leaf, leafless)

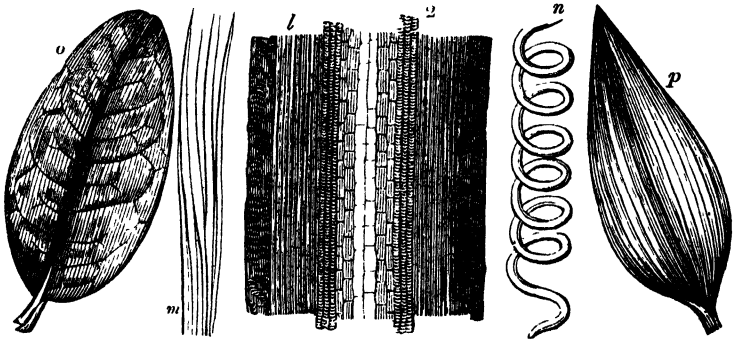
THE difficulties connected with the adoption of the natural system of plants are these, that the characters of many of the orders are at present imperfectly known, and that they depend upon a consideration of many points of structure which are not to be determined without much labor and a considerable degree of practical skill in the use of the microscope and the dissecting knife But the facilities which the habit of viewing all natural bodies with reference to the relations they bear to other bodies, and not as insulated individuals merely possessing certain peculiarities by which they may be referred to some station in an artificial system, ultimately gives to the investigations of the naturalist, are so great, that difficulties of the nature just alluded to ought not to be suffered to influence the botanist in determining which line of study he will follow, whether that pointed out by Linnæus, or that traced by the hand of nature By the artificial system of Linnæus, indeed, no great difficulty exists in determining the number of stamens or styles possessed by a given plant, or the nature of their combination, and from the knowledge so obtained, in referring them to their class and order in the Linnæan system. But when this step has been gained, what more has been acquired than the bare knowledge that the plant in question possesses a certain number of stamens and styles? No possible notion can be formed of the relation it bears to other plants of the same nature, of the qualities it probably possesses, or of the structure of those parts not under examination, the fruit for example, and, finally, if it were wished to convey an idea of the plant to a stranger, no means would be in the possession of the Linnæan botanist of doing so, except by stating that the plant belonged to Pentandria Monogynia for example, which is stating nothing But what would be the condition of the student of the natural affinities of plants in a similar case? It is true he would be obliged to consult more characters than the two unimfluential ones of Linnæus—it would be necessary to ascertain if his subject was Vascular or Cellular, if Vascular, whether it was Monocotyledonous or Dicotyledonous, if Dicotyledonous, whether the leaves were opposite or



alternate, stipulate or exstipulate, whether the flowers were monopetalous, polypetalous, or apetalous, the nature and station of the stamens, the condition of the ovarium, and so on But when he *has* ascertained thus much, only let it be remembered, for a moment, how much he has gained indirectly as well as directly Perhaps he has discovered that his plant belongs to Rubiaceæ, he will then have learned that all vegetables with opposite entire stipulate leaves, and a monopetalous superior corolla, are also Rubiaceous, if a fragment of the leaves and stem only of such a plant were afterwards submitted to him for examination, he would recognise its affinities, and remember that it was Rubiaceous, and being aware of that fact, he would be able safely to infer that its calyx and corolla would be of a particular nature, that if the roots afforded any color for dying, it would be red, that the medicinal properties of the bark, if any, would be tonic, astringent, and febrifugal, and that its seeds would be of the same nature as those of coffee, and finally, its geographical position would be tolerably certain to him

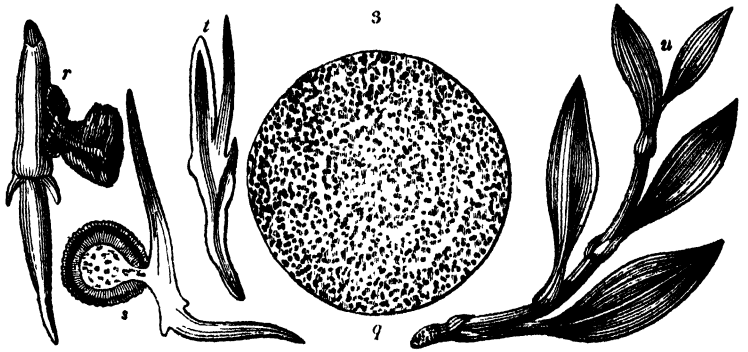
The really important obstacle which exists in the way of acquiring this kind of knowledge, is undoubtedly the want of any introduction to the study of it, accompanied by the distribution and characters of the natural orders into which plants are divided It is to be hoped that English readers at least will not long have to regret this deficiency in their elementary works In this place, it must suffice to point out the characters upon which the great divisions depend, under which the orders themselves are arranged, and it is to be hoped, that even this small aid will be found to smooth the way, and to remove some of the obstacles that at present are supposed to exist at the very threshold of the temple

---



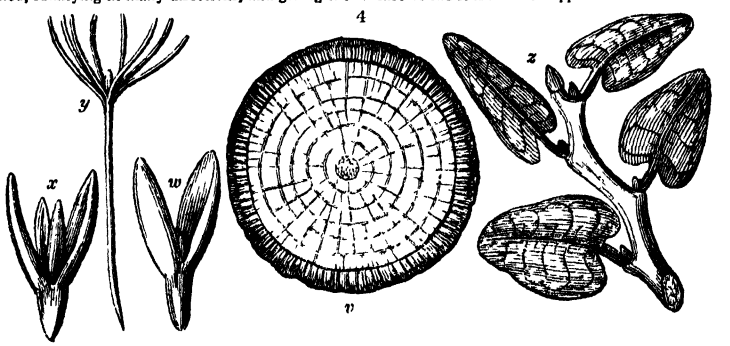
Plants considered with reference to their general structure, are separated into two grand divisions called CELLULARIS and VASCULARES

The Cellulares answer to the Linnæan Cryptogamia, and are also called Acotyledonous, the Vasculares answer to the rest of the Linnæan system, which is sometimes called Phanerogamia and Cotyledonous



a, Longitudinal section of a stem.
b, Transverse section of a stem
c, Stem of a moss, with leaves and theca, or seed-case
d, Leaf of a moss, magnified
e, Leafy thallus of a lichen, with shields
f, Crustaceous thallus of a lichen, with shields
g, Fungi of the highest dignity
h, *i*, Fungi of the lowest rank
k, Conferva magnified

CELLULARES, CRYPTOGAMOUS, or ACOTYLEDONOUS plants are all, therefore, different terms denoting the same combination of vegetables The first term is here adopted in preference to the others as expressing the most obvious character upon which the division depends, namely, the cellular, not vascular, structure of the plants composing it Cellular plants are formed entirely of cellular tissue (*fig* 1), without woody fibre or spiral vessels, or in more familiar terms by having no veins in their leaves if foliaceous, and not forming wood, they also are destitute of perfect flowers The lower tribes, such as Fungi and Algæ, are destitute of leaves, and in some points approach the animal kingdom so nearly as to be scarcely distinguishable In the highest tribe, *Ferns*, apparent veins are formed in the leaves, but as they are imperfectly supplied with spiral vessels, they cannot be considered more than analogous to the veins of other plants Ferns, however, hold the intermediate station between Cellulares and Vasculares, and are chiefly retained among the former on account of their perfect accordance in other respects In the whole of Acotyledones, it is unnecessary to examine the seed for the purpose of determining whether it has one cotyledon, several cotyledons, or none, the structure of the perfect plant giving the most obvious and satisfactory evidence



l, Vertical section of a vascular stem
m, Woody fibre
n, Spiral vessel
o, Leaf of a dicotyledonous plant
p, Leaf of a monocotyledonous plant.

VASCULARES, PHÆNOGAMOUS, or COTYLEDONOUS plants, are also separated into two great classes called Endogenes or Monocotyledones, and Exogenes or Dicotyledones, both which are distinguished as accurately by their obvious physical structure as they are by the minute and obscure peculiarities of the seed They are all formed with cellular tissue, woody fibre, and spiral vessels (*fig* 2), and their leaves are traversed by veins; the last character is sufficient for practical purposes, if it is remembered that they also bear perfect flowers, (that is, flowers furnished either with stamina, or pistillum, or both,) which will always prevent their being confounded with the highest tribes of Cellulares.

q, Transverse section of a monocotyledonous stem.
r, Germination of a monocotyledonous seed
s, Section of ditto, to show the cotyledon remaining in the testa
t, Section of a germinating embryo of a grass, to show the two alternate cotyledons of unequal size, the back and front lobes representing these, the middle lobe is the plumula
u, Stem and leaves of a monocotyledonous plant

Endogenes, or *Monocotyledonous* plants, are the first remove from Cellulares, and hold an intermediate rank between them and *Exogenes* or *Dicotyledonous* plants, in which vegetation acquires its highest form of development They were formerly characterised by having a single cotyledon, but this circumstance is not only not absolute but difficult of determination, except after minute analysis The real difference in the seed of them and Dicotyledones is this, that in Monocotyledones there is only one Cotyledon (*fig* 3 *s*), or, if two, that they are alternate with each other (*t*), while in Dicotyledones they are always opposite, and more than one, sometimes several, as in Pinus (*fig* 4 *y*) The physiological structure of the two classes is, however, that by which they are familiarly distinguished, and exhibits a beautiful proof of the harmony that exists between the great features of vegetation and their first principle, the seed from which they originate In *Endogenes*, or *Monocotyledones*, there is no distinction between wood and bark (*fig* 3 *q*), in *Exogenes*, or *Dicotyledones*, the wood and bark are distinctly separated (*fig* 4 *v*) In Monocotyledones the wood and cellular tissue are mixed together without any distinct annual layers of the former being evident, in Dicotyledones the wood and cellular tissue have each their particular limits assigned them, a distinct layer of the former being annually deposited In Monocotyledones there are no radiations from the medulla to the bark, in Dicotyledones the radiations are distinctly marked In Monocotyledones there is generally no articulation between the leaves and the stem, while in Dicotyledones the leaves are always jointed with the stem from which they fall off, leaving a scar behind In Monocotyledones the veins of the leaf pass in parallel lines from the base to the apex, in Dicotyledones they diverge from the midrib towards the margin at various angles, in the former they are unbranched, the principal veins being connected by nearly simple secondary veins, in the latter they are much branched, ramifying in many directions, and giving the surface of the leaf a netted appearance

v, Transverse section of a dicotyledonous stem
w, An embryo with two cotyledons
x, An embryo with four cotyledons
y, An embryo with many cotyledons
z, Stem and leaves of a dicotyledonous plant

Such are the very obvious distinctions of the two great classes of Phænogamous, or flowering, plants, and so far is it from there being any necessity for dissecting a seed in order to ascertain its structure, that this point is one of the most easy determination, and about which there cannot be in one case in five hundred the slightest cause of doubt or difficulty It is almost impossible to take even a morsel of a plant in the hand without instantly being in possession of the knowledge of the structure of its seed, with respect to the cotyledons.

Thus far have we advanced without a single obstacle to impede us In all farther investigation no greater degree of knowledge or application is requisite than what ought to be possessed by every one who would be able to ascertain the genus of a plant Many of the orders do not depend upon the minute characters of the seed so much as is believed, the structure of the ovarium and position of the ovula, are aids which frequently make amends for the absence of fruit: and the nature of the foliage and inflorescence are guides which, though sometimes treacherous, are often as faithful as the fructification itself But as it is not intended to give the characters of the orders in this place, neither is it necessary to advance farther in an explanation of the manner of determining them, upon that point each order would require a particular note It may, how-

ever, be confidently believed, that there are no greater impediments in the road to an acquaintance with the natural relations of plants than those that have been already removed, and that although neither the science of botany, nor any other science, is to be taken by storm, yet that the fortress is sure to be reduced by silent and patient approach

It only remains to explain briefly upon what principles the names of the orders, suborders, &c are formed It is usual, in the school of Jussieu, to give to a natural order a name derived from that of the genus which is understood to be the type of the order, as Ranunculaceæ from Ranúnculus, Rosaceæ from Rósa, and so on But several deviations from this principle had been admitted by Jussieu, in favor of certain groups of plants, long known by other popular names, derived from certain peculiarities, such as Labiatæ, because their corollas are labiate, Compositæ, because their flowers are what is commonly called compound, Guttiferæ, on account of the resinous juice in which they abound, and some others It would, perhaps, have been better, if uniformity in nomenclature had not thus been sacrificed to a dread of innovation, but it is now too late to remedy the evil, if such it be, nor would the advantage of alteration be at this day equivalent to the inconvenience For the purpose of making it at once apparent, whether, in speaking of a group of plants, reference is had to an order or a suborder, it has of late years been thought convenient to terminate the name of the natural order in *aceæ*, and of the suborder in *eæ* Thus, in speaking of the whole mass of which Ranúnculus is the representative, the word Ranuncul*aceæ* is used, but in speaking of the particular division, or suborder, of which Ranúnculus forms a part, the term Ranuncul*eæ* is employed This manner of speaking is, however, at present, very partial in its application, and is of little importance, except in a few cases, of which Ranunculaceæ is one of the most striking examples In those orders, the titles of which, necessarily, from their grammatical construction, end in *eæ*, as Orchideæ, it is obviously inapplicable, without a total change in a great part of the nomenclature of natural orders, a measure which cannot be too much deprecated.

It may, perhaps, be finally expected, that these remarks should be concluded by a recommendation of some work, from which those who are anxious to become fully acquainted with the principles and distinguishing characters of the Natural System of Botany, may derive the necessary information Unfortunately, however, such a work has at present no existence M Decandolle's Théorie Élémentaire de la Botanique explains the principles upon which the orders of plants are constituted, and M de Jussieu's Genera Plantarum contains their characters, as determined in 1789 but the latter is now too obsolete to be very useful to the tyro In our own language, the only work that can be consulted upon the subject with advantage, is the Flora Scotica of Professor Hooker, in which the characters of the natural orders of Scottish plants are concisely indicated by Mr Lindley We understand a work upon the subject is in preparation by the latter gentleman, by which this great desideratum in the science of Botany will be supplied. It may be expected to appear in the course of 1829, previously to which, however, the division Botany, in the forthcoming Encyclopædia of Natural History will have been published, in which much information may be expected upon this important subject.

I. VASCULARES.

Class I. DICOTYLEDONES.

Subdivision I DICHLAMYDEÆ

This subdivision comprehends all the Dicotyledonous plants, that have both a calyx and corolla, by which they are distinguished from Monochlamydeæ, in which the calyx only exists It is in consequence of this high developement of the floral envelopes, that the greater part of flowering trees and shrubs are found in Dichlamydeæ, it rarely happening that those with a single floral covering only have any brilliant coloring

Subclass I THALAMIFLORÆ.

Petals inserted into the receptacle

The insertion of the petals and stamens into the receptacle is the great character of this subclass, which, therefore, contains all the polyandrous plants of Linnæus, as the Calycifloræ contain the icosandrous genera of the same botanist.

Section 1 *Carpella numerous, or stamens opposite the petals.*

Order I RANUNCULACEÆ.

The greater part of the plants of this order are objects of interest with gardeners, containing, as it does, many of the most elegant or showy of the tribes of hardy plants It is here that the graceful Clématis, the lowly Anemóne, the glittering Ranúnculus, and the gaudy Pæony are found, differing, indeed, in external appearance, but combined by all the essential characters of the fructification It is remarkable, however, that the acrid and venomous properties of these plants are nearly as powerful as their beauty is great They are all caustic, and in many of them the deleterious principle is in dangerous abundance M Decandolle remarks, that its nature is extremely singular, it is so volatile, that, in most cases, simple drying in the air or infusion in water is sufficient to destroy it it is neither acid nor alkaline, but its activity is increased by acids, honey, sugar, wine, or alcohol, and it is, in reality, destructible only by water The crowfoots of our European pastures, and the Anemónes trilobáta and triternáta, of those of South America, are well known poisons of cattle Blistering plasters are made in Iceland of the leaves of Ranúnculus ácris The foliage of some species of Clématis is supposed to afford the means employed by beggars of producing artificial ulcers Some of the Aconites are diuretic, especially Napéllus and Cámmarum Delphinium Consolida is said to be an ingredient in those French cosmetics which are so destructive of the surface of the skin The Helléborus, famous in classical history for its drastic powers, and the Nigélla, celebrated in ancient housewifery for its aromatic seeds, which were used for pepper before that article was discovered, are both comprehended in Ranunculaceæ The range of this order, in a geographical point of view, is very extensive A great number has been discovered in Europe, but they are so abundant in all parts of the world that an order can scarcely be found more universally and equally dispersed It is singular, that, with the exception of the climbing species of Clématis and of Xanthorhíza, scarcely an instance occurs in Ranunculaceæ of a shrubby stem

Tribe 1 Clematideæ.

Clématis *L*

1228 Naravélia *Dec*

Tribe 2 Anemoneæ

1229 Thalictrum *W*
1226 Anemone *W*
1225 Hepática *W en.*
1241 Hydrástis *W*
1231 Knowltónia *Sal*
1230 Adónis *L*

Tribe 3 Ranunculeæ

707 Myosúrus *W*
708 Ceratocéphalus *P S.*
1233 Ranúnculus *W*
1232 Ficária *Pers.*

Tribe 4. Helleboreæ

1239 Cáltha *W*
1234 Tróllius *W*
1286 Eránthis *Sal*
1235 Isopyrum *W*
1237 Helléborus *W*
1239 Cóptis *Sal.*
1053 Garidélla *W.*
1209 Nigélla *W.*
1208 Aquilégia *W.*
1204 Delphínium *W.*
1205 Aconitum *W.*

Tribe 5. PÆONIEÆ.

1164 Actæ'a *Ph.* 1207 Cimicifuga *Ph* 1202 Pæónia *W.* 709 Xanthorhíza *W.*

Order II DILLENIACEÆ.

Fine plants, almost exclusively confined to tropical countries Dillénia speciósa, a native of India, is a most noble tree with large yellow flowers, rivalling those of a Magnólia Hibbértia volúbilis is a green-house plant well known for the beauty of its blossoms, and their powerfully fetid smell The medical properties of this order are scarcely known, a decoction of their leaves or bark is astringent, and used for gargles, and the acid juice of the fruit of some of the species of Dillenia is used in India, mixed with water, as a pleasant beverage in fevers The foliage of many of the species is extremely scabrous, whence the dried leaves are used for the same purposes as fish-skin and sand-paper in Europe, those of Trachytélla áspera are even employed in China for polishing works of metal.

1201 Curatélla *W.* 1206 Trachytélla *Dec.* 1203 Hibbértia *H K.*
1212 Tetrácera *L.* 1214 Dillénia *W* 1211 Colbértia *Sal.*

Order III MAGNOLIACEÆ.

No one is ignorant of the grandeur of Magnolias, or of the delicious, though sometimes dangerous, fragrance of their blossoms, but it is less generally known, that, from their affinity to the trees that produce the famous Winter's bark and Melambo bark, they possess medicinal qualities of no common power The bark of all of them is said to have a bitter flavor without any astringency, and combined with a hot aromatic principle In the United States, the bark of Magnólia glauca and Liriodendron tulipífera, is employed for the same purposes as Jesuit's bark, and from the fruit of Magnólia acuminata, a tincture is prepared which has some reputation for removing attacks of rheumatism The fruit of Illicium anisatum, is the material which flavors the liqueur called Anisette de Bourdeaux The Magnolias are exclusively inhabitants of Asia and America, no species having hitherto been found either in Europe or in Africa

1215 Illicium *W* 1216 Liriodéndron *W* 1217 Magnólia *W* 1218 Michélia *W.*

Order IV ANNONACEÆ

The plants of this order are closely allied to Magnoliaceæ, from which they are principally distinguished by the absence of stipulæ, and by the structure of their anther and seeds The latter consist of a hard mass of albumen, ruminated, as the botanists call it, that is to say, perforated by the substance of the seed-coat, in every direction They are all trees or shrubs, and chiefly inhabitants of the hottest parts of the tropics, but a few have been discovered straggling into the temperate zones of America The fruit of the Annona is in many species highly esteemed as an article for the dessert, especially that of the Cherimoyer, which has the reputation of being the finest fruit in the world, next to the Mangosteen The hard fruits of the species of Uvária are highly aromatic, those of one of them furnish the Piper æthiópicum of the shops The genus Asimina is the only one which contains any hardy species, and these are so delicate as to be seen very rarely in this country In Brazil, the bark of Xylópia sericea is used for cordage, for which it is admirably adapted

1219 Uvária *W* 1221 Artabótrys *R Br* 1223 Asímina *Ad*
1220 Annóna *P &* 1222 Guattéria *R & P* 1224 Xylopia *W.*

Order V MENISPERMEÆ.

The order of Menispermeæ consists entirely of twining shrubs with minute flowers They are extremely dissimilar in habit from the orders which are placed near them, and occupy their present station entirely on account of certain minute but important characters in their fructification With the exception of Schizándra coccínea none of them are worth cultivating as plants of ornament The berries of Lardizabala biternáta are sold in the markets of Chile, under the name of *Agualboqui*, *Gualhogui*, or *Coguil-l ochi*, according to different travellers The bitter, diuretic, and aperient sorts of Pareira brava, are produced by a species of Menispérmum, as is also the famous Columbo root, so much esteemed for its intense bitterness, and for its use in diarrhœa and dysentery The poisonous drug, called Cocculus indicus in the shops, is the seed of Menispérmum Cócculus. Several Brazilian species of Cócculus are said to possess powerful febrifugal properties No species of Menispermeæ is found in Europe, they are chiefly natives of tropical America and Asia.

858 Wendlándia *W.* 2100 Menispérmum *D* 2116 Cissámpelos *Dec.*
1972 Schizándra *W* 2101 Cócculus *Dec*

Order VI BERBERIDEÆ

With the exception of Bérberis this order does not contain any genus of much interest, most of the others are low, inconspicuous, herbaceous plants, Nandina is an elegant Japanese shrub The Berberises are all shrubs of much beauty and interest, especially the species with pinnated leaves, which are sometimes called Mahonias These are all inhabitants either of Europe, Asia, or North and South America, none have ever been seen in Africa or New South Wales Many of the finest species from Chile and India yet remain to be introduced The berries of the Berberises are acid and astringent, the latter quality is especially abundant in the stem and bark

297 Epimédium *W* 826 Caulophyllum *Mich* 829 Bérberis *W*
825 Leóntice *W* 827 Diphyllæa *Mich* 830 Nandina *W.*

Order VII PODOPHYLLACEÆ

Little interesting herbaceous North American plants, nearly related on the one hand to Nymphæaceæ, and, on the other, to the herbaceous genera of Berberideæ Their juice is held to be purgative.

1166 Podophýllum *W* 896 Jeffersónia *Ph*

Order VIII HYDROPELTIDEÆ

This order differs from Nymphæaceæ chiefly in having a definite number of seeds It consists of only two genera, each containing a single species Both are little floating plants of tropical and northern America. Nothing is known of their properties

1240 Hydropéltis *H K*

Order IX NYMPHÆACEÆ.

Like the last, these are all floating plants, and, to gardeners, possessed of great interest, on account of the elegant form and various hues of their flowers Three species are known as the lilies of our own streams and ponds, and the remainder occupy similar stations in other countries Some of the Indian species of Nymphæa are delightfully fragrant The holy Cyamus, or Pythagorean bean of antiquity, is the produce of the Nelumbium, a stately aquatic, which abounds in all the hotter countries of the East, where its roots are frequently used as an article of food The ditches, about Pekin and other Chinese cities, are literally choaked up with its abundance The pericarpia or beans are oblong, hard, smooth bodies, and possess the power of vegetating after having been dried for even thirty years The flowers and roots of the common white Nymphæa have been long celebrated for their sedative and antiaphrodisiacal qualities, which are, however, now considered doubtful In Sweden, in years of scarcity, the roots of Núphar lútea are pounded into cakes along with the inner bark of Pinus sylvéstris

This order has been the cause of much difference among botanists, as to its true station in a natural classification, its structure being of so doubtful a character as to leave room for disputing whether it belongs to Dicotyledones or Monocotyledones Upon this subject M Decandolle has the following remarks · " Gærtner declares that the embryo is undivided, and therefore monocotyledonous In 1802, I remarked in the Bulletin Philomathique, that the embryo both of Nymphæ'a and Núphar is enclosed in a peculiar integument, and that a dicotyledonous structure is apparent when that integument is removed, shortly after, M Mirbel declared that the embryo of Nelúmbium has two thick cotyledones, in 1806, M Turpin gave an accurate description of the fruit of Nelúmbium lúteum, without however removing the doubts about the real structure of the embryo, and two years afterwards his colleague, M Poiteau, described the seed and germination of the same plant, pointing out that the embryo consisted of two thick cotyledons enclosed within a stipular membrane, but destitute of radicula this was subsequently confirmed by M Mirbel after very minute anatomical examination, that observer compared the seed of Nelúmbium to the seed of Amýgdalus, and also to that of Piper and Saurúrus, and also demonstrated that the structure of the stem was analogous to that of exogenous or dicotyledonous plants A very different opinion was shortly afterwards held by M Correa de Serra, an observer of the highest order, who admitted indeed that Nymphæaceæ are exogenous, but contended that the parts which had been taken by previous observers for cotyledons were, in fact, a mere expansion of the radicle, and that cotyledons were as entirely absent in Nelúmbium as in Cúscuta In the meanwhile M de Jussieu adhered to the old opinion, that Nymphæaceæ are monocotyledonous, in which he was supported by the late Professor Louis Claude Richard, a name for ever memorable in the annals of Carpology, who published a new view of their structure, in which he differed materially from all his predecessors, this botanist considered the stipulary membrane of Poiteau a simple cotyledon, and the cotyledons of that writer the hypoblastus, or *body of the radicula*, he also refused to admit any evidence derived from the anatomical structure of the stem In this conflict of opinions, I have determined to station Nymphæaceæ among Exogenes, for the following reasons 1st, because the structure of their stem is that of Exogenes rather than of Endogenes, 2dly, because the two opposite bodies, enclosed within the little bag or stipulary membrane, described by Poiteau, appear to be undoubtedly cotyledons, which is confirmed by the presence of a plumula between them in Nelumbium, 3dly, because of the structure of their flower, which has a great affinity with that of Pæónia, Magnólia, and Papáver, 4thly, on account of the similarity between their fruit and stigma and that of Papáver, 5thly because of their milky juice and convolute leaves, two characters which are not known to exist among Endogenes " Those who are interested in pursuing this curious discussion any farther, will find many remarks and illustrative figures in the English edition of the Analyse du Fruit, published by Mr Lindley in 1819.

1174 Nymphæ'a *W* 1176 Núphar *H K* 1177 Eurýale *H K* 1213 Nelúmbium *J*

Section 2 *Carpella solitary or connate, Placentæ parietal*

Order X PAPAVERACEÆ.

These plants are better known for their medicinal properties than for their beauty. Some of them are the common pests of corn fields, and with grain have been disseminated over all the world Sanguinária is a neat little American plant well known for its crimson juice, and the emetic purgative powers of its roots Saracénnia is a genus of very doubtful affinity, consisting of curious little American marsh plants of difficult culture, and remarkable for the singular pitcher-like form of its leaves The peculiar power of the poppy is, as is well known, narcotic, a property which pervades all the order, although in a less intense degree in all than in the officinal P somniferum, from which exclusively the drug opium is obtained The Mexicans use the expressed oil of the seeds of Argemóne mexicána for polishing furniture

1170 Papáver *W* 1168 Roméria *Med* 1172 Argemóne *W* 1073 Boccónia *W*
1165 Sanguinária *W* 1169 Glaucium *J* 313 Hypécoum *W* ? 1173 Saracénia *W.*
1167 Chelidónium *W* 1171 Meconópsis *Vig*

Order XI FUMARIACEÆ

Tender herbs, with finely cut leaves and annual stems, abounding in a watery juice, without any appearance of milkiness. They are reckoned slightly diaphoretic and aperient, but their medical properties are trifling Formerly they were combined with Papaveraceæ, from which they are now universally distinguished. The greater part of them are natives of hedges or thickets in the cooler parts of the northern hemisphere, two are natives of the Cape of Good Hope Many of the species are beautiful ornaments of the flower-garden

1502 Corýdalis *Vent* 1504 Dicýtra *Dec* 1506 Sarcocápnos *Dec*
1503 Cysticápnos *W en* 1505 Adlumia *Raf* 1507 Fumária *P S*

Order XII CRUCIFERÆ

The importance of this order to mankind, and the singular nature of its botanical characters, render it expedient to speak very fully upon it in which the remarks of the learned M Decandolle, who has paid Cruciferæ particular attention, will be chiefly followed The order consists wholly of annual or perennial, often biennial herbs, occasionally assuming a suffrutescent habit, then, however, never exceeding the height of three feet The roots are either thick and perennial, or annual or biennial and slender, almost always perpendicular and undivided The young roots are tipped with a little sheath, called the coleorhiza, which is produced by the extended ruptured coat of the epidermis when the rootlet first appears This is a curious character, and deserves attention The stems are round or somewhat angular, branched, and often, even in the annual species, indurated at the base The branches proceed from the axille of the leaves, but the uppermost ones are abortive in most cases The racemes are always opposite to the leaves, sometimes the terminal branch is abortive when the raceme appears to be terminal, but this is merely owing to that circumstance The leaves are simple, generally radical or alternate, rarely opposite The flowers are either white, yellow, or purple, or in a few Cape species bright blue The fruit is called either a siliqua or silicula, the former being a linear pod containing many seeds, the latter a roundish pod containing one or very few seeds, whence this order, which is the same as the Linnæan class Tetradynamia, is divided by Linnæus into two parts, called Siliquosæ and Siculosæ In the seed, the radicle and cotyledons are applied to each other in different ways, from which the suborders of M Decandolle derive their characters When the edge of the cotyledons is pressed close to the radicula, so that a cross section would be thus ○ =, the cotyledons are said to be accumbent, as in all Pleurorhizeæ, when the side of the cotyledons is pressed to the radicula thus ○ ||, the former are called incumbent, as in Notorhizeæ If the cotyledons are incumbent, and at the same time half folded together or conduplicate, thus ○ > >, the suborder Orthoplocæ is formed, when the cotyledons are incumbent and spirally twisted, so that a section would resemble this ○ || ||, they constitute the suborder Spirolobeæ, and finally, when the cotyledons are incumbent, and doubled twice in their length, thus ○ || || ||, we have Diplecolobeæ

The whole order is preeminently European, 166 species are found in the north and middle of Europe, and 178 on the sea-shores of the Mediterranean, 45 are found between Mogadore and Alexandria, 184 in the countries of the East, that is to say, Syria, Asia Minor, Tauria, and Persia, 99 in Siberia, 35 in China, Japan, and India, 16 in New Holland and the South Sea islands, 6 in the Mauritius and adjacent countries, 70 at the Cape, 9 in the Canaries, 2 in Saint Helena, 2 in the West Indies, 41 in South America, 48 in North America, 5 in Kamtchatka and the bordering islands, and finally, 35 are common to several parts of the globe From this it appears that there are about 100 species in the southern hemisphere, and about 800 in the northern · or, if they are considered with reference to the zones of temperature, 206 are natives of the frigid zone of the northern hemisphere, 30 of the whole of the tropics, 548 of the temperate zone of the northern hemisphere, and 86 of the southern The forty-first degree of north latitude may be considered the equa-

torial line of Cruciferæ, about half being found on one side of it, and half on the other Their station is very variable; many inhabit open sandy places, some form the vegetation about the limits of the perpetual snows of lofty mountains, and many follow the footsteps of man through all parts of the world

The useful qualities of the turnip, the radish, the rape, and the cabbage, and its multiform varieties, are all well known The greater part of the order consists of plants possessing high antiscorbutic powers These appear to depend upon a certain acrid volatile oily principle, the chemical nature of which is imperfectly known It is particularly abundant in the seeds of mustard and the roots of horseradish, and the leaves of Lepidium latifolium, which latter exercise a violent influence upon the organs of digestion The same sort of acrimony, but in less degree, is found in the herbage of the scurvy-grass and the roots of the radish, which act much more mildly when taken inwardly, thus, when any cruciferous plants are found to be eatable, either from culture or other circumstances, it is to be understood to depend upon a reduction of this acrid principle The exciting powers of this last, are what render the horse-radish, the scurvy grass, and others, so remarkably useful as antiscorbutics; they are also believed to possess diuretic and diaphoretic properties It is to be remarked, that Cruciferæ are always eatable when their texture is succulent and watery, as in the roots of the radish and the turnip, and the leaves of the cabbage tribe A further diminution of the acrid principle is produced by blanching Cruciferæ are said to possess a greater share of azote than any other tribe of plants, as is apparent in their fetid smell when fermented The embryo of all the order abounds in oil, whence many species are employed with much advantage for expressing, either for eating or for feeding lamps Some of the species are extremely beautiful and fragrant, as the Stocks, the Gillyflowers, the Hesperides, the Candytufts, and many others The Hutchinsias, Drabas, Cardamines, &c are among the most interesting of alpine plants

ORDER XIII. FLACOURTIANEÆ.

A very small order formerly comprised in Tiliaceæ It is remarkable on account of the structure of its fruit, to the inner lining of which the seeds are attached upon a branched placenta. Nothing is known of the properties of the Flacourtias The berries of Flacoúrtia Ramóntchi are eaten in Madagascar. The order consists entirely of small tropical trees or bushes

2102 Flacoúrtia *W*

ORDER XIV CAPPARIDEÆ

These are nearly related to Cruciferæ, of the properties of which they partake Many are very pretty plants, especially Cleóme rósea, and the various species of Cratæ'va The common caper is an elegant bush, remarkable for its large white flowers and long purple stamens The species are found occasionally in various parts of the world The different kinds of Cápparis are reputed to be stimulating, antiscorbutic, and aperient The bark of the root of the common caper passes for a diuretic medicine Several species of Cleóme have an acrid taste, which has been compared by travellers to that of mustard The root of Cleóme dodecándra is employed as a vermifuge in the United States, and the leaves produce an inflammation of the skin, whence they are used in Cochin-china as a sinapism *Dec*

1162 Cápparis *W* 1086 Cratæ'va *W* 1448 Cleóme *W*

ORDER XV VIOLARIEÆ.

This is one of the most favorite orders with gardeners, consisting, as it chiefly does, of the Violet genus, from which most of the others are recent dismemberments The greater part are hardy herbaceous plants, some of which are remarkable for their perfume, others for their brilliant colors, and all for their neatness They are natives of the temperate or cold zones of both hemispheres, often growing at great elevations above the sea Among them is a tribe called Alsodineæ, consisting of suffrutescent tropical plants, but none of them have been introduced into the gardens of this country The attention of collectors should be directed to procuring the shrubby Violaceæ of Brazil, some of which possess great interest The medical properties of the order are found principally in their roots, which appear to possess, in all cases, emetic properties, in a greater or less degree One of the Ipecacuanhas is the root of a Brazilian violet M Decandolle has the following observations upon the affinities of the Violarieæ — They are very nearly akin, he observes, to the Polygaleæ and Droseraceæ, and especially to the Passifloreæ From the first they are distinguished by their unilocular fruit, leaves furnished with stipules and two-celled anthers, from Droseraceæ by their solitary style, lengthened embryo and stipulate leaves, the vernation of which is involutive, not circinate From Passifloreæ they differ in their fruit being capsular, not berried, in their albumen being compact and shining, not pitted, in their stamens being hypogynous, not perigynous, in their anthers being attached along their whole length, not fixed by their middle, finally, in their stigmas being one and not three The genus Calyptrion approaches Passifloreæ in its twining stem, and Hymenanthéra borders upon Polygaleæ on account of its monospermous pericarpium with solitary pendulous seeds

541 Ionídium *Vent* 540 Viola *W* 539 Sauvagésia *Jacq.*

ORDER XVI POLYGALEÆ

Most of the plants of this order are interesting, and deserving the attention of the gardener, some for their neatness, some for their beauty, and some for their use in medicine They are natives of most countries, and are either low herbaceous plants, occasionally less than an inch in height (small specimens of Polygala purpúrea), or shrubs varying from a dwarf, rigid, spiny habit, to a tall, graceful, drooping appearance Polygaleæ are remarkable for the union of their stamens into a single body, their one-celled anthers opening with a pore, and their irregular flowers, one of which is often keel-shaped, and beautifully crested or bearded The leaves have generally a bitter astringent taste, which is much more abundant in the roots, combined with an acrid and somewhat resinous flavour these properties are particularly sensible in P sénega, which is reputed a sudorific, diuretic, sialagogue, cathartic, or mild emetic, according to the manner in which it is administered The Yelhoi of South America, the root of a species of Monnina, has the same properties as P sénega, and is particularly used as a remedy for dysentery The well known Rattany, or Ratanhia root, of Chile, is the produce of a plant of this order, and possesses powerful tonic and astringent qualities According to the analysis of a French chemist, it contains gallic acid, but neither tannin nor resin

1508 Polýgala *W* 1509 Muráltia *Neck* 1510 Múndia *Kunth* 1511 Securidáca *L.*

ORDER XVII DROSERACEÆ

The order of sun-dews is a small group of plants, natives of marshes or inundated grounds in all the temperate parts of the world The species are very remarkable for the abundance of glandular hairs with which all the parts of the foliage are covered Only two species are in any degree frutescent The young leaves are always rolled up in the circinate manner, so remarkable in ferns Their medicinal properties appear to be trifling. the leaves have the power of curdling milk

702 Dróscra *W* 1009 Dionæ'a *W*

ORDER XVIII BIXINEÆ

The plants of this order are few in number, and not remarkable either for beauty or use The Bixa orellána is chiefly known for producing the seed called in the shops Arnotta (*Rocou*, Fr), and used for coloring cheese, the properties of the Arnotta are slightly purgative and stomachic They are all bushes or small trees, and mostly tropical. Azaras, Chilian shrubs with fragrant flowers, are not yet known in the gardens of Europe.

1178 Bixa *W* 1179 Prockia *L.*

ORDER XIX CISTINEÆ.

The common rock roses of our gardens give an accurate idea of this order, which contains little else. They are all very ornamental, and particularly well calculated for covering rockwork The species of Cistus and Helianthemum have been multiplied by Dunal in an extravagant manner, as has been well demonstrated by Mr Bentham. They are natives of most parts of the world in dry elevated places. The gum called Ladanum is the produce of some kinds of Cistus, it exhales a fragrant perfume when burnt, and possesses slightly tonic and stomachic properties.

1089 Hudsónia *W.* 1197 Cistus *J* 1198 Helianthemum *J* 222 Lechea *W*

Section 3. *Ovarium solitary Placenta central*

Order XX. CARYOPHYLLEÆ

These consist of herbs or low undershrubs, inhabiting the mountains and pastures of all parts of the world In Europe and Siberia they are particularly abundant, and least so in Africa and South America Many are *common* weeds, as most of the Cerástiums, Spérgulas, and others Several of the Silénes are very ornamental, and among the Arenárias are to be found some dwarf species of considerable elegance But it is in Diánthus that the pride of the order consists this genus is almost unrivalled for the brilliancy of its colors, the neatness of its foliage, and the perfume of its flowers From the finest of its species the title of the order has been derived The virtues of Caryophylleæ are slight Saponária officinális, and one or two others, have been praised for possessing antisyphilitic properties, the root of Siléne virginiána is reputed anthelmintic, and the Arenária peploides, being fermented, is used by the Icelanders for food.

Tribe 1 Sileneæ.

1044 Gypsóphila *W.*	1047 Cucúbalus *L*	1066 Agrostémma *W.*

Order XXI LINEÆ

Separated by M Decandolle from Caryophylleæ, from which it is well distinguished by its fruit having several cells, or in the language of the botanist just named, being formed by the cohesion of several carpella Most of the species are pretty plants, bearing yellow, blue, or white flowers They are of immense importance in the world, on account of the tenacity of their fibre when made into flax The seeds of common flax are between mucilaginous and oily, the leaves of Linum cathárticum and L. selaginoides, the latter a native of Peru, are purgative

701 Linum *W* 321 Radiola *Sm.*

Order XXII TRANKENIACEÆ.

Distinguished from Caryophylleæ by the fruit not having a central separate placenta, but bearing the seeds on the inner margin of the valves The species are natives of arid situations in Europe, Africa, and South America They have not much beauty, and no known medical properties Besides the genus here recorded, there are two others mentioned by M Decandolle

835 Frankénia *W*

Order XXIII MALVACEÆ

Before this order was dismembered of Bombaceæ and Byttneriaceæ, it contained most of the grandest flowers in nature Even now, the splendour of the various species of Malva, Althæ'a, to which the hollyhock belongs, and Hibiscus, renders it one of the most remarkable groups of plants With the exception of the numerous genus Sida, nearly all Malvaceæ are objects worthy of the gardener's care, particularly those which are hardy In stoves or greenhouse, the softness of their branches and leaves render them peculiarly liable to the attacks of the red spider, mealy bug, and scale, from which few collections are free, a circumstance which makes them less generally esteemed than the surpassing beauty of many of them merits The greater part of the order is clothed with stellate pubescence, and a reniform one-celled anther is a character common to the whole These two peculiarities, together with the alternate stipulate leaves, distinguish Malvaceæ from all the rest of Dichlamydeæ All the species abound in a nutritive mucilage, a quality which renders the young heads of the Ochro, or Hibiscus esculéntus, an object of great value within the tropics, as an ingredient in soups In Brazil, the Abútilon esculentum serves the same purposes The emollient properties of Althæ'a officinális, or Guimauve of the French, are well known to physicians, as a remedy for catarrhs and pulmonary complaints A decoction of the leaves of Sphærálcea cisplatina is used for similar objects in Brazil A species of Pavónia is employed in the same country as a diuretic in the form of a decoction The straight shoots of Sida micrántha are employed as rocket-sticks at Rio Janeiro The chewed leaves of Sída carpinifólia allay the inflammation occasioned by the stings of wasps The tough fibres of many Malvaceæ are manufactured into cordage Their petals are astringent, whence those of Hibiscus Rósa sinénsis are used in China to blacken the eyelashes and the leather of shoes The fibrous threads in which the seeds of Gossypium are enveloped furnish the valuable cotton, an article of immense importance to the world, these threads when examined by the microscope, will be seen to be finely toothed, which explains the cause of their adhering together with greater facility than those of Bombax and several Apocineæ, which are destitute of teeth, and which cannot be spun into thread without an admixture of cotton

1473 Kitaibéla *W*	1486 Peréptera *Dec*		

Order XXIV BOMBACEÆ

Distinguished from the last by the imbricate æstivation of the calyx, and the arrangement of the stamens in five sets, or, in Linnæan language, brotherhoods The species are mostly fine trees with large showy flowers, and natives of the tropics Some of them are among the largest trees in the world, Adansónia, the Baobab of Senegal, has been seen with a diameter of twenty-five feet, and specimens of Bómbax Ceíba, and Eriodéndron anfractuósum, are not uncommon an hundred feet in height The wood of all the species is light and soft, as in Malvaceæ, from which this order probably does not differ in its medicinal properties.

1458 Ochróma *W*	1490 Carolinea *W*	1492 Bómbax *W*
1466 Helicteres *W*	1491 Adansónia *W*	1493 Myródia *W.*

Order XXV BYTTNERIACEÆ.

Much the same kind of plants as those of the two last orders, from which they were not formerly distinguished, and from which they scarcely differ, except in their bilocular anthers Many of the Sterculias are fine umbrageous trees, the seeds of which are large and eatable, especially those of the famous Kola, which possess the property, being chewed, of rendering bad water pleasant to the palate The seeds of the Chicha, another and very noble species of the genus, are highly esteemed in Brazil for the dessert. Astrapæ'a, and several other genera related to it, are among the most beautiful in the world The flowers of a species of Pentapétes, called by the Indians, Machucunha, give out a mucilaginous refrigerant juice, which is employed in gonorrhœa Guazúma ulmifolia has its fruit filled with a pleasant mucilage, which is sweet and very agreeable, an extract of the bark of the same plant is used in Martinique to clarify sugar, its old bark is

employed in the form of a strong decoction, as a sudorific Walthéria Douradinha contains a great deal of mucilage, and is employed by the Brazilians as an antisyphilitic.

Tribe 1 STERCULIACEÆ

2036 Stercúlia *W* 2037 Heritiéra *W*

Tribe 2 BYTTNERIEÆ.

1607 Theobróma *W.* 1608 Bubróma *W* 704 Rulingia *R Br* 527 Ayénia *W.*

Tribe 4 HERMANNIACEÆ

1445 Hermánnia *W* 1456 Melóchia *W.* 1454 Walthéria *W*

Tribe 5 DOMBEYACEÆ

1489 Ruízia *W* 1467 Dombéya *J.* 1469 Astrapæ'a *Lindl*
1468 Pentapétes *W* 1457 Melhánia *J* 1470 Pterospérmum *W*

ORDER XXVI TREMANDREÆ

A very small order containing only seven species, all small bushes, natives of New Holland, and remarkable for the peculiar neatness of their appearance In habit, they may be compared to heaths, with which they agree in the anthers bursting by a pore at the end Nothing is known of their properties.

879 Tetrathéca *Sm*

ORDER XXVII TILIACEÆ.

Trees, shrubs, or herbs, in general not remarkable for their beauty, the greater part of the last being the commonest weeds of the tropics. The Lime, from which the order derives its name, is a genus of fine trees with fragrant flowers, and Sparmánnia and Entelèa are handsome broad-leaved greenhouse arborescent plants The inner bark of Tília is tough and separable, and supplies the material whence the Russia mats used by gardeners and others are prepared Córchorus olitórius is cultivated in Egypt as a kitchen-garden vegetable, the fibres of the bark of Córchorus capsulàris are twisted into fishing lines, and the roasted nuts of the Lime tree are reported to bear some resemblance to chocolate

1087 Triumfétta *W* 1181 Apeiba *W* 1184 Muntíngia *W.* 1186 Tília *W*
1100 Heliocárpus *W* 1182 Sparmánnia *W.* 1185 Grèwia *W.* 1187 Córchorus *W.*
1180 Sloánea *W* 1183 Enteléa *R. Br.*

ORDER XXVIII ELÆOCARPEÆ.

These differ from Tiliaceæ in nothing except their lobed petals and anthers opening by two pores at the apex The flowers of some of the species of Elæocárpus are fragrant, the fruit eatable, and the hard rugose stones manufactured into necklaces

1192 Elæocárpus *W.*

ORDER XXIX SAPINDACEÆ

One of the distinctive peculiarities of this order consists in the petals having an additional lobe in the inside, or a tuft of hairs instead Nearly all the plants have compound leaves, and bunches of white flowers, a few of them are twining herbs, but the greater part are trees or shrubs, all natives of the warmer parts of the world, and in a great proportion, of the East The only genus which will bear the climate of England is Kolreutéria, a fine shrub or small tree, with panicles of white or pale yellow flowers Nephélium and Dimocarpus are both genera bearing excellent fruit The rind of the berry of Sapíndus saponária is of a soapy quality, as the name of the plant indicates The pulp of Melicócca, the arillus of Blighia sápida, and the kernel of Berthollétea and Pékea are all excellent eating

926 Sapíndus *W* 832 Ornithrophe *W.* 887 Kolreutéria *W* 925 Cardiospérmum *W*
1971 Nephélium *W* 884 Melicócca *W* 923 Paullínia *W* 897 Dodonæ'a *W*
883 Dimocárpus *W* 885 Blighia *H K* 924 Seriána *W.* 1991 Amiróla *Pers*
831 Cossignia *Juss* 886 Metáiba *Aubl*

ORDER XXX HIPPOCASTANEÆ

The only genus is Æ'sculus, from which some botanists have divided the smooth-fruited species under the name of Pávia The order is much valued for the grandeur of the foliage and flowers of most of the species, which are all hardy trees Their bitter fruit has sometimes been used as a sternutatory, it contains a large quantity of potash, and an abundance of starch. The bark is astringent, bitter, and febrifugal, and has been recommended as a substitute for Cinchona

866 Æ'sculus *W*

ORDER XXXI HIPPOCRATICEÆ.

Little is known of this order The species are tropical arborescent or climbing shrubs, with opposite simple leaves, and small inconspicuous flowers. The genus Tonsélla, of which there is none in cultivation, contains some species known in Sierra Leone as bearing poisonous fruit.

83 Hippocrátea *L.*

ORDER XXXII. MARCGRAAVIACEÆ.

Very curious half-climbing shrubs, all natives of hot countries Some of them bear among the flowers, which are large and showy, singular hollow bodies, like the pitchers of Sarracénia The order has been well illustrated by Professor Hooker, in the 160th article of his Exotic Flora.

1163 Marcgraávia *W*

ORDER XXXIII. ACERINEÆ.

Valuable trees, native of the woods of Europe, Siberia, and North America. Their flowers are in all cases inconspicuous, the breadth and rich color of their leaves constituting their beauty All the larger species abound in a very saccharine sap, from which sugar is prepared in North America, it is chiefly made from A'cer saccharinum and Negúndium, but may be obtained from many others.

2143 A'cer *W* 2144 Negúndium *Dec*

ORDER XXXIV MALPIGHIACEÆ

Undulated unguiculate spreading petals form one of the most obvious characters of this order, the species of which are all tropical, and are either trees or shrubs, often climbers. Many of the Malpighias are well known

for the prurient hairs produced on the surface of their leaves; their fruit is eatable, their timber of a deep red color, and their bark a febrifuge. Their showy pink or yellow flowers, and firm neat foliage, render all this order worthy of cultivation, except Aspicárpa, which is a weed

1054 Malpíghia *W* 1056 Hiræ'a *W.* 1007 Gærtnéra *W*
1055 Banistéria *W* 29 Aspicárpa *Rich*

Order XXXV HYPERICINEÆ.

The whole of these abound in a resinous juice, and are in most cases glandular in some degree. Their leaves are all dotted, and which is very remarkable, the dots are often black, even upon the yellow petals. These latter have a singular obliquity, which is not indicated by their outline, but by the arrangement of their veins. The juice just noticed as abundant in this order is yellow, viscid, rather bitter, often purgative or anthelmintic, and so very analogous to Gamboge, that the juice of Hypéricum baccátum, and some other Guiana species, has received the name of American Gamboge. Most Hypericineæ are bitter, and slightly astringent, whence they have been used as febrifuges. A small part of the order is tropical, but in its most genuine form it consists of herbaceous or undershrubby plants, delighting in the shade of groves and thickets in the cooler parts of Europe and Asia. Nearly all the flowers are yellow, those of H. cochinchinénse are dull red.

1617 Hypéricum *W* 1618 Ascýrum *W.* 694 Parnássia *W*

Order XXXVI GUTTIFERÆ.

Trees or shrubs found in the hottest parts of the world, and well known by their thick entire opposite leaves and resinous juice. In the countries where they grow they are of great importance. One, the Garcinia mangostána, bears a fruit, the equal of which is supposed not to exist. The well known Gamboge is the inspissated juice of Garcinia Gambógia, and, perhaps, other species; the juice of others is found an efficacious vermifuge, and also a remedy for the chiggers, one of the worst pests of equinoctial America. The bark and fruit of many Garcinias are astringent. The unripe fruits of Gri'a cauliflóra are pickled. The flowers of all the order being showy, the foliage good, and the properties interesting, every species deserves cultivation.

1079 Garcinia *W* 1190 Mammæa *W* 2151 Clúsia *W*
1085 Cancúla *W* 1616 Xanthochymus *Roxb* 1188 Gria *W*
1189 Calophýllum *W*

Order XXXVII VINIFERÆ.

The vine is the type and representative of this order. Cissus and Ampelópsis differ little from it in botanical characters, and not at all in habit. The common grape is the only species that bears really good fruit, the American kinds, with large fleshy berries, being spoiled by a disagreeable foxy flavor, which is not found to be removed by cultivation.

501 Vitis *P S* 502 Ampelópsis *W* 505 Cissus *W* 454 Leéa *W*

Order XXXIII GERANIACEÆ.

The Gerániums are well known to all gardeners for their beauty, and the facility with which hybrid varieties are produced among them. Geránium and Erodium are chiefly natives of the northern hemisphere, and Pelargónium of the southern. Different as they appear from Viniferæ in most respects, there are some points in which a curious resemblance may be found between the two orders. The young stems of both are articulated and separable at the articulations, and the lower leaves are opposite, while the upper ones are alternate. In Geraniaceæ no tendrils are produced, but the peduncles are opposite to the leaves, as in Vitis, and occupy the place of tendrils. M. Decandolle observes, that of the true Geraniaceæ, some are slightly acid, especially those of which the leaves and bark are succulent, several exhale a resinous smell which is sometimes agreeable, but occasionally so powerful as to be unpleasant. The resinous principle is so abundant in Geránium spinósum, that its stem burns like a torch, and exhales an agreeable perfume. The most common property of European geraniums is to be astringent, which is chemically determined by their juice being blackened by sulphate of iron, this is particularly remarkable in G. Robertiánum and sanguineum, which are both accounted vulnerary, and in G. moschátum, praténse, and others, in which it is united to a slight aromatic principle, whence they have been recommended for various purposes, and among others for removing calculous disorders. The astringent property of the geraniums is also present in G. maculátum, which grows in much abundance about Philadelphia, the root of this plant, boiled in milk, is used for the cholera in children. Barton is of opinion, that it would be a good substitute for gum kino in nephritus and obstinate diarrhœas.

1460 Eródium *W* 1461 Pelargónium *W* 1463 Geránium *W* 1465 Monsónia *W*

Order XXXIX OXALIDEÆ.

Formerly confounded with the last order. It is the opinion of modern botanists, that the species are more nearly allied to Rutaceæ or Zygophylleæ, and that their character and peculiar habit is quite sufficient to distinguish them. The beauty of the genus Oxalis is very great, and the readiness with which the species may be cultivated and caused to flower, would have been expected to make them universal favorites, they are not however, much seen in cultivation. Their properties are well known, all of them have a slightly acid taste, whence some have occasionally been employed as salad, their acidity is very agreeable and depends upon the presence of a small quantity of oxalate of potassa. In some of the species of equinoctial America oxalic acid exists in great abundance. Several species are employed in Brazil as a remedy for certain fevers of that country.

1064 Biophýtum *Dec* 1065 Oxalis *W* 1058 Averrhóa *W*

Order XL TROPÆOLEÆ.

These are climbing or trailing herbs with handsome solitary axillary flowers, and fleshy stems and leaves. They are distinguished from Geraniaceæ by their stamens being separate, and not agreeing in number with the petals, by their axillary flowers, and fleshy indehiscent fruit. It is very curious, that this is the only order in which the peculiar acrid flavor of Cruciferæ is found to exist. Tropæ'olum pentaphýllum, with probably other species, is a powerful antiscorbutic. All are natives of shady places in various parts of South America. The roots of some are fleshy and eatable.

875 Tropæ'olum *W*

Order XLI BALSAMINEÆ.

The flower of this order has been remarked by a learned botanist to be that of Fumariaceæ, the capsule of Oxalis, the embryo of Linum, and the habit peculiar. The well known elastic spring with which the seeds are ejected, constitutes a principal character of the order. All the species are annuals, with the exception of Impátiens frutéosa, they delight in moist hot situations, generally within the tropics, and are remarkable for the singularity and varied colors of their flowers.

538 Impátiens *W*

Order XLII. ZYGOPHYLLEÆ.

The hardness of the wood of the shrubby species of this order is most remarkable, if the softness of the stems of the herbaceous ones is remembered. To this the extreme difficulty of propagating Guaiacum is to

be attributed Zygophýllum Fabágo is employed as an anthelmintic, but it is in the Guaiacum that the great medical virtues of the order are found all the genus is extremely exciting, the wood and bark of Guaiacum officinále and sánctum have a rather bitter acrid flavor, and are principally used as sudorifics, diaphoretics, or alteratives, they have been found to contain a particular substance differing both from gum and resin, which has been called guayacine Many of the species bear beautiful flowers, especially the Tribuluses, which with their brilliant yellow Cistus-like blossoms, enliven many a barren rock in the tropics. None are found in the colder latitudes of the world

994 Zygophýllum *W.* 995 Fagónia *W.* 996 Tribulus *W* 993 Guaiacum *W.*

Order XLIII. MELIACEÆ

The nearest affinity of this order is probably with Sapindaceæ It is particularly distinguished by the stamens being united into a tube bearing the anthers. The leaves are usually pinnated, and most of the species, which are all either trees or shrubs, are natives of tropical forests Mélia bears bunches of fine lilac colored flowers, but few of the genera are interesting on account of their inflorescence The qualities of the different species are little known Canélla álba is aromatic, and is used in equinoctial America as a spice The bark of Guárea trichiloides is said by Aublet to be purgative and emetic The pulpy fruit of Mélia Azedarách is said to be poisonous, both this part and the inner bark have been used as anthelmintics either in substance or in decoction It is asserted by Michaux, that the pulp that surrounds the kernel is considered in Pekin a specific in scrophulous cases The oil expressed from the seeds of the same plant is said to have strong antispasmodic powers

888 Guárea *W* 988 Mélia *W* 991 Ekebérgia *W*
987 Trichília *W* 989 Quivísia *Cav* 992 Heýnea *Roxb.*

Order XLIV CEDRELEÆ

Some of the finest trees of the tropical regions of the globe are comprehended in this order, as the well known mahogany, and the New Holland cedar, which is a species of Cedréla Their winged seeds distinguish them from Meliaceæ The bark of Cedréla Fúna is employed in the East Indies as a febrifuge, as is also that of the mahogany in the West But the most powerful remedy for fevers in the whole order is the Soymida of the West Indies, which is the produce of Swieténia febrífuga, its taste is bitter and nauseous, and its virtues are extolled as equalling those of Cinchóna

990 Swieténia *W* 531 Cedréla *W.*

Order XLV AURANTIACEÆ

These are also known under the name of *Hesperideæ* They consist of trees or shrubs of the greatest beauty and utility The well-known orange and lemon are the representatives of the order, the characters of which are so well defined that there is no material deviation from the type afforded by those species The thick leaves, articulated with their petiole, and abounding in transparent reservoirs of odoriferous oil, are the most obvious peculiarities The flowers are fragrant, and the fruit in all cases fleshy, and generally eatable The wood is particularly close-grained The volatile oil contained in the reservoirs of the leaves and fruit possesses powerful tonic and stimulating properties M Decandolle thus explains the singular structure of the fruit of the orange In the opinion of this learned botanist it consists, first, of a thick, valveless, indehiscent indusium or coat, which is most likely to be considered a continuous torus Secondly, of several carpella, verticillate around an imaginary axis, often separable without laceration, membranous, and either containing seeds only, or filled with pulp, lying in innumerable little bags proceeding from the inner coats of the cells

500 Triphásia *Lour.* 1004 Glycósmis *Corr* 1005 Murraya *W* 1196 Æ'gle *Corr*
1003 Limónia *W* 1615 Citrus *W* 1006 Coókia *W.* 2149 Feronia *Corr.*

Order XLVI TERNSTROMIACEÆ.

A very small order, consisting wholly of trees or shrubs, bearing handsome white or yellowish flowers They are nearly related to Camellieæ, from which they do not differ at all in habit Nothing is known of their properties Noronha states that a species of Saurauja found in Java has a subacid fruit, in flavor resembling the Tomato, and that it is eaten by the Javanese under the name of Koleho

1083 Eúrya *Th* 1494 Gordónia *W* 1495 Stuártia *W*

Order XLVII CAMELLIEÆ

Camellias are too well known in our gardens to render it necessary to say much upon their peculiarities The Camellia is one of the most beautiful, and the tea one of the most useful, plants in the world Both are natives either of China, Japan, or Nepal The tea is well known for the stimulating influence of its decoction upon the nerves, which is attributed by Cullen to the presence of a narcotic principle The seeds of Camélia oleífera yield a fine oil None of the species bear fragrant flowers Their nearest affinity is with Ternstromiaceæ, from which they probably ought not to be separated

1496 Camélia *Ker*

Order XLVIII OLACINEÆ

Smooth trees or shrubs, with simple stalked exstipulate alternate entire leaves, and little axillary flowers Botanists doubt whether what is called a calyx is not rather an involucrum, in which case the corolla would become a calyx, and the station of the order among Monochlamydeæ, rather than in this place

890 Ximénia *W*

Order XLIX. RUTACEÆ.

An interesting and extensive, but rather heterogeneous, group of plants, natives of all countries and all situations The species are either fetid northern herbaceous plants, as the garden rue, or neat heath-like southern shrubs, with an aromatic odor, as the Cape Diósmas, broad or long-leaved Australasian shrubs, with a stellate pubescence, as Phebálium, or tropical trees with panicles of pallid minute flowers, as the Cuspárias and Xanthóxylums The order contains nearly 500 species, of which but a small proportion is in our gardens The medical properties of many genera are considerable Rúta and Péganum are eminenagogue, anthelmintic, and sudorific. Diósma abounds in a volatile oil of an agreeable smell, but acrid flavor, several of its species are reputed antispasmodics The Xanthoxylums are said to possess acrid, stimulating, or tonic qualities, Cláva Hérculis and fraxíneum are said, in America, to be powerful sudorifics and diaphoretics According to Barton, they possess a remarkable power of exciting copious salivation, not only when applied to the mouth, but even when taken internally, they have both been found powerful remedies in paralysis of the muscles of the mouth Xanthóxylum caribæ'um is regarded in Guiana as a detersive vulnerary and febrifuge The famous febrifugal Angostura bark is the produce of Cuspária febrífuga.

Tribe 1 Ruteæ.

998 Ráta *W* 1088 Péganum *W* 1293 Melánthus *W* 905 Jambolifera

Tribe 2 DIOSMEÆ.

Tribe 3 ZANTHOXYLEÆ.

303 Fagára *W* 2066 Xanthóxylum *W*

Tribe 4 CUSPARIEÆ.

41 Galipéa *Aubl.* 1500 Monniéria *W.*

ORDER L. CORIARIEÆ

Five species constitute the whole of this order, distributed in South Europe, New Zealand, Peru, and Mexico They possess no beauty, and are only interesting on account of their problematical station in a botanical arrangement The leaves of C myrtifólia are astringent, and are employed in dying black Its berries are very poisonous On one occasion, during the Spanish war fifteen French soldiers were taken ill after eating them, and three died from their powerful narcotic effects.

2091 Coriária *W*

Section 4 *Fruit (gynobasic) inserted into a fleshy receptacle, with which the style is continuous.*

ORDER LI OCHNACEÆ

Beautiful yellow-flowered tropical shrubs or trees with lucid leaves The roots and leaves of Walkéra serráta, a Cingalese plant, are bitter, a decoction of them, either in water or milk, is used in Malabar as tonic, stomachic, and antiemetic The bark of Gomphia hexasperma is found useful in healing sores produced in cattle in Brazil by the stings of insects

1001 Gómphia *W* 1101 Ochna *W*

ORDER LII SIMARUBACEÆ

Thirteen plants, found in equinoctial America, constitute this order They are trees or shrubs, with an intensely bitter bark, a milky juice, and pinnated leaves The Quassia is well known as the most pure and intense bitter hitherto discovered, the same property exists, in a milder degree, in the rest of the order Quássia amára is a very ornamental plant, but rare, at present, in collections

1002 Quássia *W*

SUBCLASS II CALYCIFLOREÆ

Petals separate, inserted into the calyx

ORDER LIII CELASTRINEÆ

This order differs from the succeeding, in having the stamens alternate with the petals, the sepals imbricated in æstivation, and the ovarium wholly superior It consists entirely of shrubs or small trees, with simple, rarely compound, alternate or opposite leaves, and inconspicuous flowers of a greenish or white color Several are favorite ornaments of our shrubberies, as the Staphyléa, the Celástrus, and the Euónymus, the latter of which is valued on account of its beautiful-colored fruit The fruit of Euónymus europæus is a brisk purgative, as is also the inner bark, and in strong doses powerfully emetic The famous Paraguay tea is the foliage of a species of Ilex The bark of Prinos verticillátus possesses such active, astringent, bitter, tonic, and febrifugal qualities, that it is used in North America, with success, as a substitute for Cinchóna A decoction of the twigs of Maytenus boária is used to bathe the swellings produced by the poisonous shade of the tree Lithi

Tribe 1 STAPHYLEACEÆ

301 Hartógia *W* 314 Mygínda *W* 543 Plectrónia *W*
300 Curtísia *W* 315 Ilex *W* 514 Schrebéra *Retz*

ORDER LIV RHAMNEÆ

In habit, this altogether agrees with the last, from which the medical properties of the species are not widely different Throughout the order, as far as it has been examined, there is a remarkable agreement between the fruit and the inner bark, especially in Rhámnus catháricus, frangula, and others, in which they both are purgative and emetic Some, as the Jujuba, and the African Lote, nevertheless, yield a wholesome and agreeable fruit, and the berries, of the greater number, yield, under the chemist's hands, green or yellow dyes of much importance in manufactures The leaves of Rhámnus theézans are substituted for tea by the poorer sort among the Chinese The bark of Ceanóthus cæruleus is esteemed in Mexico as a good febrifuge

506 Zizyphus *W.* 503 Rhámnus *W* 542 Phylica *W* 532 Hovénia *Th.*
505 Paliúrus *Gært* 510 Ceanóthus *W* 2146 Gouánia *W* 2060 Schæffèria *W*
504 Œnópia *Mich.* 512 Pomadérris *W*

ORDER LV BRUNIACEÆ

Small heath like shrubs, all natives of the Cape of Good Hope, and extremely ornamental, both in flower and foliage Their properties are unknown

533 Brúnia *W* 511 Stáavia *W*

ORDER LVI SAMYDEÆ

Tropical shrubs or small trees, with entire, stipulate, alternate leaves, covered with pellucid dots, and axillary flowers of little show Some of the species of Samyda are pretty, but very rare Their properties are unknown M Decandolle remarks, that in their fruit they approach Bixineæ and Flacourtianeæ, but on account of the position of their stamens must be arranged in the vicinity of Rhamneæ and Rosaceæ

1034 Samyda *W*

Order LVII. HOMALINEÆ.

Evergreen handsome shrubs, with alternate leaves and deciduous stipulæ, they are readily known by their parietal placentæ, an unusual character among the orders that surround them Blackwéllia fagifólia has fine bunches of starry white fragrant flowers Aristotélia is an evergreen half hardy shrub, with eatable berries Little is known of their medical properties, the root of Homálium Racoúbea is used in Guiana as a cure for gonorrhœa

1108 Blackwéllia *Juss.* 873 Astránthus *L.* 1084 Aristotélia *W*

Order LVIII TEREBINTHACEÆ.

This order is, notwithstanding the labors of several botanists, in a very confused state, from want of sufficient knowledge of many of the genera, which have been hitherto imperfectly described, it is difficult either to determine the value of the characters assigned to the tribes, or the dignity of the tribes themselves. All the species are shrubs or trees, with alternate exstipulate leaves, and inconspicuous flowers, and abound in a balsamiferous resin, which is chiefly present in the leaves and bark, and from which the denomination of the order has been derived Notwithstanding the minuteness of their flowers, many of the species are valuable as ornamental plants, on account of the beauty of their foliage, others for the sake of their utility in arts or medicine, and others for their fruit The walnut, the Cashew nut, and the Pistachio are valuable for their nuts, which are well known articles of the markets of Europe The Spóndias and Mángo are equally famous in the tropics The well-known balsam of Tolu is the produce of the Toluifera, the balsam of Mecca, of the Amýris gileadensis, and balm of Acouchi, of the Icica acuchini, gum comes from Amýris elemifera and Icica leptophýlla, mastich from Pistácia atlántica and lentiscus, and Venetian turpentine from Pistácia terebínthus Schinus Mólle produces a resin which in Peru is used as a dentrifice, as myrrh is with us Some of the best varnishes are prepared from the exudation of Amýris guianénsis, Rhús vérnix, copallína, and others, the finest kinds of incense are also afforded by plants of this order, such as the wood and resin of the different species of Icica, of Amýris balsamífera, and of Canárium commúne, the Coumia, which is used in Guiana for such purposes, and finally, the Boswellia thurífera, which is the true frankincense of Indian temples But among the fragrant and wholesome plants of which the order chiefly consists, he concealed others in which acrid and poisonous qualities no less abound Such are several pieces of Rhus, the juice of which produces blisters upon the skin, and the Amýris toxífera, the juice of which is accounted poisonous To conclude this long list of the uses and dangers of Terebinthaceæ, the bark of Brúcea is used as an astringent in dysenteries, that of Rhus glábra as a febrifuge and as a mordant for red colors, and that of Rhus coriária as a powerful means of tanning skins of animals It is curious to remark how strongly Terebinthaceæ are connected with Amentaceæ through Júglans

1999 Juglans *W*

Order LIX LEGUMINOSÆ

The family to which the various kinds of pulse belong is one of the most familiar to the world, and at the same time one of the most useful to mankind Their papilionaceous flowers characterise a large number, and their pods and pinnate leaves the remainder, with a few exceptions, which it is not necessary to particularise As objects of ornament, many are possessed of unrivalled beauty, for example, among hardy flowering trees, the Robinia and the Labúrnum, among shrubs, for decorating the borders of the flower-garden, the various tribes of Cýtisus, Caragána, Colutèa, Amórpha, and others, among hardy climbers, the far famed Glýcine of China, and its sister of North America, with the species of the herbaceous genera Vícia and Láthyrus, and, lastly, among hardy herbaceous plants, the numerous species of Lupínus and Astrágalus Great, however, as is the beauty of the Leguminosæ which can brave the inclemencies of the seasons of Northern Europe, it must give way before the splendor and elegance of their brethren of the tropics The flowers of the Erythrina, or Coral tree, are of the deepest crimson, and borne in profusion upon some of the loftiest trees of the forest The Bauhínias, with their snake-like stems and twin leaves, hang in festoons of flowers from branch to branch of other trees, and are only rivalled by the less vigorous and elegant, but more richly colored blossoms of the Carpopógons But all these, with their broad heavy foliage and gaudy colors, are far surpassed by the rugged trunks, trembling airy foliage, and golden flowers of the Mimósa, which cast a charm over even the most sterile deserts of burning Africa While the forests of hot countries are thus indebted to species of this order for their timber, the meadows and pastures of the same latitudes are enamelled with the flowers of myriads of Hedýsarums, and animated by the wonderful motion of sensitive plants As in our own country, the gayest part of our scenery is in many places indebted to the yellow flowers of our furze and broom, so in other countries the same effect is produced by other genera of Leguminosæ, by Lupária, Borbónia, and Aspálathus, at the Cape of Good Hope, and by the Pultenæ'as, Daviésias, Aótuses, and multitudes of similar genera in New Holland The wood of the order is very hard and durable, with a yellow tinge, sometimes changing into green, as in the Labúrnum of Europe, and in the better known Brazil wood of commerce, produced by Cæsalpínia The following useful remarks upon the properties of the order are made by M Decandolle —

"The family of leguminous plants, though established upon characters of primary importance, offers, nevertheless, so large a number of species and such singular botanical anomalies, that it is easy to foresee that its properties will exhibit little uniformity Still more exceptions may be anticipated if one reflects, that the chemical principle which is found most abundantly in every part of leguminous plants, and to which we must attribute their principal properties, is the extractive It is probable that this principle, either from its own nature, or from its peculiar power of uniting with different matters, or perhaps instead of being a simple principle, it is rather a compound of different matters, it is probable, I say, that the extractive principle exhibits

much less uniformity in its results than any other. It is, without doubt, to the presence of the extractive principle, in considerable quantities, that many leguminous plants owe their purgative properties, which are common to several extracts, and which many chemists attribute to the acetate of potash, which they are almost universally found to contain Thus the leaves and foliaceous pods of Cássia sénna *Lin.*, of Cássia lanceoláta *Forsk*, of Cássia emarginàta of the Antilles, of the Cássia marylándica employed in the United States, of Colùtea arboréscens, of Spártium púrgans, and perhaps also of Coronilla émerus, act as brisk purgatives, and often cause wind and pain in the bowels The juice of Coronilla vária excites vomiting, and may even become poisonous when taken in too large quantities It is, perhaps, from a different cause that the pulp which is contained in the husks of leguminous plants operates upon the human body, it purges gently without causing the least pain, and ought to be considered as laxative rather than purgative. Such is the character of the juicy pulp that exists in the Cássia fistula *Lin*, in the Tamarindus indica *Lin*, in the Ceratónia siliqua *Lin*, and probably in the Mimósa inga and the M fagifólia, which are eaten in small quantities in the Antilles, but which, taken more copiously, would have the same effect as our Carobs There are some fruits of Leguminosæ, for example, the Sophóra and the Gleditschia, with tumid pods, in which is found a juice which surrounds, it is true, the seeds, as in the plants just mentioned, but which differs from them altogether in its very astringent and nauseous flavor, the nature and properties of this juice deserve to be examined by chemists, and would undoubtedly throw some light upon the nature of Leguminosæ I am induced to think, that the astringent juice of the Sophóra is a secretion of the pericarp, whilst the sweet and purgative juice of the Cássia would be a secretion of the external part of the seed, but this hypothesis requires to be verified what leads me to this opinion, is the flavor commonly found in husks, in the Carobs, for example, the husk is astringent, and the pulp sweet and laxative But let us return to the properties which may be attributed to the extractive principle It is undoubtedly from some one of these modifications that the singular property of the Piscídia and many Galégas is derived, which are employed in America to stupefy fish, which are taken by this means as readily as with Nux vómica The decoction of the root of Galéga virginiána is considered in America as a powerful vermifuge It is, perhaps, indeed, to the very same cause that the rubefacient powers of the fresh leaves of some Leguminosæ are to be ascribed, which act readily upon the skin if applied as plasters, as, for example, in Ornithopus scorpioídes among ourselves, and Hyperanthera moringa elsewhere It appears to me, that it is to the greater or less considerable mixture of the extractive principle with the fæcula contained in the seed, that the different properties of the pulse of leguminous plants may be attributed. If found in small quantities, the seed may serve as food for man and animals, as we see in French beans, peas, lentils, chick peas, beans, and many others, &c If found in a more considerable quantity, it will render them purgative or emetic, as in the Cytísus labúrnum, the Anagýris fœtida, and even in most Coronillas It is remarkable that the botanical characters of Leguminosæ should so strictly agree with the properties of their seeds the latter may be divided into two sections, namely, first, those of which the cotyledons are thick and filled with fæcula, and destitute of cortical pores, and which, moreover, in germination do not undergo any change, but nourish the young plant by means of that supply of food which they already contain, secondly, those of which the cotyledons are thin, with very little fæcula, and furnished with cortical pores, and which change at once into leaves at the time of germination for the purpose of elaborating food for the young plant. All the seeds of the first section are employed as food in different countries, none of those of the second section are ever so employed, the Cajan, which has long been classed among the Cytísi, was apparently an exception to this general rule, but observation has proved the contrary Bearing in mind its known properties, I formerly paid particular attention to its structure, and I have shown in a note which accompanies my catalogue of the Montpelier garden, that the Cajan forms a particular genus much more nearly allied to the French bean than to the Cytísi, and that it, in fact, belongs to the first of the sections which I have just described. The seeds of Leguminosæ present also many other anomalies more difficult to reduce to any fixed laws thus some are found which contain a rather large portion of fixed oil, such as the seed of the Arachis hypogæa, lately introduced into European agriculture, and that of Guilandina moringa which produces oil of ben, there are some, of which the flavor and smell are rather powerful, as the seed of Dipterix or Coumaroúna odóra of Aublet, which, under the name of Tonquin bean, is used for perfuming snuff, there are others which, like the chick pea, have rather a bitter taste and exciting properties, and are on that account administered for the jaundice There are others again, like those of the Andira, which are so bitter as to be used in Java and Brazil as tonic, alexiteric, and vermifuge In a word, are not the aperient and diuretic properties which are observable in the herbage and the roots of many leguminous plants, such as broom, beans, Onónis, Guilandina ringa and moringa, Anthyllis crética, &c to be attributed to a modification of this extractive principle? There are, in another view, roots which are furnished with tubercles, that is to say, with reservoirs of fæcula which furnish mankind with wholesome food, as we see in the Láthyrus tuberósus, which is eaten in Holland, the Dólichos tuberósus, and the D bulbósus, which the Indians use as food The roots of the liquorice have a sweet and mucilaginous taste, which is well known by every body, and which, united to an acrid and rather exciting principle, causes it to be employed as a pectoral, the analysis of this root, published by M Robiquet, proves that independently of its woody skeleton, the same kind of amylaceous fæcula is found as in the tuberous roots of which we have just been speaking, it is thence seen that the acrid flavor of decoctions of liquorice depends on the small quantity of resinous oil which it contains, and that its sweet properties are by no means analogous to common sugar, since it is insoluble in cold water, soluble in warm water or in alcohol, not capable of fermentation, and does not yield to the action of nitric acid any of the known products of sugar It may here be added, that the sugary flavor of liquorice, and its other properties, are not confined to this genus, they are found equally in the roots of Tritolium alpínum, vulgarly called Mountain liquorice, in those of the Abrus precatórius, from which a pectoral draught is prepared in Hindoostan, called Velti, and in others The barks of some trees of the leguminous class, are remarkable for their bitterness, and are used as febrifuges, the different kinds of Geoffróya possess this bitter and febrifugal quality in a remarkable degree, in India, the bark of the Æschynómene grandiflóra and of the Cæsalpínia bonducélla are employed for the same purpose The barks of many leguminous plants are also remarkable for their astringent qualities, caused by the quantity of tannin which they are found to contain, this is observable in the Acácia Cátechu, and in the Acácia arábica, which is used for tanning leather, and elsewhere It is well known that almost all coloring matter proceeds from the extractive principle, and as it appears that this principle abounds in Leguminosæ, we ought to find in them a considerable number of the colors which are used by dyers: to this family, in fact, belong the principal blue colors, known by the name of indigo, extracted from every kind of Indigófera and from some Galégas, and the red colors, which are yielded by all the species of Cæsalpínia and of Hæmatóxylon We may add the red juice, which is drawn from the Pterocárpus dráco and Santalinus, under the name of sandal and of dragon's-blood, from Erythrina monospérma, under the name of gum lac; and also from Dalbérgia monetária These juices appear to differ in many particulars, but their history and analysis are at present so far from being known, that it is impossible to form a true estimate of the nature of their differences. But anomalies of this nature are far from being confined to the plants just mentioned Among the exotic drugs employed in the arts they are very common such, for example, are the balsam of Capivi, produced by the Copaífera, the balsam of Peru, which, Mutis says, is obtained from Myróxylon, the Cachou, which has been found to be almost pure tannin, and which is supposed to be produced by Acácia Cátechu, of the same character is that remarkable resin that is yielded by Hymenæa Courbaril, gum Arabic, produced by the bark and roots of Acácia senegalénsis, nilótica, arábica, and others; gum tragacanth obtained from Astrágalus créticus, gummífera, and vérus, and finally, *manna*, secreted by Hedýsarum alhági"

The arrangement of this tribe of plants has been found to be attended with much difficulty By Linnæus, and the writers who succeeded him, the number of genera was much smaller than those admitted by botanists of the present age, many additions have been made in consequence of the discovery of New Holland, and a large number of subdivisions in old genera have been from time to time introduced by one writer or another To combine these scattered improvements under one uniform system has lately been attempted by the learned botanist, from whom the foregoing extract has been taken This was not executed at the time when those parts of the present work, in which leguminous plants are found, were written, for which reason the names

of the suborders will not be found in the body of the work. M Decandolle's method, however, being here adopted, it will be useful to explain the principles upon which it is founded. He divides Leguminosæ into two grand divisions, the first of which consists of plants, the radicle of whose seed is curved back upon the edge of the cotyledons, and the second of those whose radicle and cotyledons are straight: the former are CURVEMBRIÆ, the latter RECTEMBRIÆ. In the *Curvembriæ*, certain diversities in the structure of the calyx and corolla again divide into two principal forms, one of which, comprehending all the genera with papilionaceous flowers, is called Papilionaceæ, and the other, consisting of a very small number of species, with one or two petals or more, and an obscurely lobed calyx, is called Swartzieæ. The last is not subdivided, but the Papilionaceæ resolve themselves into the two great tribes pointed out by M Decandolle, namely, those with fleshy cotyledons and eatable pulse, *Sarcolobæ*, and those with foliaceous cotyledons and seeds which are not eatable, *Phyllolobæ*. Each of these is divisible by three, upon slight differences in the fructification. In *Rectembriæ* two suborders, Mimoseæ and Cæsalpineæ, are formed upon variations in the æstivation of the calyx and corolla; in the former, it is valvate, in the latter, imbricated; the first constitute a single tribe, the latter divide into three, distinguished by less momentous peculiarities of structure. Having premised thus much, the following tabular explanation will be intelligible:

I CURVEMBRIÆ
- PAPILIONACEÆ.
  - *a.* Phyllolobæ
    - Tribe 1 *Sophoreæ*. Pod continuous. Stamens distinct.
    - Tribe 2. *Loteæ*. Pod continuous. Stamens united by the filaments.
    - Tribe 3. *Hedysareæ*. Pod with transverse articulations. Stamens mostly united by the filaments.
  - *b* Sarcolobæ
    - Tribe 4 *Viciæ*. Pod polyspermous, dehiscent. Leaves cirrhous, the first alternate.
    - Tribe 5 *Phaseoleæ*. Pod polyspermous, dehiscent. Leaves not cirrhous, the first opposite.
    - Tribe 6 *Dalbergieæ*. Pod one or two-seeded, indehiscent. Leaves not cirrhous.
- 2. SWARTZIEÆ. Tribe 7. *Swartzieæ*

II RECTEMBRIEÆ.
- 1 MIMOSEÆ. Tribe 8 *Mimoseæ*
- 2. CÆSALPINEÆ
  - Tribe 9. *Geoffreæ*. Sepals and petals imbricated in æstivation. Stamens variously connected by the filaments.
  - Tribe 10 *Cassieæ*. Sepals and petals imbricated in æstivation. Stamens distinct.
  - Tribe 11. *Detarieæ*. Sepals before expansion indistinct, calyx bladder-like. Petals 0.

SUBORDER I. *PAPILIONACEÆ*

Tribe 1 SOPHOREÆ

941 Sophóra *H K.*
940 Edwárdsia *Sal*
942 Ormósia *Jacks*
945 Virgília *Lam*

980 Hyperanthéra *W.*

ORDER LX ROSACEÆ.

With the exception of Chrysobalanæ and Sanguisorbeæ, this order is so uniform in its appearance, that Rósa, the type from which all the other genera are to be considered variations, when justly understood, will be found to contain every form of structure which is essential to the order Having stated this, it will be at once obvious, that if the other genera have such close affinity to Rósa, they must also bear a great analogy in beauty And this is, indeed, the fact Amygdalus and Prúnus among trees, and Potentilla, Géum, and others, among herbaceous genera, rival the rose in their blossoms, and, in many particulars, surpass that most lovely of all flowers in foliage and general appearance But it is not for charms alone of smell, or blossom, or foliage, that this order has fixed itself so high in the estimation of mankind It has also the rare merit of comprehending all the most important of the fruits of the temperate regions of the world Thus the apple and the pear belong to Pyrus, the plum and the apricot to Prúnus, the peach and the nectarine to Amygdalus, Eriobótrya produces the loquat, Méspilus the medlar, and finally, the quince is borne by the Cydonia The medical powers of many plants of this order are not less active than their fruit is excellent The principal of these is the well-known Prussic acid, which exists in abundance in the leaves and kernels of many genera, especially of Prúnus and Amygdalus it is the basis of Laurel water, which, when taken in small doses, acts either as a violent purgative or as an emetic, and, in stronger doses, is said to destroy irritability without exciting inflammation; these properties, however, although thus dangerous in the distilled water of the laurel and other similar plants, can scarcely be said to exist in any important quantity in the plants in a state of nature The kernel of the bitter almond, for example, in which the Prussic acid is more abundant than usual, is used for many culinary and other purposes without any bad effect There are, however, cases in which it is said to be dangerous to eat the fresh leaves or kernels, as in the Prúnus virginiána, the leaves and fruit of which are reputed in the United States to be poisonous to certain animals Besides the Prussic acid, there are several other principles which abound in the order All Drupaceæ yield a gum which is nearly allied to gum Arabic, and which affords a strong evidence of the affinity that exists between Rosaceæ and Leguminosæ A great deal of astringency is found in many species, whence different parts have been occasionally employed as febrifuges, and as remedies for hæmorrhage, diarrhœa, and dysentery The root of the Tormentilla is used for tanning in the Ferro Isles, and that of the Capollin cherry in Mexico The bark of Prúnus virginiána is used as a febrifuge in the United States, Potentilla réptans has been praised for the same properties The root of Géum urbánum has been found, by Milandi and Moretti, to contain one eleventh of its weight of tannin, it has been used both in America and Europe as a substitute for Jesuit's bark The leaves of Dryas octopétala in the north of Europe, of Rúbus árcticus in Norway, of Prúnus spinósa and ávium, and of Rósa rubiginósa have been manufactured into a sort of substitute for tea The bark of the root of Gillénia trifoliáta is remarkable in having, in addition to the astringency already mentioned, an emetic property, on which account it is employed in North America as Ipecacuanha. It is said, that a similar power exists in other Spiræas

It must not be omitted, that the order Rosaceæ nearly answers to the Icosandria of Linnæus.

Tribe 1 CHRYSOBALANEÆ

1130 Chrysobálanus *W* 870 Parinárium *Juss.* 499 Hirtélla *W* 1080 Grangéria *Lam.*

Tribe 2. AMYGDALINEÆ.

1128 Amygdalus *W* 1129 Prúnus *W*

Tribe 3. SPIRÆACEÆ

1156 Kérria *Dec.* 1141 Spiræ'a *W.* 1142 Gillénia *Mönch.*

Tribe 4. NEURADEÆ.

1063 Grielum *W.*

Tribe 5. DRYADEÆ.

1159 Dryas *W* 1140 Waldsteinia *W* 1154 Tormentilla *L* 1101 Agrimónia *W.*
1161 Sievérsia *W* 1149 Rúbus *W* 1153 Potentilla *L* 1152 Comárum *W.*
1155 Géum *W* 1150 Dalibárda *Mich* 710 Sibbáldia *W.*
1160 Colúria *R Br* 1151 Fragária *W.*

Tribe 6. SANGUISORBEÆ.

255 Alchemilla *W* 1190 Potérium *W* 68 Ancistrum *L.*
256 Sanguisórba *W* 2106 Cliffórtia *W.*

Tribe 7. ROSEÆ.

1148 Rósa *W*

Tribe 8 POMACEÆ.

1132 Cratæ'gus *L.* 1137 Eriobótrya *Lindl* 1131 Méspilus *Lindl*
1136 Raphiolépis *Lindl.* 1139 Cotonéaster *Lindl* 1133 Pyrus *Sm.*
1135 Photínia *Lindl* 1138 Amelánchier *Lindl* 1134 Cydónia *Juss.*

Order LXI SALICARIÆ

Most of these are very showy plants, in particular the genera Lýthrum and Lagerstrœ'mia, which are the representatives of the order They are chiefly natives of temperate climates, on mountains and among bushes. Glaux and Péplis are common shore plants in England Heímia is remarkable for its yellow flowers Little is known of the properties of Salicariæ, they are mostly astringent, the common Salicária is used in inveterate diarrhœas, a species of Lýthrum is used in Mexico as a vulnerary and astringent, and Lawsónia, which is used by the Turkish women to stain their nails, is also supposed to possess similar properties. There is a plant of this order called Hanchinol in Mexico, which is said to possess much more remarkable powers than any of the preceding, its expressed juice, taken in doses of four ounces, excites violent perspiration and secretion of urine, and is said to cure venereal disorders in an incredibly short space of time

877 Grislea *W.*	1094 Lýthrum *W.*	302 Ammánnia *W.*	898 Lawsónia *W*
1097 Cúphea *Jacq*	1095 Nesæ'a *Kunth*	568 Glaux *W*	1031 Acisanthéra *J*
1195 Lagerstrœ'mia *W.*	1096 Heímia *Lk*	836 Péplis *W*	

Order LXII. MELASTOMACEÆ

All these are remarkable as handsome tropical shrubs or trees, with large purple or white flowers, and leaves with several costæ, or nerves as they are incorrectly termed The genera admitted in the body of the work are those received by the greater part of previous writers, they have been much increased, and apparently with great propriety, by Mr D Don The species are generally ill treated in collections, where they are not unfrequently to be found under the form of sickly stunted plants, instead of noble broad-leaved spreading shrubs, with masses of brilliant flowers To be grown well they require much heat, much moisture during the summer, and much pit-room and head-room The fruit of true Melástomas is a fleshy insipid juicy berry, which is for the most part eatable, and is often so deep a black as to dye the teeth and mouths of those who eat it. They are nearly related to Myrtaceæ, from which they differ in the want of essential oil, and of the dot like reservoirs of the leaves which contain it The juice of the leaves of M succósa and aláta is used as a lotion for recent wounds by the inhabitants of Guiana

899 Osbéckia *W.*	1029 Melástoma *W*	1075 Blákea *W*
900 Ithéxia *W.*	1030 Petalóma *W.*	

Order LXIII MYRTACEÆ

Dotted leaves, with marginal ribs, and an inferior ovarium and single style, are the great features of Myrtaceæ They are all fine evergreen shrubs or trees, generally bearing white flowers, and in the first section producing fleshy fruit It is there that the Allspice, the Clove, the Rose-apple, and the Guava find their station, by the side of the common myrtle and pomegranate of Europe. The section with capsular fruit comprehends, with the exception of the gigantic Eucalyptuses, almost wholly, handsome hard-wooded New Holland or South Sea shrubs, with white or crimson flowers and stamens, yellow flowers are very uncommon The volatile oil contained in the little reservoirs of the bark, the leaves, and the floral envelopes, gives these plants the fragrance which has caused them to be celebrated by poets of all ages It is very aromatic, a little acrid, and slightly tonic and stimulant, whether it is under the form of Cajeputi oil, the produce of Melaleúca leucadéndron, or of oil of cloves or of myrtle In the clove this oil is so abundant as to constitute nearly a fifth of the whole weight of the calyxes that produce it There is also a considerable proportion of astringent principle in these plants, in the bark of the pomegranate it is very obvious, and in Mýrtus régni and lúma of Chile, Eugénia malaccénsis, it is so abundant as to render a decoction of those plants of great use in cases of dysentery Eucalýptus resinífera produces an astringent resinous substance resembling gum Kino The leaves of the Chilian myrtles, Leptospérmum scopárium, and some other species, have been used as substitutes for tea

1125 Stravádium *Juss*	1497 Barringtónia *W*	1498 Gustávia *W*

Order LXIV COMBRETACEÆ

Combrétum and Quisquális are among the most splendid of the climbing plants of the tropics, adorning the trees from which they depend with garlands of white and crimson, and yellow The bark of Bucida Búceras is used with success in Guiana for tanning leather The juice of Terminália vérnix is employed by the Chinese as a varnish, it is, however, caustic, and its exhalation dangerous, benzoin is the produce of Terminália Benzóin The kernel of several species is eaten as a nut, and the expressed oil has the remarkable quality of not becoming rancid

544 Conocárpus *W*	1027 Getónia *Rorb*	2140 Terminália *W*
916 Combrétum *W*	1028 Quisquális *W*	

Order LXV PASSIFLOREÆ

The beauty of Passifloras is well known, they are remarkable for the singular arrangement of the stamens and pistillum, upon a column surrounded by several lines of circumvallation, formed by as many rows of barren thread-like colored stamens, which are popularly called the rays The fruit of several species of passion-flower is filled with a pleasant acidulated pulp, on which account they are eaten as dessert fruit It is not known that they possess any medical properties The station of the order is not settled, it is undoubtedly very near Cucurbitaceæ

1459 Passiflóra *W*	2075 Modécca *Lam*

Order LXVI CUCURBITACEÆ

Here is the station of the gourd, the melon, and the cucumber, succulent climbing vegetables, the fruit of which administers to us many of our comforts and necessities The importance of the gourd in hot countries is of the highest degree, where, from the nature of the climate, few of those culinary vegetables that are so abundant in the north can be made to succeed Among these tribes of climbing annuals, the papaw tree is a remarkable deviation from the ordinary character of the vegetation. Its fruit, however, and flowers are in all respects those of Cucurbitaceæ The fruit is mostly sweet, watery, refreshing, and pleasant to the palate, but the coloquintida gourd, the spurting cucumber, and the Trichosánthes amára, are all possessed of violent bitter, drastic, purgative qualities, which are, indeed, to be found, in a slight degree, even in the mildest of the eatable gourds M Decandolle observes, that as the violent action of the Colocinth resin is much softened by the mixture with it of gum, it is probable that the difference in the fruits of the order depends upon the different proportions between these two substances The seeds of the gourd, like those of the

passion-flower, possess none of the properties of the pulp, they are sweet and nutty, and readily form an emulsion The roots of the bryony are purgative, but also contain a wholesome fæcula It is said that the roots of a species of bryony are eaten in Abyssinia, after being merely boiled There are some Cucurbitaceæ, the roots of which are intensely bitter, those of one of this description are used in Peru, to remove the pains attendant upon inveterate venereal disorders

551 Gronóvia *W* 2019 Trichosánthes *W* 2022 Cúcumis *W* 2024 Bryónia *W*.
1940 Anguria *W* 2020 Momórdica *W* 2023 Sicyos *W* 2095 Cárica *W*.
1976 Lúffa *Cav* 2021 Cucúrbita *W*.

Order LXVII LOASEÆ

Nothing is known of the qualities of this order It consists of succulent cut-leaved plants, generally covered with asperities or rigid stinging hairs, and yellow or white flowers They are all natives of America, and handsome annuals A very few of them are climbers

1113 Bartónia *Ph*. 1194 Mentzélia *W* 1619 Loása *L*

Order LXVIII HALORAGEÆ

Obscure weeds, chiefly distinguished from Onagrariæ, by their naked and solitary ovula They are natives of moist places or ponds, in various parts of Europe and North America Some of the species of Halorágis are tropical They are not known to possess any medicinal properties

23 Hippúris *W* 932 Halorágis *W* 1987 Myriophýllum *W* 309 Ludwígia *W*.
27 Callitriche *W*. 1908 Serpícula *W*. 258 Isnárda *W*

Order LXIX ONAGRARIÆ.

A very well defined order, generally known by its pollen cohering, by a sort of filamentous substance, an inferior polyspermous ovarium, a tetraspedalous tetrapetalous flower, with a definite number of stamens, and a single style From this form there are some anomalous variations, such as Circæ'a and Lopézia, which are, however, easily reconciled to the usual structure of the order Most of the genera are pre-eminently beautiful, as Epilóbium, Œnothéra, and Fúchsia, which are old favorites among gardeners The properties of Onagrariæ are little known, and probably very weak The leaves of Jussiæ'a peruviána are used as an emollient poultice, the seed of Trápa nátans as an eatable nut, and the root of Œnothéra biénnis as a sort of salad

71 Circæ'a *W* 903 Epilóbium *W* 1026 Jussiæ'a *W*
18 Lopezia *Cav* 904 Fúchsia *W* 901 Œnothéra *W*
902 Gaúra *W* 308 Trápa *W* 2064 Montínia *W*

Order LXX. FICOIDEÆ

These are all plants with a greater or less degree of succulence, the Mesembryánthemums and Hymenógyne are well-known dry-stove plants, many of which are beautiful in the highest degree Of the former of these two, the flowers are of all colors, many of the most vivid hues, and remarkable for expanding only beneath bright sunshine, this phenomenon, indeed, is common to the whole order Tetragónia expánsa, Sesúvium portulacástrum, and Mesembryánthemum edule, are excellent substitutes for summer spinach A large quantity of saline matter is contained in all of them, in Reaumúria vermiculáta, a substance is secreted, which has been found by chemical analysis to consist of muriate of soda and nitrate of potash The whole order grows in very dry or saline places, in the temperate regions of the world Four fifths of the whole are natives of the Cape of Good Hope The leaves of the different species of Mesembryánthemum, offer the most remarkable instances of figure known in the vegetable world

1090 Nitrária *W* 1143 Sesúvium *W* 1145 Tetragónia *W* 1147 Hymenógyne *Haw*
1107 Glinus *W* 1114 Aizóon *W* 1146 Mesembryánthemum *L*. 1210 Reaumúria *W*.

Order LXXI. PORTULACEÆ

With the exception of Turnéra, Támarix, Talinum, and a few species of Claytónia, the whole of this order consists of insignificant weedy plants, of no beauty, and little use Claytónia perfoliáta and common purslane, which are occasionally used as salads, being the only species of a useful kind They are chiefly herbaceous plants, frequenting dry barren situations, or the sea-shore of all parts of the world, all are insipid and inodorous, and destitute, as far as is known, of medicinal properties Some of the kinds of Támarix have an astringent tonic bark, and yield, when burnt, a large proportion of sulphate of soda Turnéra resembles a Cistus

224 Móntia *W* 1092 Talinum *Haw* 871 Limeum *W* 690 Corrigíola W.
537 Claytónia *W* 1093 Anacampséros *L* 692 Portulacária *W* 686 Turnéra *W*
689 Telephium *W* 1036 Triánthema *W* 1037 Scleránthus *W* 685 Támarix *W*.
1091 Portuláca *W*

Order LXXII CACTI

All succulent plants destitute for the most part of leaves, the place of which is supplied by fleshy stems of the most grotesque figure, some angular, and attaining the height of thirty feet, others roundish, covered with stiff spines, like the hedgehog, and not exceeding the stature of a few inches Their flowers are in many cases large and remarkably specious, varying from pure white to rich scarlet and purple, through all the intermediate gradations of colors The species are chiefly natives of the hottest and dryest parts of the tropics, and are cultivable with little care, in pots filled with rubbish, in a dry-stove Their fruit is fleshy and watery, and generally insipid, but it is eaten in their native countries for the sake of its refreshing moisture and coolness Two species of Opúntia are hardy in Great Britain The characters of this order and the next are very similar, although their habit is so widely different. Cacti are sometimes called Nopaleæ.

1111 Cáctus *W* 1112 Rhípsalis *Gært.*

Order LXXIII GROSSULACEÆ

Distinguished from the last by the definite number of their stamens and woody leafy stems. The utility and excellence of the gooseberry and currant are known to every one None of the other species equal these, although the fruit of several possesses considerable excellence The berry of most of these is sweet, watery, and acid, but that of Ribes nigrum, and a few more, is tonic and stimulant, which appears to have some connection with the presence of glands upon the leaves of those species.

550 Ribes *W*

Order LXXIV. SEMPERVIVEÆ.

Still another order of succulent plants, but with a habit very different from that of those which have gone before The species are often characterised by the rosulate or densely imbricated arrangement of their leaves, but this is not by any means a universal character They are natives, for the most part, of dry barren places in Europe, North Africa, and the Cape of Good Hope, and are cultivable with ease in pots of dry rubbish Many of them have extremely beautiful flowers, especially those of the genera Sempervivum and Crássula, which are either white, yellow, or deep rose color Their leaves are used medicinally as refrigerant and abstergent, they are also, in a slight degree, astringent, and in Sédum ácre so acrid, that, taken internally,

they operate violently both as purgatives and emetics. The leaves of Sédum teléphium are occasionally eaten as a vegetable, but they are always found to leave behind a slight and unpleasant taste of burning

1061 Sédum *W* 927 Vérea *W* 874 Séptas *W* 699 Crássula *W*
1110 Sempervívum *W* 698 Róchea *Dec* 1062 Penthórum *W*. 320 Tillæ'a *W*.
1060 Cotylédon *W*. 928 Bryophýllum *Sal*.

Order LXXV SAXIFRAGEÆ.

The whole of these plants constitute the glory and delight of the cultivator of alpine plants This is to be attributed to the neatness and perpetual verdure of their leaves, and the exquisite simplicity and elegance of their flowers, rather than to any striking attractions, of which they are wholly destitute their blossoms being generally white or pale pink, occasionally becoming brownish-purple All the genuine species are humble herbaceous plants, affecting mountainous situations, but occasionally found in marshes by the sides of springs, and even upon dry walls All are natives of cold regions, or of the most temperate mountainous situations of hot ones. They are slightly astringent, some of them, as Heuchéra americána, eminently so Infusions of the leaves have been reckoned lithontriptic, and the powdered root of the last-named plant is used with success in cancerous disorders. Hydrángea, which is shrubby, is not a legitimate inhabitant of the order.

1041 Saxífraga *W*. 1043 Mitélla *W* 930 Adóxa *W*. 1040 Chrysosplénium *W*.
1042 Tiarélla *W*. 606 Heuchéra *W*. 361 Gálax *W* 1039 Hydrángea *W*.

Order LXXVI. PHILADELPHEÆ

This consists at present of a single genus, which was formerly referred to Myrtaceæ, but which has lately been separated with much acuteness by Mr Don The species are hardy ornamental shrubs, natives of North America, with white flowers, in some cases fragrant Nothing is known of their properties

1114 Philadélphus *W*

Order LXXVII. CUNONIACEÆ

These were formerly included in Saxifrageæ, from which Mr Brown first distinguished them They are shrubs of the southern hemisphere, mostly with pinnated leaves and white flowers. Callicoma and Bauéra, which have simple leaves, are elegant green-house shrubs The bark of a species of Weinmánnia is employed in Peru for tanning leather, and is said to be also used for adulterating the quinquina Nothing is known of the properties of the remainder

1038 Cunónia *W* 1099 Callicoma *B R* 1199 Bauéra *H K* 919 Weinmánnia *L*

Order LXXVIII ARALIACEÆ.

Araliaceæ are a slight divergence from the well-known Umbelliferæ, with which they nearly agree in habit, except in being frutescent, and from which they are obviously distinguished by their 5-celled fruit Their flowers have no beauty, but the foliage of many is extremely fine, especially of the species of Actinophýllum, that of our common ivy must not be omitted Their medicinal properties are much the same as those of Umbelliferæ, except the fruit, which differs in virtues as it does in botanical structure Their bark exudes an aromatic gum resin, as in Arália umbellifera Their roots are tonic, with, in some cases, the flavor of parsnep The famous ginseng, which is produced by a Pánax, is reputed to have powerful tonic, restorative, and even aphrodisiacal qualities, but it is probable that these have been greatly exaggerated

607 Cussónia *L* 697 Actinophýllum *R & P* 1109 Gastónia *Juss*.
696 Arália *W* 549 Hédera *W* 2166 Pánax *W*.

Order LXXIX UMBELLIFERÆ

One of the least attractive groups of plants, and at the same time one of the most important to the world They are not more useful as food than they are dangerous as poison, while in their native ditches they are often suspicious lurid weeds, but under the influence of cultivation they lay aside their venom, and become wholesome food for man They are generally recognised by their hollow stems and cut leaves, with what botanists call a sheathing petiole, that is to say, with a petiole, the base of which wraps round the stem Their flowers are mostly white or greenish, rarely, as in Astrántia, some species of Caúcalis, and others, of a pink color The inflorescence is umbellate, and their fruit consists of two ribbed portions, improperly called seeds, which are held together by a common axis, and a thickened discus All are natives of damp ditches or way-sides, in cool parts of the world, in the tropics they are either extremely rare or wholly unknown, and when present, have generally a character unlike that of our European species The simplicity of their structure, and uniformity of their appearance, has rendered their classification a matter of very great difficulty It has been attempted in modern days by Lagasca, Sprengel, and Koch, all of whom have added something to our knowledge, but much still remains to be done The arrangement of Professor Sprengel, objectionable as it is many points, is here adopted as the most perfect, upon the whole, of any yet published The culinary and agricultural importance of many species is well known, the parsnep and carrot form a large part of the staple winter store of the inhabitants of Europe, as the Arracachas do of those of South America, and the Prangos of Thibet is supposed to be the most important and productive of any in the whole world, as a forage plant The medicinal properties of Umbelliferæ are not more powerful than they are at variance with each other While the seeds of some are aromatic, and stimulating in the highest degree, the fresh roots and leaves of others are not less narcotic This has been supposed to arise from the difference in the state of the sap in different parts of the plant, and it has been thought that the narcotic principle is only to be found in the ascending sap, while the aromatic stimulant properties are found in the juices, which are fully elaborated and matured It has been already observed, that their dangerous properties are often removed by cultivation, the common celery is a familiar instance of this, but the most remarkable, that of Œnánthe pimpinelloides, a most dangerous species when wild, which is cultivated about Angers for the sake of its roots, which are there called Jouanettes, and about Saumur, where they are known by the name of Méchons The roots of some Umbelliferæ contain a large proportion of sugar, those of the carrot, when dried, more than an eighth, those of the parsnep just an eighth, and those of the chervil about eight parts in 100 Galbanum, Opopanax, and Assafœtida, are all the produce of different species of Umbelliferæ

ORDER LXXX RHIZOPHORÆ.

The mangroves are plants of arborescent stature, which are remarkable, in tropical countries, for growing upon the shores of the sea, even as far as low water The seeds have the singular property of germinating, while enclosed within the capsule, and adhering to their parent, and pushing forth a long thread-like radicle, which lengthens till it reaches the soil, where it takes root, and forms a new individual The bark of Rhizóphora gymnorhíza, which is very astringent, is used in India for dying black

1078 Rhizóphora *W*

ORDER LXXXI HAMAMELIDEÆ

Hardy American deciduous shrubs, with the appearance of Amentaceæ, to which they are undoubtedly closely allied notwithstanding their situation here, which must be considered quite artificial Nothing is known of their medicinal qualities

1200 Fothergilla *W* 312 Hamámelis *W*

ORDER LXXXII CAPRIFOLIACEÆ

This is an eminently beautiful order, consisting either of twining or erect shrubs with clusters of trumpet-shaped fragrant flowers, or of fine bushes having cymes of white blossoms. The honeysuckle is the representative of the former, the dogwood of the latter Here too is found the modest and delicate Linnæ'a, which, however inferior its attractions for the vulgar eye may be to those of its more ostentatious neighbours, yields to none of them in elegance or interest for the botanist All the genera have a more or less astringent bark, that of Lonicéra corymbósa is used in Chile for dying black, that of Córnus florida in North America in intermittent fevers, as is also the bark of Córnus sericea, which, according to Barton, is scarcely inferior to Quinquina The Elders are the link between honeysuckles and umbelliferous plants, to the latter of which they are allied by their stinking divided foliage and half herbaceous habit, their flowers are sudorific and soporific in a high degree, their leaves and inner bark are emetics and drastic purgatives Triósteum perfoliatum is intermediate between this order and Rubiaceæ, with the former of which it agrees in its purgative, and with the latter in its emetic, qualities, which resemble those of ipecacuanha All Caprifoliaceæ love shady cool places in both hemispheres, but few have been found in such as endure a very severe climate

474 Caprifólium *R S* 477 Diervilla *J* 306 Córnus *W*
475 Lonicera *R S* 478 Triósteum *W.* 679 Viburnum *W.*
476 Symphória *Ph* 297 Linnæ a *W* 680 Sambúcus *W*

ORDER LXXXIII LORANTHEÆ

None of these are cultivable, they are all genuine parasites rooting beneath the bark of the trees on which they grow, and deriving from their juices the whole of their nutriment The Viscums have little or no beauty, but the Loránthi are among the most lovely of plants, hanging in clusters of rich scarlet flowers from the branches of trees in the tropics, which they often clothe with a beauty not their own The misletoe of the Druids is supposed to have been the Loránthus europæ'us, the common Viscum never being seen upon the oak, while the Loránthus inhabits no other tree If this be so, the latter must have once existed in this kingdom although now extinct It has been suggested, that all vestiges of their religion were extirpated with the Druids, which will account for the Loranthus having disappeared wherever that religion formerly held its sway

2054 Viscum *W*

ORDER LXXXIV RUBIACEÆ.

Opposite entire leaves with intervening stipulæ, a monopetalous superior corolla, with a definite number of stamens and a bilocular ovarium, are the great characteristics of Rubiaceæ, an order of such extent that it embraces a very large proportion of the whole of phænogamous plants, including within its limits humble weeds and lofty trees, plants with important medicinal qualities and flowers of varied dyes, and herbs of neither value nor beauty as far as has yet been ascertained The sections into which the order has been divided are merely artificial, with the exception of Stellatæ, which are the representatives of the order in northern regions Among these the Rúbia, or madder, is the most important on account of its dye, Galium also possesses some qualities of minor consequence, which have been already indicated in the body of this work Among the other sections, the plants of beauty or value are innumerable: of the former description, the genera Ixóra, Bouvárdia, Catesbæ'a, Portlándia, Coutárea, Gardénia, Mussæ'nda, Hamélia, Cephaélis, Cephalánthus, and many others, are notable examples, to the latter, every genus has a contribution of one kind or another The root of Oldenlándia umbellàta is employed in India for staining nankin, that of Morinda umbellàta in the Moluccas, and of Morínda citrifólia in India, is used for dying red and brown The potent febrifugal properties of the Cinchóna need not be insisted on; it is less generally known that the bark of Pinckneya púbens, Macrocnémum corymbósum, Guettárda coccínea, and Portlándia grandiflóra, possesses similar, but weaker powers The bark and roots of Antirhóa are used, in the Isle of Bourbon, to stop hæmorrhage, and that of Morínda Róyoc is used for ink Astringent properties of a very marked character are found in the juice of Naúclea Gámbir of Hunter, and the Uncária Gámbir of Roxburgh, both which are often improperly confounded with Gum kino, which is the produce of a very different plant. Some of the species formerly comprehended under the genus Cinchóna, but since separated by the name of Exostémma, possess strong emetic powers. The same qualities exist in Psychótria emética Cephaélis, Ipecacuánha,

and Psychótria herbácea, which are often used as ipecacuanha. The seed of the Coffea furnishes the valuable beverage which is so much esteemed in Europe and the East, under the name of coffee

496 Morinda *W* 521 Naúclea *W* 275 Cephalánthus *W* 2060 Anthospérmum *W.*

ORDER LXXXV OPERCULARINEÆ.

Exotic weeds, nearly related to Rubiaceæ Their properties are unknown M de Jussieu has remarked that their affinity to Valerianeæ is supported by the curious circumstance, that birds devour the young shoots of the Opercularias as they do those of the Corn-salads

250 Operculária *W* 251 Cryptospérmum *P S*

ORDER LXXXVI. VALERIANEÆ.

Small herbaceous plants, more interesting for the sake of their symmetry and neatness, than on account of any particular attractions they may be considered a connecting link between Rubiaceæ and Dipsaceæ Many of the Valerians, and all the Patrinias, are pretty plants The Valerianéllas are useful esculents, known under the name of corn-salads Their medicinal properties are of a decisive character. The roots of Valeriana officinális, Phu, and others, are bitter, tonic, aromatic, antispasmodic, and vermifugal, they are occasionally used as febrituges The odour of Valerian is not generally agreeable, but the Orientals collect with care, on the mountains of Austria, the roots of Valeriána célica, with which they perfume their baths, and the natives of India, at this day, employ the Valeriána jatamánsi, the spikenard of old times, as a perfume, and against hysterics and epilepsy.

20 Centránthus *Mich* 78 Valeriána *W.* 80 Valerianélla *Dec*
72 Fédia *Dec* 79 Patrinia *W.*

ORDER LXXXVII DIPSACEÆ

Very nearly akin to Compositæ, of which they have nearly the habit All are herbaceous plants with flowers growing in heads Some of the Scabiósas are very handsome, and popular border flowers The whole tribe is cultivated with great facility Some of the species of Scabiósa have been employed as diaphoretic and antisyphilitic, but are now neglected

70 Morina *W* 263 Cephalária *Schr* 265 Knaútia *W.*
262 Dipsacus *W* 264 Scabiósa *W*

ORDER LXXXVIII CALYCEREÆ

Obscure weedy South American plants, differing from Compositæ, chiefly in the position of their ovula.

1842 Acicárpa *Juss*

ORDER LXXXIX. COMPOSITÆ.

A most extensive and natural order, obviously characterized by the cohesion of their antheræ, and the arrangement of their florets in involucrated heads, or calathidia, as they are now called. Most of them may be said to be ornamental plants, and yet but a very few hold that station in the opinion of the public It is difficult to account for this circumstance, nor is this the place to enter upon such an investigation, certain, however, it is, that with the exception of Dáhlias, the varieties of Chrysánthemum sinénse, and a few Calendulas and Arctótises, and perhaps Tagétes, scarcely a single Composita now finds a place in a fashionable flower garden The prevailing color of the flower in the order is yellow, red, purple, or scarlet, being comparatively uncommon The species inhabit every part of the world, and in all, perhaps, in nearly equal proportions — in Europe and the north of the world they are chiefly herbaceous, but within the tropics, they are more frequently frutescent. Their medical properties are very important; Tussilágo fárfara, Chamomile, Inula, Solidágo Virgaúrea, Matricária Parthénium, Stévia febrifúga, and Eupatórium perfoliàtum, are instances of the presence of tonic and febrifugal properties, Tanacétum and Santolina are anthelmintic, Matricária and the Achilléas emmenagogue, some Eupatóriums, Achilléas, Artemísias, and Caléndulas, are sudorific; certain Liátrises are diuretic, and Erigeron philadélphicum is both sudorific and diuretic. Ptármica and Arnica are sternutatory, and Spilánthes, Siegesbéckia orientália, Anthemis pyréthrum, and others, powerfully excite salivation, finally, many Achilléas, Chamomile, Tanacétum, and Eupatóriums, are tonic and antispasmodic Others seem to possess all these properties combined, and are reckoned among the best alexiterics, as the Ayapana of Brazil, and the Guaco of Peru. Every one knows the excellent and refreshing flavor communicated to vinegar by Tarragon, the same effects are produced in the Alps by Achilléa nána, Artemísia glaciális, rupéstris, and spicáta Some species of Achilléa, Bellis, and Artemisia have been used as substitutes for tea The seeds of many Compositæ, as Mádia and Verbesina, yield a copious oil, and the fleshy roots of Helianthus tuberósus, a wholesome food for man. The juice of Lactúca virósa is highly narcotic, and has been even employed with extraordinary advantage as a substitute for opium. It is not necessary to mention the utility of the leaves of the lettuce, the endive, the succory, the cardoon, or the roots of Scorzonéra and Salsafis, as culinary productions, they must be familiar to all our readers, as also the fleshy receptacle of the artichoke and some other plants The flowers of Echinops strigósus are used as a kind of tinder, those

of the artichoke, the cardoon, and others, have the power of curdling milk The arrangement of Compositæ is attended with extreme difficulty, the greatest progress that has yet been made in reducing them to order has been with M Cassini, by whom they are called Synantheræ but unfortunately, the remarks of that learned botanist are so scattered and unconnected, that the public has hitherto been able to derive little benefit from his labors His general arrangement is here adopted, but for the reasons now given, his genera have not been enquired after, as, until they shall have been more completely systematized, the adoption of them would necessarily be full of errors, which would only add to the confusion that already too extensively exists Those who wish to make themselves masters of this very interesting and difficult branch of systematic botany, should consult the Opuscules phytologiques of M Cassini, and Mr Brown's elaborate essay on the structure of Compositæ, in the Transactions of the Linnean Society

Order XC CAMPANULACEÆ

These differ from the last in not having the flowers in heads, in their usually distinct antheræ, which are, however, syngenesious in Lobélia, in their polyspermous fruit, and also in exuding a milky juice All the genera are pretty, and some highly ornamental They are mostly herbaceous, and by far the greater number are extra-tropical, abounding especially in the woods and coppices of the North The roots of Campánula Rapúnculus are used as a vegetable under the name of Rampion The juice of some of the Lobéliaes is highly caustic and inflammatory, when taken internally, producing vomiting and even death nevertheless, the root of Lobélia siphilitica, in small doses, acts as a diaphoretic, in greater quantity as diuretic or purgative, and, if taken in considerable quantities, as an emetic An infusion of Lobélia inflàta is used in North America as a remedy for leucorrhœa, and the root of Lobélia cardinàlis is employed in the same country as a vermifuge

464 Lobélia *W* 466 Trachélium *W* 467 Roélla *W* 834 Canarina *W*
463 Campánula *W* 546 Lightfootia *L'Her* 545 Cyphia *W* 547 Jasione *W.*
465 Phyteuma *W* 895 Michauxia *W.*

Order XCI GOODENOVIÆ

New Holland and South Sea herbs or undershrubs, very nearly akin to the last, from which they differ more in artificial characters than in habit All of them are pretty, and deserving culture Nothing is known of their properties

468 Goodénia *R Br* 470 Dampiera *R Br* 473 Scæ'vola *R. Br*
469 Euthales *R Br* 472 Velleia *Sm.*

Order XCII STYLIDEÆ

Like the last, the properties of this very small but curious order are, if any, undiscovered All are inhabitants of New Holland, and either herbs or half-herbaceous shrubs They have pink flowers, ornamented with glittering glands, their stamens are united into a column, which is terminated by a sessile stigma, and which is irritable in so high a degree, that, if touched with a pin, it instantly starts from its place with great elasticity

1932 Stylidium *R Br*

Order XCIII GESNERIEÆ

Fine tropical herbs, with broad, fleshy, downy leaves, and purple or scarlet flowers They all require stove heat, and decayed vegetable soil, in their native country, which is chiefly equinoctial America, they are found growing in the woods, where the earth is little more than a bed of rotten leaves and bark

1290 Gesnéria *W* 1291 Cloxinia *W.*

Order XCIV ERICEÆ

These are distinguished from the neighbouring orders by their polyspermous fruit, aristate anthers, and dry shrubby habit Every genus is eminently beautiful, and worthy of the most assiduous cultivation The first tribe is a native of hill-sides and open plains, chiefly of the extra-tropical regions of the earth Some are famous for their beauty, some for their fragrance, and many for their foliage The heaths are the glory of the Cape, the Arbutuses of Europe, the Andrómedas of America, and Cléthra of the Canaries The second tribe is distinguished from the rest by its inferior berry, and is not less valuable for its fruit than conspicuous for its beauty The species are principally North American Monotropeæ stand in their systematic station as they grow in their native woods, lowly herbs among thickets of bushes and trees Rhodoraceæ, once considered a distinct order, are chiefly North American, their flowers are less tubular than those of true Ericeæ, but their habit is not materially different, here the Azálea the Kálmia, and the Rhododéndron, the pride of European gardens, as they are of their native woods, find their station The utility of the fruit of Vaccínium is well known, its bark is reckoned tonic, stimulant, and astringent, and their fruit slightly styptic The berries of Arbutus úva-úrsi are considered lithontriptic, its leaves have also been employed successfully in infusions in obstinate cases of gonorrhœa Extract of Chimáphila umbellata, in the form of pills, in doses of five scruples a day, has been found successful in cases of dropsy Some of the species are possessed of narcotic qualities, this is the case with Ledum, Rhododéndron chrysánthum, and especially Azálea póntica, honey obtained from the juice of which is said by Xenophon, to have caused the death of many soldiers in the famous retreat of the ten thousand An infusion of Rhododéndron máximum is used in America in cases of chronic rheumatism, and that of Rhododéndron póntieum in Asia, against gout and rheumatism

Subclass III. COROLLIFLORÆ.

Petals cohering in the form of a hypogynous corolla, which is not attached to the calyx
To this subclass are to be referred all genera which have a monopetalous corolla, with the stamens inserted into it, and a superior ovarium

Order XCV MYRSINEÆ.

Showy shrubs, with evergreen undivided leaves, and cymes of white or red flowers Theophrásta is a very rare stove plant, with a simple stem, and undulated spiny toothed leaves The Ardísias are common in collections None are natives of Europe, but are found in the hot parts of Asia, Africa, and America. Nothing is known of their properties.

408 Theophrásta *L* 435 Ardísia *W.* 443 Bæobótrys *Vahl*
409 Clavija *Fl. per.* 2160 Myrsine *R Br.*

Order XCVI SAPOTEÆ.

These are also shrubs, which are mostly evergreen, and natives of the warmer regions of the world. Some of the Bumélias are found in the southern states of N America, but none of the order exists in Europe They are chiefly valuable for their fruit, which, in many cases, contributes richly to the dessert Mimusops clénqi, Imbricária malabárica, Sideróxylon spinósum, are all of this description, the star apples of the West Indies, the produce of several species of Chrysophýllum, and particularly of C cainito, are esteemed delicious, and the Medlars, Lucumas, and Sapotillas of equinoctial America, all the fruit of different kinds of A'chras, are among the most valuable productions of the western world The seeds of all the order are oily those of A'chras sapota are accounted diuretic and aperient Their oil is not fluid, but so concrete as to have the appearance and consistence of butter, whence the name of butter tree has been applied to different species both in Africa and India The most famous of this description is the Indian mava, mahva, or madhuca, the Bássia butyrácea of botanists, the seeds of which are so oleaginous, that a single tree has been known to produce three quintals of oil, the dried flowers of the same tree are mixed by some Indians with their food, and a kind of spirit is distilled from them by others. The juice of all the sapotas is milky, but not acrid and poisonous like that of most other lactescent orders, but, on the contrary, yielding a wholesome beverage or food Here is supposed to belong the famous Palo de Vaca, or Cowtree of South America, the trees of which are regularly milked by the inhabitants of the districts in which it grows According to Brown, the bark of some of the A'chrases is so astringent and febrifugal as to be substituted for quinquina

423 Buméla *W* 426 Jacquínia *W.* 434 Manglilla *Juss* 1024 Inocárpus *W.*
424 Chrysophýllum *W* 427 A'chras *W* 881 Mimusops *W* 1074 Bássia *W*
425 Sideróxylon *W* 433 Sersalisia *R Br*

Order XCVII SYMPLOCACEÆ

Shrubs with serrated leaves, turning yellow in drying, and small white flowers which are sometimes fragrant The leaves of most of them are astringent, those of Alstónia tinge the saliva greenish yellow, of Símplocos tinctória are used in America under the name of Sweet-leaf, for dying yellow

1614 Símplocos *L*

Order XCVIII. EBENACEÆ

Some of these are hardy trees or shrubs, with deciduous leaves and white flowers, natives of woods, mountains, and banks of streams in North America and Europe, others are tropical evergreens Among the former, the best known are the Snow drop tree, or Halesi, with pendent showy white blossoms, and the different species of Stýrax of the latter, many of the Diospyruses' produce are eatable fruit, as, for example, the Mabolo of the Philippine Islands, which is as big as a peach, and the Kaki of Japan, which resembles an apricot All these fruits are remarkable for their extreme austerity before maturity, and the necessity of letting them decay, like our medlars, before they are fit for table These are also distinguished for the excessive hardness of their wood, and for the black colour it sometimes acquires when old, as the Ebony The bark of Diospyros virginiána is used in North America in intermittent fevers

1035 Rovéna *W* 2159 Diospýros *W* 1081 Halésia *W*
2086 Mába *J* 1025 Stýrax *W* 1105? Visnea *W.*

Order XCIX OLEINÆ

The olives are known by their monopetalous corolla, with a valvular æstivation, two stamens alternate with the segments, a bilocular ovarium with no discus at the base, and pendulous collateral ovula They were formerly combined with the jasmines They have all simple opposite leaves, their flowers are either white, yellow, or purple, and frequently fragrant The Phillyréas are among our finest evergreens, and the Lilac or Syringa perhaps at the head of hardy deciduous bushes The ash is an anomalous genus which hardly belongs to the order The seed of the olive contains so large a proportion of fixed oil, that it has long been one of the most important objects of cultivation in the South of Europe The bark and leaves of many Olex are bitter and astringent, these properties are particularly apparent in the ash, which has often been employed successfully as a febrifuge From the exudation of many species of that genus, the mild purgative called manna is formed, it is most commonly found upon the O'rnus M Decandolle remarks, that in proof of the natural affinity of the plants here combined, and of the propriety of separating the jasmines from them, it has been found that all the olives as now restricted, will bud or graft upon one another, but not on the jasmines Thus the lilac will graft on the ash, the Chionánthus, and the Fontanesia, and even upon Phillyréa latifólia, and the olive will take upon the Phillyréa, and even on the ash

32 O'lea *W* 34 Chionánthus *W* 67 Linocíra *R P* 69 O'rnus *P S*
33 Phillyréa 36 Ligústrum *W* 66 Fontanésia *W* 2157 Fráxinus *W*
35 Noteiæ'a *B P* 37 Syringa *W*

Order C JASMINEÆ

Fragrance is the predominant property of the jasmine, and has made it for ages the favourite of poets and of the people, this arises from the presence of an oil which can be extracted so as to retain its perfume In medicinal qualities, the jasmines do not differ materially from the last, they are neatly distinguished by botanists by the direction of their ovula which are erect in Jasmineæ, and pendulous in Oleinæ.

38 Nyctánthes *W* 39 Jasminum *W*

Order CI APOCYNEÆ

We now turn from the contemplation of plants endued with mild and agreeable properties and fragrant flowers, and often bearing food for man, to others which are among the most dangerous and fatal poison, whose juices, milky indeed, like the Cowtree, are not a wholesome and delicious beverage like those of Sapotæ, but on the contrary acrid, caustic, or bitter They are readily known by the twisted direction of the segments of the corolla, which have been compared to the rays of a Catherine's wheel, whence they were called by Linnæus, Contortæ By far the greatest part of the order consists of tropical trees and shrubs a few Apocynums, Amsonias, and Vincas, are natives of the colder zones of the earth Many are elegant climbers, as the different species of Echites and Melodinus The splendid Oleánder belongs to Nérium, the different species of Plumeria, Cameraria, Strophánthus, and Arduina are stove plants of the greatest beauty The medicinal action of these plants is highly powerful The Strychnos, or nux vomica tree, is remarkable for its bitterness and acrid deleterious effects, which are indicated not only when introduced into the stomach, but still more violently when absorbed into the system by inoculation In general, the Apocyneæ are acrid, stimulating, and astringent, these principles, when in excess, act so powerfully on the nerves as to produce stupefaction The root of Ophióxylon is very bitter and purgative under the name of snake-root it is used in India as an antidote to the bites of serpents The bark of Cérbera Mánghas is purgative, of Echites antidysentérica, and the Wrightia of the same name, astringent and febrifugal, the leaves of the Vinca are so astringent, that they have been used successfully in tanning, those of Nérium oleánder are said to abound in free gallic acid The inspissated juice of a species of Cérbera, known in Mexico under the name of Yeotli, is a fatal poison

Order CII ASCLEPIADEÆ.

These differ from the last only in having the stamens united into a sort of fleshy crown, and the pollen coherent in masses of a waxy substance like that of Orchideæ, their properties, habit and geographical range, are much the same Periplóca is a singular instance of an asclepiadeous plant being a hardy shrub, every other frutescent species of the order being natives of countries where frost is unknown Hoya comprehends climbing plants, with waxen, clustered, odoriferous flowers distilling honey Pergulária is valued for its fragrance, Ceropégia for its singularity, and Asclépias for beauty and hardiness But the most extraordinary genera of the order are Stapélia, Piaránthus, and Huérnia, in which the place of leaves is supplied by fleshy short stems of various forms, and whose flowers are not less singular for their curious and complex organization, than they are remarkable for their strange coloring and spotting, and offensive for their fœtor The root of Gymnéma vomitórium, Asclépias curassavica, Calótropis procera, and some others, is employed in different countries for ipecacuanha An infusion of the root of Asclépias decúmbens has the singular property of exciting general perspiration, whence it is successfully used in Virginia for pleurisy It is very singular that, in a tribe of plants so generally poisonous as these are, the young shoots of some species should be an article of food of this nature are Pergularia édulis, Periplóca esculénta, Apócynum indicum, and several more

Order CIII GENTIANEÆ.

An order in some degree intermediate between Polemoniaceæ and Scrophularineæ, from both which it is distinguished both by habit and fruit, some of the genera border closely upon Apocyneæ The species are natives of cool or mountainous regions or pools in all part of the world The Gentians are mostly dwart herbaceous plants, with deep blue flowers, the bitter color, and different shades of orange, being the prevailing hues They are all pretty, and many beautiful in the highest degree, but, with a few exceptions, they are impatient of cultivation The medicinal properties of the root of Gentiána lutea, rubra, and purpúrea, are eminently tonic, stomachic, and febrifugal, their bitterness is second only to Quássia Similar, but more feeble virtues, are found in most of the order, especially in Villarsia ováta, Gentiána peruviána, Chirayíta, Frasera Walteri, &c Spigélia anthelmia is used as a vermifuge, and the root of Spigélia marylandica infused in water as anthelmintic, and in wine as febrifuge Potália amára is used in Guiana as an emetic A kind of spirit is distilled in Switzerland from the roots of Gentiána, macerated in water

Order CIV BIGNONIACEÆ

The showy trumpet-shaped flowers and broad leaves of these plants, render them objects of general admiration The greatest number is found in the equinoctial regions, a few only passing beyond those limits to the north Bignónia rádicans is a hardy climbing plant, of exceeding beauty, and the Jacarandas are resplendent with flowers of blue or purple, and leaves which emulate the elegance of the Acácia Nothing important is known of their qualities Their wood is said to resist the attack of worms

64 Catalpa *Juss* 1294 Bignónia *W* 1295 Jacaranda *Juss*

Order CV COBÆACEÆ

A climbing genus with large purple flowers, recently separated from the Bignónias by Mr Don Nothing is known of its medicinal properties

588 Cobæ'a *Cav*

Order CVI POLEMONIACEÆ

Herbaceous plants with showy blue, red, or white flowers, and often with pinnated leaves They are natives of cool or mountainous parts in Europe and America Nothing is known of their properties

369 Phlox *W* 70 Polemónium *W.* 389 Cántua *W* 390 Hoitzia *Cav.*

Order CVII CONVOLVULACEÆ

Nearly the whole of these are twining plants, with showy flowers expanding beneath the influence of bright sunshine A few are shrubs, but the greater part are herbaceous, and very many annual They are frequently, also, weeds, which, from their creeping roots, are difficult to extirpate All parts of the world produce them, from the cold regions of the north to the burning soil of the equator Cúscuta is a singular parasite, wholly destitute of leaves The root of many is filled with a milky acrid juice, which is very purgative. Scammony, jalap, and some other drugs, are the produce of Convolvulaceæ The root of Convólvulus floridus and scopárius, and Ipomæ'a quamóclit, is stimulatory, that of Convólvulus batátas, which is the sweet potato of America and Southern Europe, and Convolvulus édulis are wholesome articles of food

Hydroleæ are little known, pretty, herbaceous plants, mostly with blue flowers, native both of cold and tropical countries, Diapensia lapponica being an inhabitant of Lapland mountains, and Hydrólea spinosa of West Indian marshes Their botanical characters are very nearly the same as those of Polemoniaceæ The roots of Hydrolea spinósa are reputed bitter, and slightly purgative

Order CVIII BORAGINEÆ.

True Boragineæ are chiefly herbaceous plants, with alternate exstipulate leaves, the surface of which is covered over with minute asperities, and with flowers arranged in one-sided spikes or racemes, occasionally solitary Each flower has also four distinct little nuts or seeds, as they are commonly called Some Echiums

and a few more are shrubs They are found abundantly in Europe, Siberia, and the North of Africa, less commonly in India, and the equinoctial parts of the world, in some quantity in North America, and in tolerable abundance in New Holland Within the tropics the order is principally represented by Heliotrópiums and Tournefórtias, in colder latitudes by Anchúsas, Cynoglóssums, herbaceous E'chiums, and the like Some are mere weeds, quite unworthy of culture, others are eminently beautiful, as many E'chiums, Onósmas, Onosmódiums, Sýmphytums, and others In general they are mucilaginous and emollient, qualities which are especially abundant in the root of Sýmphytum and Cynoglóssum Pure nitre has been found in several plants of the order A red color is given out by Anchúsa tinctória, Lithospérmum tinctórium, and Onósma echioides, which is used in dying Several plants are employed on the same account in America The Hydrophylleæ are often considered as distinct, on account of their capsular fruit and cartilaginous albumen One or two of these are pretty plants, but most of them mere weeds

ORDER CIX CORDIACEÆ

Trees formerly referred to the last order, from which their habit, plaited cotyledons, and dichotomous style divide them Little is known of their properties, except that the flesh of their fruit is emollient and mucilaginous The nuts of Córdia Sebesténa are employed sometimes as laxatives

428 Córdia *W*	429 Varrónia *W*	430 Ehrétia *W*	431 Bourréria *Gert*

ORDER CX SOLANEÆ

The baneful nightshade represents this order, which participates very generally in its qualities, although they are frequently hidden beneath a fairer form, and often much mitigated, Many of the Solánums are very handsome The Verbáscums, Daturas, and Solándras are all plants of great beauty, although the former, on account of their frequency, are despised in gardens Cápsicums are famous for their pungent fruit and seeds, Brunsfélsias for their fragrance, and Nicotianas, or Tobacco, for their fœtor The leaves indeed of the whole order are disagreeably scented The usual effect of Solaneæ is narcotic, but it is thought that this has been exaggerated, on account of the intense and deleterious properties of A'tropa belladónna These, according to the observations of Vauquelin, depend upon the presence of a bitter nauseous matter which is soluble in spirits of wine, forming with tannin an insoluble compound, and giving out ammonia when decomposed by fire Notwithstanding the narcotic power of the roots of the Mandrake, the Belladónna, and others, those of the potato are found to contain an abundant fœcula, which is among the most valuable food of man The leaves of many Solaneæ are exciting and narcotic, but in very unequal degree, as in Tobacco, Physalis, Henbane, &c, those of the Nightshade excite vertigo, convulsions, and vomiting The juice of Stramónium is given in North America, in doses of from twenty to thirty grains, in cases of epilepsy The fruit of Physalis Alkekéngi is a veterinary diuretic, that of P édulis is used in tarts, that of Solánum Lycopérsicum, and Melongena, is served at table in various forms, under the name of Tomatoes and Aubergines

ORDER CXI OROBANCHEÆ

Leafless parasites on roots, with brown or colorless scaly stems and flowers

1335 Orobánche *W*	1339 Lathræa *W*

ORDER CXII SCROPHULARINEÆ

A great part of Linnæus's Didynamia Angiospermia is found here, capsular fruit and didynamous stamens being among the most obvious characteristics of the order The species are generally herbs with opposite leaves, very rarely shrubs, and natives of mountains, valleys, ditches, woods, and wayssides, in all parts of the world The Personatæ have the palate so prominent as to close up the orifice of the corolla Ringentes have the palate open Some are highly ornamental, as Digitális, Pedicularis, Calceolária, &c, others are mere weeds, as is the case with a large proportion of them Most of them have a weak unpleasant smell, a bitterish taste, and acrid and suspicious properties, but this odor is sweet and aromatic in the Ambúlia of Lamarck, the taste is refreshing in Mimulus luteus, which is a culinary plant in Peru, and the ordinary acrid properties become emollient in some Antirrhinums The Rhinanthaceæ are remarkable for their astringent tonic bark and leaves The leaves and roots of Scrophulária aquática, Gratíola officinalis and peruviána, and Calceolaria, act as purgatives, or in strong doses produce vomiting these properties exist, in a high degree, in Digitális purpúrea The leaves of this plant, reduced to powder, excite vomiting and vertigo, excite urine and saliva, and lower the pulse in too strong doses they cause death, in moderate doses they are useful in scrophula, dropsy, asthma, &c

Tribe 3 MELAMPYRACEÆ

1315 Melampyrum *W.*

ORDER CXIII LABIATÆ.

A portion of Diandria Monogynia, and the whole of Didynamia Gymnospermia of Linnæus, make up Labiatæ, which are characterized by their didynamous stamens, four little nuts or naked seeds, single style, and irregular corolla. They are mostly natives of extra-tropical countries, although under the form of Hyptis, Anisoméles, Leúcas, O'cymum, &c, they are found in the hottest zones of the world Many are extremely odoriferous in the leaves, some bear handsome flowers, but by far the greater part are no better than weeds They are all remarkable for their tonic, cordial, and stomachic virtues · they contain both a bitter and an aromatic principle, in different proportions The bitterness which is given out in decoctions, resides in a gum-resinous secretion abounding in some Teúcriums, which are particularly employed as stomachics, and sometimes as febrifuges those which abound in essential oil, and which are consequently aromatic, are used as stimulants From the different degree of combination of these principles in different plants, they have obtained various uses, such as savory, thyme, marjoram, for seasoning of food, sage, balm, ground ivy for tea, marum, marjoram, lavender, and thyme, for sternutatories, others, such as lavender, mint, balm, and rosemary, for perfumes It is a remarkable fact, that the essential oil of all contains camphor, which exists in such quantity in sage and lavender, that it has been supposed that the separating of it might become an object of commerce

ORDER CXIV PEDALINÆ

Herbaceous plants, formerly included in Bignoniaceæ, from which they are distinguished by the small number of seeds in each cell of the fruit Natives of the tropics, with shewy trumpet-shaped flowers The seeds of Sésamum abound in oil, which is easily expressed, for which the common species is extensively cultivated in hot countries

1296 Sésamum *W* 1300 Martýnia *W* 1331 Pedálium *W.*

ORDER CXV MYOPORINEÆ

South Sea and New Holland shrubs, with scarcely any hair The leaves are simple, alternate, or opposite, with no stipulæ The flowers, scarlet, white, or blue, axillary without bracteæ These are very near Verbenaceæ Stenochílus is the handsomest genus of the order the Avicénnias are shore plants, growing in the place of the mangroves, and shooting their long roots to a great distance among the mud, sometimes to the length of six feet along the surface before they fix themselves Their medicinal properties, if any, are unknown

1323 Avicénnia *L* 1332 Myopórum *Forst* 1333 Stenochílus *R Br* 1334 Bóntia *R Br*

ORDER CXVI VERBENACEÆ.

A mixture of weeds and shewy herbs, of humble creeping plants and of lofty timber trees Some of the Viteces and Clerodéndrums are handsome shrubs Aloýsia is esteemed for the fragrance of its flowers, and Holmskiöldia for the refulgent scarlet of its enlarged calyxes Tectona produces the famous Indian teakwood No properties of consequence have been attributed, by medical men, to any plant of the order, those formerly ascribed to the vervain and chaste-tree being now disregarded The species are natives of waysides in Europe, and of woods and barren plains in the tropics

65 Ghinia *W*

ORDER CXVII ACANTHACEÆ

These are known by the elastic dehiscence of their capsules, and the hooked processes of the seeds. They are almost entirely tropical herbs or shrubs, with the pubescence, if any, simple or capitate, but never stellate Their leaves are opposite, occasionally arranged in fours, simple and undivided, or very seldom lobed The flowers are either in imbricated heads or open racemes, always enclosed in their bracteæ, and are white, blue, yellow, scarlet, or purple Some of the species are very shewy, but few of them are cultivated commonly, a large proportion are mere weeds The Thunbérgias are fine climbers, and the Acánthus móllis, the foliage of which gave rise to the classical acanthus of architecture, is, perhaps, except Morina pérsica, one of the most interesting of hardy herbaceous plants It is also one of the few species to which any medical properties are ascribed, being used sometimes as an emollient by reason of its mucilage Justícia biflóra is employed in Egypt as a poultice, J Ecbólium as a diuretic, and J pectorális as a vulnerary

45 Elvtrária *M* 49 Eránthemum *P B* 1304 Ruéllia *J.* 1306 Aphelándra *R Br*

48 Diclíptera *W*

ORDER CXVIII LENTIBULARIÆ

Very pretty interesting aquatics, which are scarcely susceptible of cultivation, except in a few cases Pinguiculas are either European or North American, inhabiting elevated patches in bogs the Utric are floaters, found in most countries in marshes and little rills. their flowers, are white, yellow, or b

52 Pinguícula *W* 53 Utriculária *W*

Order CXIX PRIMULACEÆ

Beautiful dwarf herbs, inhabiting the mountains and meadows of all parts of the world, but especially in the northern hemisphere Nothing can be more lovely than the little delicate alpine Primulas, Androsáces, Aretias, and Soldanéllas, with their little modest blossoms, sometimes rivalling the whiteness of the surrounding snow, sometimes emulating the intense blue of the empyrean, as if the one had borrowed its hues from heaven, and the other from the spotless mantle of the earth Hottónia is a naiad of the stream, inhabiting several parts of England, in ponds and ditches, which are enlivened for many a month with its rosy flowers, peeping from among the sedge and under grass, by which it is environed All the genera are familiar to gardeners, except Centúnculus and Schwénckia, of which the former is singular in the order, as being an obscure minute weed, and the latter has inelegant green flowers, curious to the botanist but ungrateful to the florist The prominent botanical character is the one-celled fruit, with a central placenta, and the stamens opposite the petals. The properties of Primulaceæ are feeble and of little consequence, they appear to be slightly astringent and bitter, the root of Cyclamen is acrid, and only eaten by wild boars, the flowers of the primrose and cowslip are fragrant, and mildly sudorific and soporific Cortúsa Mathiola has been used in nervous disorders

350 Prímula *W*	352 Soldanélla *W*	356 Lysimáchia *W*	277 Centúnculus *W*
349 Androsáce *W*	353 Dodecátheon *W.*	392 Lubinia *Comm.*	42 Schwénckia *W.*

351 Cortùsa *W*	355 Hottónia *W*	360 Córis *W*	862 Trientális

Order CXX GLOBULARINÆ

Pretty alpine plants with blue flowers The leaves of Globulária Alypum are very bitter and powerfully purgative, giving at the same time a tone to the stomach and intestines

260 Globularia *W*

Order CXXI. PLUMBAGINEÆ

These are properly placed at the limit between Monochlamydeæ and Dichlamydeæ, to either of which they are referable in the minds of some botanists, although it appears, upon the whole, to be most convenient to station them where they are now arranged They are low shrubs or herbaceous plants, with shewy red or blue flowers of an arid texture, inhabiting salt marshes and subalpine tracts, in the temperate latitudes of both the northern and southern hemispheres All the Statices and Armérias are fine plants worth cultivating The root of Statice Limónium is astringent and tonic, of the Plumbágos, the root and whole plant are acrid and caustic, and employed as vesicatories

324 Plumbágo *W* 705 Arméria *W en* 706 Statice *W en*

Subdivision II. MONOCHLAMYDEÆ.

Perianthium simple

The absence of corolla characterizes this subdivision of dicotyledonous vegetation, but as the term corolla is subject to frequent misunderstanding, it should be borne in mind, that whenever there is only one floral envelope, that envelope is to be considered calyx, whether green, as in most cases, or colored, as in the Marvel of Peru

Order CXXII PLANTAGINEÆ

Little inconspicuous herbs found in waste places all over the world The leaves are stellate, and occasionally ternate, the pubescence is jointed, the flowers are brownish, and arrayed in dense spikes Their leaves are rather bitter and astringent, their seeds mucilaginous and rather acrid, those of Plantágo arenária are imported in large quantities from the south of France, for the purpose of forming an infusion in which muslins are washed P média is sometimes cultivated by farmers under the name of ribgrass

278 Plantágo *W* 1967 Littorella *W*

Order CXXIII NYCTAGINEÆ

With the exception of Mirábilis, in which the colored calyx has a shewy effect, all the order consists of weeds, growing often among the loose sand on the sea coast of the tropics and western hemisphere, none are found in Europe The Abronias are curious, neat, and often fragrant The root of Mirábilis Jalapa was formerly considered the jalap, which is now known to be an error, it is however purgative, although in a less degree Boerhaávia tuberósa is also a reputed purgative

19 Boerhaavia *W.* 81 Calyménia *R P* 322 Mirábilis *W* 323 Abronia *Juss* 804 Pisónia *W*

Order CXXIV AMARANTHACEÆ

Upon this order Dr von Martius has the following remarks Leaves, especially when young, of a lax soft texture, abounding in saccharine, mucilaginous, and fibrous particles, and therefore fit for food The seeds are farinaceous, consisting chiefly of starch and mucus Their virtues are nutritive, emollient, demulcent, the root of Gomphréna officinális is tonic and stimulant. The species are either gregarious or solitary, mostly diffuse and villous, and existing in dry stony exposed places, or erect and reclining on other vegetables, with little pubescence, when found on the skirts of ancient forests, a few are found in saline coast places, finally, they are more common in low land, little elevated above the surface of the sea, than in mountainous regions They are met with in both hemispheres, rarely under the equator, but increasing both northwards and southwards as we recede from them, they are confined to no countries in particular, but are found to affect all regions of the world Among an abundance of weeds, we distinguish a few fine plants deserving cultivation, as the Globe Amaránthus, the Cockscombs, and a few species of Amaránthus, one of which, under the name of Love-lies-bleeding, is commonly reared for the sake of its long, tail-like, pendent masses of crimson flowers Amaránthus oleráceus, and a few others, are occasionally cultivated as potherbs

552 Achyránthes *W*	556 Alternanthéra *R. Br*	563 Deeringia *R Br*	918 Aphanánthe *I k*
553 Philoxérus *R Br*	560 Érua *Juss*	565 Celósia *R Br*	1975 Amaránthus *W*
554 Desmochæ'ta *Dec*	561 Lestibudésia *R Br*	566 Gomphréna *R. Br.*	2069 Irésine *W*

Order CXXV. ILLECEBREÆ

Weeds distinguished from Amaranthaceæ by their membranous stipules They are found in dry barren places, for which they are better fitted than for a garden, unless as objects of curiosity.

555 Illecébrum *Juss*	569 Móllia *W*	82 Loéflingia *W*	226 Minuártia *W.*
557 Paronychia *Juss*	614 Hermária *W.*	221 Polycárpon *W*	227 Quéria *W.*
559 Anychia *Mich*			

Order CXXVI CHENOPODEÆ

The habit of this order is a better distinction from Amaranthaceæ, than any artificial character which it is easy to point out While Amaranthaceæ have a dry perianthium with a dense inflorescence, Chenopodeæ on the contrary have a fleshy perianthium and a very effuse inflorescence In the former, the stamens are usually

inserted under the ovarium, in the latter into the calyx, but this mark is not constant None of them, unless Phytolácea is excepted, can be esteemed plants of ornament, on the contrary, they have a weedy uninviting appearance, which is not improved by the fetid smell of some of them But, although their appearance is less attractive than that of the Amaranths, their use to man is far more considerable Their qualities are very various, Camphorosma has the smell of camphor, Petivéria stinks like onions, Phytolácea roots, leaves, and berries, are violent purgatives and emetics, the latter are esteemed in North America nearly equal to Guaiacum, and are employed in chronic rheumatisms, and in rheumatic pains following venereal diseases, an extract of the berries has been employed in scrophula and cancerous ulcers, and the young shoots of the plant are eaten in the United States as asparagus Some of the Chenopódiums, as Ambrosioides, Bótrys, &c., possess antispasmodic and tonic properties, the leaves of Spinácia, and of many Chenopódiums, are eaten as spinach, as are those of Basella in China and India Salsóla and Salicórnia are often employed as pickles Beet roots are equally valuable as a culinary and agricultural production, and the leaves are an excellent vegetable when boiled But the most remarkable feature in the properties of the order is the abundant production of soda, which is obtained from many of the species, as from all the Salsólas, Salicórnias, Anabásis, many species of A'triplex, several salt marsh Chenopodiums, and others The seeds of Chenopódium anthelminticum are used as a vermifuge, those of A'triplex hortènsis excite vomiting, frequently attended with acute pain, those of Chenopódium quinóa are said to be used as rice To conclude this list of remarkable properties in one of the most vile of all assemblages of plants, the roots of beet yield an abundance of sugar

Order CXXVII POLYGONEÆ

Herbaceous or suffrutescent fleshy-leaved plants, chiefly natives of the northern hemisphere; a few Polýgonums and Coccolobas are found to the south, the former in barren places, the latter on sea shores A great part of the order consists of worthless weeds Some of the Polýgonums, and all the Eriogonums, are handsome plants, the Rheums are famous in medicine The root of Rheum is tonic and purgative, most of the Rumexes and Polýgonums are also tonics The juice of the Coccolóbas is very astringent The young leaves and shoots of several species of Rumex and Rheum are eaten either raw or baked, under the name of sorrel, French sorrel, and tart rhubarb For the sake of its seeds, Polýgonum Fagopýrum is cultivated by farmers under the name of buck-wheat, the seeds of P. aviculare are very emetic and purgative The fleshy calyx of the Coccolobas is colored, and, the fruit growing in clusters, the genus has received the name of the sea side grape

Order CXXVIII BEGONIACEÆ

The acid qualities, sheathing stipules, and alternate leaves of these tropical herbs approximate them to Polygoneæ, notwithstanding the very different structure of their fructification Most of the species are pretty, some very handsome, all requiring great heat and humidity to be grown in perfection

1980 Begónia *W*

Order CXXIX LAURINEÆ

Noble trees or shrubs with handsome foliage and inconspicuous flowers They are chiefly natives of hot countries, where they constitute some of the most valuable of the productions known under the name of spice By botanists they are readily recognized by the singular circumstance of their anthers having each four cells, the valves of which are hinged as it were to the upper edge of each cell, and do not open longitudinally like those of most other plants It is well known that the cinnamon is the produce of the Laurus Cinnamomum, and that its properties are eminently aromatic, warm, and stomachic The same peculiarities, but in a less degree, exist also in Laurus Cássia, L. malabathrica, and L. culilában, which are all occasionally substituted for true cinnamon, they are found in the leaves of Laúrus parvifolia, in the bark of the species which produces the Pichurim bean, in that of L. cupuláris, which is the Isle of France cinnamon, of L. quixos, which yields the Peruvian cinnamon, in L. Benzoin, which was used as spice in the United States during the American war, and finally, in the common bay tree of our plantations Laúrus sassafras yields the sassafras chips of the shops, but its bark is much more powerful The fruit of many Laurineæ are extremely aromatic, that of Laurus Pérsea is an agreeable West Indian fruit, called the alligator pear Camphor is the produce of Laurus cámphora, and of another or two, this substance is found indeed in small quantities in the roots of almost all the order, one of the cinnamons is even named Capuru Carundu, which signifies camphorated cinnamon

934 Laúrus *W*
936 Cassýtha *W*
1942 Hernándia *W*
1077 Agathophýllum *W*

Order CXXX MYRISTICEÆ

Closely allied to the last, especially in sensible properties The arillus of Myristica is the mace of the shops, and its nut, the famous nutmeg It is well known that this abounds with oil, in Viróla sebífera the oily secretion is so copious, that it is readily separated by immersion in boiling water under the form of fat.

2120 Myristica *W*

Order CXXXI PROTEACEÆ

Favorite shrubs with gardeners, both on account of the neatness of their foliage and the beauty of their flowers With very few exceptions, they are confined to the southern promontory of Africa, and to New Holland, where they adorn large tracts of country They are shrubby or arborescent plants with an arid habit The leaves are simple, evergreen, narrow, entire or serrated The flowers generally grow in clusters, and are green, yellow, or red, sometimes in true Proteas surrounded by colored bracteæ with dark hairy margins Their stamens are four, with distinct anthers, which rarely adhere together The pollen is triangular, the stigma undivided and usually oblique Their fruit is of various kinds, either a solitary nut or a sort of cone consisting of many nuts immersed among the indurated remains of abortive flowers Of their properties, little is known Some of the Rhópalas afford tolerable timber, the bark of Prótea speciósa and grandiflóra is astringent and useful in diarrhœas The seeds of Embóthrium tinctórium yield a powder which is employed for dying pink The Próteas of the Cape, and the Banksias and Dryándras of New Holland, are the finest plants of the order

246 Rhópala *R Br*
247 Bánksia *R Br*
248 Dryándra *R Br*
2142 Brabéjum *W*

Order CXXXII. THYMELÆÆ.

Nearly all shrubby plants, found in all parts of the world, but most abundantly in the south of Africa. The flowers are white yellow, or red, most commonly in clusters, and often fragrant, the foliage is entire, either smooth or silvery, and generally very neat Their wood is particularly soft, their inner bark easily separable, and in Daphne Lagetta, pulls out by the division of the vertical fibres into a sort of network resembling lace Their bark is extremely acrid, acting as a vesicatory when applied to the skin, and if chewed, producing extreme heat and torture in the mouth, a decoction of it has been used with some success in venereal diseases The seeds of these plants are poisonous to man, but birds eat them with impunity The fibres of Dirca and Lagétta are used for cordage, those of Daphne gnidium and Passerina tinctória are employed in the south of Europe for staining wool yellow, which is converted into green by the addition of Isátis

73 Pimeléa *B P* 910 Daphne *W.* 913 Stelléra *W* 915 Lachnæ'a *W.*
249 Struthíola *W* 911 Dirca *W* 914 Passerina *L* 1032 Dáis *W*
909 Lagétta *J* 912 Gnidia *W*

Order CXXXIII SANTALACEÆ.

Trees or dwarf herbs, with inconspicuous or unattractive flowers They are chiefly natives of the Cape, New Holland, and India, a few only being found in Europe and North America Their virtues are few The wood of Sántalum álbum has a sweet aromatic flavor, and a slightly bitter taste it is chiefly known as a perfume, although it is said to possess mild sudorific properties The leaves of Myoschílos are purgative, of Osyris japónica eatable as salad, Thésium is slightly astringent

307 Síntalum *W.* 908 Memécylon *W* 2051 Osýris *W* 2161 Nýssa *W*
569 Thésium *W* 1033 Bucida *W* 2141 Fusánus *L* 2162 Hamiltónia *W*

Order CXXXIV ELÆAGNEÆ

Hardy shrubs or small trees, with deciduous leaves, covered, as well as the bark, with minute silvery scales · their flowers are inconspicuous, but sometimes agreeably fragrant. They occupy but little space, a few inhabiting China and Japan, and the remainder Europe, North America, and Guiana. The berries of Hippóphae rhamnoides, which are slightly acid, are used as a kind of sauce by the Swedes

259 Elæágnus *W* 2057 Shephérdia *Nutt* 2058 Hippóphae *W*

Order CXXXV ARISTOLOCHIÆ

Here we are on the limits of Monocotyledones and Dicotyledones The species are herbaceous or half shrubby plants, with simple, often reniform, leaves, and mottled grotesque flowers, usually brownish purple Their roots are all bitter, and possessed of tonic and stimulating properties, but the degree in which they exist in different species is not at present ascertained The Aristolochias have been in former days praised as emmenagogues, and many are still used in South America as a remedy for the bite of serpents A'sarum europæ'um is a purgative and emetic when fresh, but its powers are much diminished by drying, its dried leaves are occasionally used by the country people in some parts of England as a sternutatory

1072 A'sarum *B* 1934 Aristolóchia *W*

Order CXXXVI EUPHORBIACEÆ

Weeds and lofty trees, of such varied appearance and property, that it is scarcely possible to frame a brief character by which they can be expressed Their vegetation in cold countries is mostly herbaceous, in hot countries frutescent or arborescent, their juice is milky, and their flowers mostly inconspicuous It is for their medicinal properties that they are chiefly known, and these are as various as their aspect, mostly, however, dangerous, and always to be suspected In a few of them, the smell and taste are aromatic, but in most, there is either no smell or it is nauseous, and the taste constantly acrid and pungent Some possess also an acrid limpid fluid, which is given out by the leaves when touched Many of them act strongly upon the kidneys, as several species of Phyllanthus, the leaves of Mercuriális ánnua, and the root of Ricinus communis Many are said to be powerful medicines in cases of dropsy The bark of several Crótons, the wood of Cróton Tiglium and Búxus, the leaves of the same, and also of Cicca disticha, several Euphorbias, and others, are recorded as sudorifics, and useful against syphilis, as emetics, we find the roots of the Euphórbias, the juice of Cómmia, A'nda, Mercuriális perénnis, &c A great number are purgative, especially the leaves of Búxus and Mercuriális, the juice of Euphorbia, Cómmia, Hura, the seeds of Ricinus, Cróton Tiglium, A'nda, and Jatropha The effects of some others are so dangerous, particularly Hippómane, that it is not advisable to administer them even in very small doses, even in many Euphórbias it is difficult to draw a line between the quantity in which they are poisonous, and that in which they are harmless or useful The nature of their poison is mostly acrid, occasionally, however, mixed with something narcotic, as is apparent from the effect of those which are used for poisoning or rather stupifying fish The purgative oil in which the seeds of many are found to abound, has been determined to reside wholly in the albumen, hence the embryo of some, as Omphálea diándra, is eaten as nuts Boiling or roasting has also the effect of dissipating their noxious effects, thus Játropha Manihot, than which there scarcely exists a more dangerous poison, affords a food when submitted to fire, called cassava, the flour of which is often used in London as a luxury for making puddings, than which few are reputed to be more wholesome But the most curious of all the products of Euphorbiaceæ is the Caoutchouc, that singular substance which, although the produce of dangerous acrid trees, possesses nothing whatever which has been found capable of acting upon the human system in whatever way applied, which is unalterable either in air, in water, or in spirits, although it softens at a high temperature It is chiefly produced by Siphónia elástica, but also exists in the juice of very many others, as Excæcária Agallócha, Hippomane Mancinélla, Húra crépitans, Sápium aucuparium, Plukenétia volúbilis, the Játrophas, Mábea, Ompháleas, and many others Tournesole, another curious chemical preparation, is the juice of Cróton tinctorium, but is also found in several others Many other properties belong to this order, which it would be too long to detail in this place. The curious reader will find ample information in the medical division of M Adrian de Jussieu's monograph of the order, from which most of the foregoing remarks are taken

ORDER CXXXVII RESEDACEÆ

Weeds of no interest, except the Réseda odorata for its delicious fragrance R lutéola, a common annual in waste places, yields a yellow color fit for dying

1102 Réseda *W* 2099 Datisca *W.*

ORDER CXXXVIII CALYCANTHEÆ

Handsome grateful deciduous shrubs, with deliciously fragrant flowers, natives of North America and Japan They are not known to possess any medicinal virtues but their odour insures them a place in every garden, notwithstanding the uninviting look of the blossoms themselves

1157 Calycanthus *L* 1158 Chimonanthus *Lindl*

ORDER CXXXIX ATHEROSPERMEÆ

Allied to the last in sensible and botanical qualities they are shrubs, natives of America and New Holland, of which little is known either to gardeners or botanists

2103 Peúmus *Pers*

ORDER CXL EMPLEUREÆ

Dwarf heath-like shrubs, with obscure flowers and berries, natives of Europe and North America

2045 Empetrum *L*

ORDER CXLI URTICEÆ

Few are the objects in this order deserving the care of the cultivator, it is rather extraordinary, however, that those few are abundantly so Among worthless weeds and shabby half herbaceous shrubs, some of which are covered with rough points, and others defended by stinging hairs, we find the fig, the mulberry, the nemp, the hop, and the bread-fruit, all objects of the first consequence to the world Here also is placed the half fabulous Upas, with which lying travellers and credulous naturalists have long deluded Europe The Upas tree is now known to be the Antiáris toxicária, the inspissated juice of which is indeed a frightful poison, but the baneful effects of whose branches are purely imaginary Similar, though inferior, qualities have been found to exist in Ficus toxicária, and some of the Artocarpuses The root of the black mulberry is bitter, acrid, and purgative, of Dorsténia brasiliénsis, emetic, of D contrayérba, bitter, aromatic, hot, and stimulant A decoction, or the dried leaves, of hemp, is eminently narcotic, and forms the basis of the well known intoxicating Turkish drug called Bang or Haschisch The tenacious nature of the fibres of the hemp is also found in other plants of the order, especially Urtica cannabina, the hop, the bread-fruit tree, the common stinging nettle, and others

1962 Urtica *W* 1993 Phelygonum *W* 2043 Cecrópia *W* 75 Gunnéra *W*

983 Forskohlea *W* 2167 Ficus *W* 257 Dorsténia *W.* 2050 Stilágo *W*

ORDER CXLII AMENTACEÆ

Here is the group in which all the timber trees of Europe, and most of those of all cold countries, are stationed Every genus consists of plants important to the wants of man The alder, the birch, the willow, the poplar, the oak, the chesnut, the hornbeam, and the plane, are all collected in this place, to which they have been brought by the coincidence of similar fructification existing in all of them This similarity depends upon their producing flowers of one sex only, the males of which are always arrayed in catkins, of which the flowers are destitute of calyx or corolla, in the place of which is produced a single scale Their bark is furnished with an astringent principle, which has rendered them valuable either for staining black, as in the alder and the oak gall, or for tanning, as in the oak, or as febrifuges, as the alder, the birch, the oak, most of the willows, and also Populus tremuloides, which is well known in North America as a tonic and stomachic febrifuge The substance called tacamahaca was formerly supposed to be produced by some of the poplars, but it is now believed to be obtained from a very different plant, Fagára octándra The fruit of many Amentáceæ contains a considerable proportion of fecula, which renders it fit for the food of man and other animals, as the acorns of the oak, the mast of birch, the nut of Castanea and Córylus, &c

1955 Alnus *W* 2001 Liquidámbar *B* 1995 Ostrya *B* 1997 Fágus *W*
1956 Bétula *W* 2002 Platanus *W* 1996 Carpinus *W* 1998 Córylus *W*
2042 Salix *B* 2005 Salisburia *L T* 1994 Castanea *W* 2000 Quércus *W.*
2087 Populus *W*

ORDER CXLIII ULMACEÆ

Many of the observations upon the last order are also applicable to this, which differs rather in certain technical characters, than in any arrangement of nature The elm is its representative, from which the others only slightly differ

616 Planéra *Mich* 615 Ulmus *I* 2145 Céltis *W*

ORDER CXLIV CASUARINEÆ

These are nearly related to Coniferæ, than which they are dwarfer, and of far less importance By various writers they have been tossed about between Amentaceæ and Coniferæ, and have at last settled in a place by themselves The leaves of Comptónia asplenifolia are employed in the United States against diarrhœa The berries of Myrica cerifera yield, on boiling, an abundance of wax which is manufactured into candles, the nuts of Ephédra distáchya are eatable, the wood of some of the Casuarinas is remarkably hard and durable.

1936 Casuarina *W* 1941 Comptónia *W.* 2056 Nagèia *Gærtn.*
2115 Ephédra *W.* 2055 Myrica *W.*

ORDER CXLV CONIFERÆ

These bear the same relation in point of consequence to resinous trees, that Amentaceæ bear to those that are not resinous They are well known as lofty timber, yielding valuable wood and abundance of resin.

Among them is now numbered the loftiest tree in the world, a species of pine found by Mr. Douglas in California, which grows 220 feet high, with a circumference of 60 feet Pitch, turpentine, Venice turpentine, are produced by various species Gum Sandarach, by Thúja quadriválvis, a matter like olibanum, by Juniperus lýcia, a sort of liquid storax, by Altingia excélsa. The Juniperuses in which the resin is "incompletely oxygenized," are more fragrant, and also stimulating in a greater degree, as the savin for example The berries of many of these plants possess similar qualities Their seeds are all oily, those of Pinus Pinea, Cémbra, and Lambertiána, and Salisbúria adiantifólia, are eatable as nuts The fleshy fruit of the ivy, which is poisonous, is an exception to the general innoxious character of the order Coniferæ are mostly inhabitants of the northern parts of the world, where they form immense forests, and supply with their dense persistent leaves the place occupied by the evergreen trees of warmer climates A few are found in the southern hemisphere

2012 Pinus *W* 2017 Cupréssus *W* 2112 Araucária *J* 1970 Exocárpus *Lab*
2013 A'bies *Salisb* 2018 Thúja *W* 2010 Bélis *Salisb* 2016 Podocárpus *L'her*
2014 Lárix *Salisb* 2013 Juníperus *W* 2011 A'gathis *Salisb* 2114 Táxus *W*
2015 Schubértia *Mirb*

Order CXLVI. CHLORANTHEÆ

Obscure Asiatic weeds of no known use, and wholly destitute of interest for gardens

25 Chloránthus *W*

Order CXLVII PIPERACEÆ

The peppers are far more valuable in commerce than interesting in cultivation, their flowers being in all cases very insignificant, and their leaves so uniform in appearance, as to create but little variety Nearly the whole indeed of the herbaceous species or Peperomias, as they are sometimes called, are mere weeds The berry of the pepper is well known to be hot, aromatic, pungent, and stimulating, not only in the common peppers of the shops, but also in P cubeba, carpúnga, and heterophýllum The Piper amalágo yields a strong smell of anise, a decoction of its berries is used in Spanish America for washing ulcers The Piper Bétel and Sirihóa afford the Malays a powerfully acrid and exciting preparation, which, they suppose, invigorates and enables them to withstand the debilitating influence of their climate In the South Sea Islands, an inebriating beverage is procured by the mixture of the leaves and stems of P inébrians with water No pepper has yet been found beyond the limits of the tropics Saurúrus is the representative of the order in extra-tropical countries

77 Piper *W* 872 Saururus *W*

Order CXLVIII CYCADEÆ

The true station of this very curious order is extremely uncertain Although placed here in conformity with the common practice, it is to be supposed that its true station is in the immediate vicinity of ferns, with which the species agree in vernation, and in many curious particulars All are natives of countries beyond the reach of frosts, chiefly of the Cape of Good Hope and equinoctial America With a low trunk which rarely exceeds the height of a few inches, they have the fronds and appearance of pigmy palms, and the inflorescence of gigantic Equisétums The trunk of Cýcas contains a great quantity of fæcula, which is manufactured into a kind of spurious sago, and a similar substance, it has lately been ascertained, may be obtained from the stem of Cýcas (*Gard Mag*, vol iv)

2107 Cycas *W* 2108 Zámia *W*

Class II. MONOCOTYLEDONES.

The physiological peculiarities of this class of plants have been already explained in the general remarks which precede this arrangement of natural orders To what is there stated, little remains to be added, except that in these northern regions, every thing included in it is herbaceous, and that in hotter latitudes, few deserve the name of either bush or tree, except the palms, and a few Aroideæ and Asphodeleæ

Section I *STAMENS EPIGYNOUS*

Order CXLIX HYDROCHARIDEÆ

Floating white-flowered plants, of which Stratiotes is the most majestic They possess no known properties, but have the singular character in Monocotyledones of being in some cases lactescent. The species are natives of various parts of the world

308 Trápa *W*. 859 Damasónium *W* 2089 Hydrocháris *W* 2096 Stratiótes *W*

Order CL ORCHIDEÆ

Of all tribes of plants, this is the most singular, the most fragrant, and the most difficult of culture The flowers are often remarkable for their grotesque configuration, which has been likened to heads and bodies of animals, and for the strange character of their stems, which are sometimes attenuated into a degree of gracefulness scarcely equalled even among grasses, and sometimes contracted into a clumsy goutiness of figure such as is known no where else The species are found inhabiting the mountains and meadows of the cooler parts of the globe, or adhering by their tortuous roots to the branches of the loftiest trees of the tropical forest, to which their blossoms often lend a beauty not their own Vulgarly, this last description of plants is called parasitic, they are, however, not so, deriving no support from the juices of the plants on which they grow, but on the contrary, are epiphytes, merely adhering to other plants for support, and vegetating amidst the rich black soil which collects at the foot of all trees growing in a hot humid climate It is very singular that the pollen of these plants has no parallel, except among the very different and distinct order of Asclepiadeæ The only medical properties of the order exist in the roots of some of the Orchises, from which the nutritious substance called salop is prepared The Vanilla of the shops is the pod of the genus called Vanilla. From the boiled stems of some of the Brazilian species a tenacious glue is obtained, which is employed in many useful purposes

Tribe 8 CYPRIPEDIEÆ

1931 Cypripédium *H*

ORDER CLI SCITAMINEÆ

These are distinguished from the last by their pollen not cohering in masses, their seeds not being winged, and their plurilocular ovarium. Their sensible qualities are also widely different. The species are natives only of the tropical parts of the world, where they form stemless or caulescent herbaceous plants, with long broad leaves, and flowers of white, yellow, or red, often possessing great fragrance, and generally much beauty. Their sensible qualities reside either in the root or the seeds. The former is the part used of the Ginger, the Galangale, the Costus, Turmeric, Zedoary, and others, all of which are more or less aromatic. The root of turmeric is also well known as affording a yellow dye, a property which it possesses in common with some others. The seeds of Cardamom are well known for their aromatic stimulating powers.

6 Hedýchium *W*
7 Roscóea *Sm*

13 Amomum *Rosc*
14 Curcuma *W*
15 Globba *Rosc.*
16 Mantísia *Smns*

ORDER CLII CANNEÆ

Differing from the preceding, in the absence of aromatic principles, in the petaloid nature of the filament, and the single cell of their anther, they wholly resemble them in external appearance and geographical distribution. The Cannas are well known for their beautiful flowers, and the Maranta arundinácea is celebrated for the abundance of nutritive fæcula which is prepared from it, and imported to Europe under the name of arrow-root.

1 Canna *W*
2 Maránta *W*
4 Thália *W*
5 Phrynium *W*
3 Calathea *Meyer.*

ORDER CLIII MUSACEÆ

A noble order of plants, resembling the two last in appearance, but of far more gigantic stature, different geographical distribution, and sensible qualities. All the species, without exception, are among the grandest in the vegetable world, whether the breadth and beauty of their foliage, or the surpassing grandeur of their flowers, be considered. They are not, like Scitamineæ and Cannea, confined to the tropics, but approach in many points towards the cooler latitudes of either hemisphere. While the Strelitzias, resplendent with orange and scarlet and white, are peculiar to the Cape of Good Hope, the plantain is laden with its enormous masses of wholesome pleasant fruit, in the mild climate of Madeira, the Helicons and Urānias appear in the sultriest forests of Madagascar and Guiana. The fruit of the Músa is, as just stated, pleasant and wholesome, the leaves of the same plant form a valuable thatching for cottages, and the fibres of a particular species are manufactured into a fine hemp, from which the most delicate muslins of India are prepared.

570 Helicónia *W*
571 Strelítzia *H K*
721 Musa *H*
722 Urānia *W*

ORDER CLIV HÆMODORACEÆ

The name of this order, derived from αἷμα, blood, indicates its most striking peculiarity, the roots of several species of Hæmodorum, Wachendorfia, and Heritiéra yielding a brilliant crimson dye. The species have equitant leaves, and six stamens, with anthers turned towards the ovarium, in which last character they differ from the closely allied order of Irideæ. They are found, with very few exceptions, in the Cape of Good Hope and New Holland.

111 Hæmodórum *Sm*
113 Dilátris *Ker*
718 Lophíola *B M*
719 Argolásia *Juss*
720 Anigozánthos *Lab*

ORDER CLV IRIDEÆ

The peculiarity of this order exists in the superior six-cleft perianthium, three stamens opposite the outer segments, and the anthers so inserted that the line of their bursting is towards the outside of their flower. Occasionally, they are still called by the old appellation of Ensatæ. Most of the species are extremely beautiful; and as they are generally very easily cultivated, they have become universal favorites in gardens. Many of the species are found by the side of streams, or in rich pastures in Europe, Siberia, and America, others adorn the most barren deserts of the same countries, with their perishable flowers, a third set, consisting for the most part of Sisyrinchium and its allies, are found in cool parts of the islands in the South Seas; and, lastly, a large proportion of the order contributes to the herbage of Southern Africa, that indescribable charm which has captivated all observers. Their medicinal virtues are trifling. Iris florentina and germánica have roots, which, when dry, smell like violets, and are slightly stimulant, acting as sternutatories or purgatives, according as they are employed. The stigmas of the Crócus form the well-known saffron, which differs from the general character of the order, in being aromatic, and possessing a valuable coloring matter, which has the singular property of entirely disappearing under the influence of the sun's rays.

Order CLVI AMARYLLIDEÆ

Here we have another group of vegetation so lovely as to have excited admiration from the days of Solomon, who called them the lilies of the field, down to our own period Their roots are all bulbous In stature they seldom exceed a foot or two in Doryánthes, and some species of Crínum alone, much surpassing such a size, in foliage they possess a uniformity of figure which is very singular, in color they vary from white and yellow to deep scarlet and azure blue, in fragrance they vie with the violet and the primrose Some of the species are natives of thickets in the cooler provinces of Europe and Asia; others are found deep rooted in the burning shores of islands where scarcely a blade of grass interposes itself between them and the torrid rays of a scorching sun, many spring up in the gloomy, damp, and sultry woods of equinoctial America, and another set intermingles with the Ixias and Gladioluses of Southern Africa Several of the Narcissi, independent of their beauty, possess emetic qualities, from the viscid juice of Hæmánthus toxicárius, the Hottentots procure a poison wherewith to smear their arrows

748 Alstrœméria *W*
749 Conanthéra *Fl per.*

Order CLVII HYPOXIDEÆ

America, New Holland, the Cape of Good Hope, Polynesia, and the Indian Archipelago give birth to these plants, which have sweet yellow flowers and linear leaves, protected by long weak hairs Nothing is known of their medicinal qualities.

750 Hypóxis *W.* 751 Curcúligo *H K*

Order CLVIII DIOSCOREÆ

A climbing stem, and broad, cordate, or angular leaves, inconspicuous yellowish flowers, and a large fleshy root, are the obvious characteristics of this order, of which the yam is the representative, the roots of this plant yield one of the most important articles of food in the tropical countries

2083 Testudinária *Burch* 2084 Rajánia *W* 2085 Dioscórea *W*

Section II *STAMENS PERIGYNOUS*

Order CLIX HEMEROCALLIDEÆ

These are fine shewy plants, bearing their flowers in umbels or racemes, either white, yellow, red, or blue, they are mostly inhabitants of temperate zones, and are of little utility, with the exception of the Aloe, the purgative powers of which need not be insisted on This genus is, besides, remarkable among Monocotyledones for its fleshy leaves, in which, and its woody stem, it offers a striking deviation from the usual structure of these plants

792 Brodiæ'a *Sm*

Order CLX ASPHODELEÆ

Different from Hemerocallideæ in their expanded flowers and dark crustaceous seed-coat, the only characters which have yet been discovered to distinguish them The species are all pretty, many very handsome, some bulbous, some with fasciculated roots, a few with arborescent stems They are uncommon in tropical countries, very abundant in temperate latitudes, and not unfrequent in the cooler regions of the world Among the prettiest are Gágea, Scilla, and Hyacinthus, the least interesting are Chlorophýtum and Zuccágnia Aspáragus and Dracæ'na have berried fruits, the former is diuretic, and when young is employed as a favorite food, the same properties are possessed by Scilla and Allium The stamens of Arthropódium are remarkable for their tuft of yellow hairs, of Dianélla for the thickening of the filaments Many of the Alliums are very pretty, and admired notwithstanding their unpleasant odor, their roots are all eatable, and those of some among the most useful articles of food Thysanótus, the fringed violet of New Holland, has rich purple blossoms, with long delicate fringes which sparkle in the sun, as if continually bedewed with minute particles of water From Phórmium tenax the strong fibrous substance called New Zealand flax is prepared Xanthorrhæ a has an arborescent stem which abounds in resin

2111 Rúscus *W*

Order CLXI SMILACEÆ

These scarcely differ from the baccate Asphodeleæ, except in their usually trifid style, and the membranous integuments of the seed Many are interesting plants, especially the lily of the valley, a species of Convallária, the odor of which is perhaps the most grateful in the vegetable kingdom Several others, as Uvulária, Smilacina, Polygonátum, and Trillium are objects of ornament Smilax is remarkable for its twining stems, and its leaves, which resemble those of Dicotyledones, the roots of several species form the sarsaparilla of the shops, a drug, the nature of which is mucilaginous and rather bitter, and which is employed as diaphoretic and diuretic Medéola is also an active diuretic The roots of Támus are purgative and dangerous

785 Uvulária *W*

2081 Smilax *W.*
2082 Támus *W*
850 Trillium *W.*
729 Páris *W*

Order CLXII BROMELIACEÆ

Of these the eatable pine-apple is the representative, from which the other genera differ more in the want of a fleshy fruit than in general appearance Their habit is acid, their leaves rigid and toothed with spines, and covered with minute scales, their bracteæ often colored with scarlet, and their flowers either white or blue

They are all natives of tropical countries, with the exception of Tillándsia, which, in the humid woods of Carolina, forms dense festoons among the branches of the trees; this, like many others of the order, is an epiphyte, vegetating among the black mould that collects upon the bark of trees in hot damp countries; others are inhabitants of deep and gloomy forests, and others form, with their spiny leaves, an impenetrable herbage in the extensive pampas of Buenos Ayres and Brazil. From the Agáve mexicana a fermented beverage is prepared, from which a strong colorless spirit, resembling the best Scotch whiskey, is distilled.

726 Bromélia *W* 727 Guzmánnia *Fl per.* 723 Bonapártea *F P* 725 Furcræ'a *F.*
728 Pitcaírnia *W* 729 Tillándsia *W* 724 Agáve *H K*

Order CLXIII. LILIACEÆ.

It is doubted whether several of the preceding orders are not rather sections of this, until, however, the combination of these shall be effected by some hand yet more masterly than those by which they have been divided, it is best to let them remain as they are. The beauty of the plants composing the Liliaceæ, strictly so called, is universally acknowledged, the rich colors of the branching lilies, the vivid hues of the painted tulip, the modest graces of the humble Erythróniums, and the portly forms of the Yuccas are all attractions of which no good garden should be destitute. The species are all inhabitants of either cold or temperate latitudes.

771 Lilium *W* 773 Fritillária *W* 782 Erythrónium *W*
772 Túlipa *W* 781 Yucca *W*

Order CLXIV. MELANTHIACEÆ.

These, too, are pretty herbs, although destitute of the grandeur of the preceding, which, however, they far surpass in the potency of their virtues. The flowers of many are inconspicuous, and of a dull-green or yellow color, sometimes assuming a livid hue, which will bespeak the nature of their powers. A dangerous or poisonous acrid juice is their characteristic, which is particularly active in some of them, such as the Colchicum and Veratrum. The roots of the former are the basis of the eau médicinale, and are now used in cases of gout with much success. The root of Veratrum is believed to have been the hellebore of the ancients, an active drug, which, administered in small doses, is a drastic purgative, in more abundance a violent emetic. The root of Helónias dioica, infused in water, is anthelmintic, but, steeped in spirits, yields a bitter and tonic tincture. The leaves of Colchicum and Veratrum often produce vomiting and severe pain in the animals that eat them, the flowers of the first are also said to be poisonous, and its seeds to possess the same properties as the roots, but in a milder degree. Groves and pastures in Europe and Siberia and North America are the most frequented by Melanthaceæ, several are found at the Cape, and Gloriosa is a native of the woods of middle Africa.

851 Colchicum *W* 847 Xerophýllum *Mich* 819 Androcýmbium *W* 858 Nolina *Mich*
784 Bulbocódium *W* 842 Lichtensteinia *W* 844 Tofieldia *Hud* 2128 Verátrum *W*
845 Melanthium *L* 848 Wurmbea *L* 852 Helonias *L* 783 Gloriósa *W*

Order CLXV. BUTOMEÆ.

Fine water plants, of which Bútomus, by general consent the most beautiful of British plants, has purple flowers, and Limnocháris, a native of the marshes of Brazil, has yellow ones.

939 Bútomus *W* 1175 Limnocháris *Rich*

Order CLXVI. ALISMACEÆ.

Handsome water plants, with white flowers, and many ovaria. Some are common in our English ditches, others are found in similar situations in the tropics.

860 Actinocárpus *R Br* 1988 Sagittária *W* 861 Alisma *W*

Order CLXVII. COMMELINEÆ.

Mostly inhabitants of marshy ground, in either hemisphere, but not known in Europe except in cultivation. America is their grand station. Many are insignificant creeping plants, especially the Commelinas; others, as the Pontederias are very handsome, and the Dichorizandras are exceedingly noble caulescent plants, with large thyrses of blue flowers: this color is the prevailing one of the order.

85 Callisia *W* 89 Aneilema *B P* 730 Pontederia *W* 766 Dichorizándra *Haud*
88 Commelina *B P* 90 Cartonema *R Br* 765 Tradescántia *W*

Order CLXVIII. JUNCEÆ.

Inconspicuous, rigid, worthless weeds, for the most part, Xýris and Philydrum, which have pretty yellow flowers, if belonging to the order, being exceptions. They clothe barren ground in most parts of the world, and are the first approach to the formation of a regular perianthium, as we ascend in the scale of vegetation. Xerótes has the habit of a low palm.

86 Xýris *L* 761 Luzula *Dec* 2076 Xerótes *R Br*
760 Júncus *L* 839 Flagellária *W* 172 Philýdrum *R Br*

Order CLXIX. ERIOCAULEÆ.

Pretty interesting little bog plants, found in all parts of the world. The order consists of Eriocaúlon only, many of whose species are easily cultivated, though seldom seen in gardens. The Eriocaúlon septanguláre, found in a lake in the Isle of Skye, is, perhaps, the rarest of European plants. They are not known to possess any medical virtues.

223 Eriocaúlon *W*

Order CLXX. PANDANEÆ.

With the habit of palms and the inflorescence of Aroideæ, this fine order stands very distinctly separated from all others. The stem is an arborescent caudex, either growing to a considerable height, or weak, and lying on the ground. The leaves of some are formed into a coarse cordage, the flowers of P. odoratissimus, and the fruit of some others, are eaten. All are tropical.

2004 Carludóvica *Fl per* 2041 Pandánus *W.*

Order CLXXI. NAIADES.

Floating uninteresting plants, scarcely susceptible of cultivation; they form a close approach to Cellulares.

1938 Zannichéllia *W*

Order CLXXII. RESTIACEÆ.

Rigid, inelegant, often leafless plants, with split vaginæ, and the habit of some Cyperaceæ, or true Junceæ. They are all inhabitants of the southern hemisphere, especially of the Cape of Good Hope and New Holland.

2046 Willdenóvia *Th* 2047 Réstio *W* 2048 Elégia *W.* 2110 Leptocárpus *R Br*

Order CLXXIII. PALMÆ.

These were well named by Linnæus, the princes of the vegetable world, for they far surpass all other plants in the grandeur and majesty of their port. Their lofty stem, supported by a mass of fibrous roots, which frequently creep along the surface of the ground, consists of wood with longitudinal fibres, soft in the centre, but hard as horn itself at the circumference, it is almost always unbranched, bearing a tuft of leaves at the summit, in a very few cases it is dichotomous, always round, and it terminates by a single bud, by the fall of the petioles of the leaves, which sheath it in a greater or less degree at the base, it is covered with large scars The leaves, technically called fronds, are pinnate or flabelliform, never simple, and, in a young state, before they expand, they are folded up in plaits from the base to the apex The flowers are small, with bracteæ at their base, either sessile or seated in some cavity, of a pallid color, and contained in a large bag called a spatha, when they open, the mass of inflorescence, called a spadix, bursts suddenly through the under side of the spatha, generally evolving the most fragrant odors Impregnation takes place rapidly, through the injection of the pollen upon the humid surface of the stigmas, which gape open to receive it. The fruit is perfected in a period varying from six months to a year, when ripe it is a drupe or berry, with either a fibrous or fleshy coat, the mass of its kernel consists of only albumen, which, in the case of the cocoa nut, is soft enough to be eaten, but which in most species is as hard as horn Dr von Martius, the celebrated traveller in Brazil, to whom the world is indebted for nearly all that is known of these plants, concludes his remarks upon the characters of the order in the following words — "Palms, the noble offspring of Terra and Phœbus, are natives of those happy countries within the tropics, where the rays of the latter are ever beaming In all such climates they are to be found, with this limitation, however, that in the southern hemisphere they do not overstep the 35th degree of latitude, nor in the northern the 40th Most species are confined within fixed and narrow bounds, for it comes to pass that wherever a district is characterized by striking peculiarities of soil or climate, those species exist which are not found elsewhere, but few, on the contrary, extend over a large extent of surface, as the Cócos nucífera, Acrocómia sclerocárpa, Borássus flabelliformis, &c It is probable that the number of palms existing on the face of the earth, will be found by future travellers to amount to as many as a thousand species Most of them love the margins of springs and streams, but few establish themselves on the shores of the ocean, and yet a smaller number ascend into the alpine regions of their country, some collect in large forests, some are scattered singly or in clusters, among woods and plains In the most ancient periods of the world, when the genera of plants were beginning to be formed, palms scarcely existed, they were preceded in the creation by the more ancient Ferns, Cycadeæ, Grasses, and Equisetaceæ Some of their remains have, however, been found in variegated sandstone, and in limestone of the third order (fletzkalk), part of which belong to unknown species, and part to species still in existence But in the times succeeding the deluge, they appear, from the written evidence of historians and poets, to have followed the footsteps of man, to whom their fruit yielded food, drink, and oil, their stems houses, arms, utensils, flour, and wine, and their leaves cordage and roofs for habitations In cultivation their soil should be slightly saline, they are propagated by seeds more readily than by truncheons of the stem, when cultivated they undergo no alteration, except in producing more fleshy or stemless fruit it is extremely difficult to transplant them beyond their own country, naturally their migration is absolutely opposed by the barriers of the ocean"

Section III *STAMENS HYPOGYNOUS*

Order CLXXIV GRAMINEÆ

The order of grasses is beyond doubt the most natural of all that the ingenuity of systematic botanists has contrived, it is also the most numerous in species The inflorescence is very much alike throughout the order, and the floral envelopes, which are bracteæ in a progressive state to the form of calyx and petals, offer few striking characters by which the genera can be characterized Hence it is that the classification of the order, and its division into genera, has not only been found extremely difficult, but has given rise to much difference of opinion among botanists, some of whom, adhering to the synthetical arrangement of Linnæus, admit but a small number of genera, while others, admitting the analytical principles of modern science, divide it into a vast number The middle course in this, as in most other cases, is probably the just one A subdivision of the order into tribes, has been attempted by Palisot, Trimus, Dumortier, Raspail, Kunth, Link, and others, that of M Kunth is here adopted The general habit of grasses is so familiar to every one, that it may be passed over in silence They are remarkable for exhibiting, in no case, properties that are actually poisonous, possessing on the contrary, in almost all cases, wholesome and nutritive qualities These latter are especially obvious in their seeds, which always contain a farinaceous substance, mixed with a certain proportion of glutinous matter No one is ignorant of the various and important uses of the seeds of wheat, rye, barley, oats, maize, rice, and others, and in general of all the larger kinds of grass It must however be remarked, that if the smaller sorts are not employed in like manner, it is merely on account of their minuteness, and not on account of any difference in their nature, in fact, in times of scarcity, and in half cultivated countries, use has advantageously been made of Festúca fluítans, Zizánia aquática, Avéna fátua, Pánicum sanguinále, Avéna elatior, Brómus secalínus, and Elymus arenárius It is also to be noted, that the particular uses for which the seeds of certain grasses are employed, are not peculiar to them, but may be obtained from all the others, with slight modifications Thus beer is made, not only from barley but also from wheat, spirituous liquors not only from our European cerealia, but also from rice But it must be remarked, that a singular exception to the generally wholesome properties of grasses, appears to exist in Lólium temuléntum, the seed of which is reported to be narcotic and inebriating, and even poisonous, there is no doubt, however, that these qualities have been greatly exaggerated, for in the first place they disappear in bread or beer manufactured from Lólium temuléntum, and secondly, in times of scarcity, people have frequently lived upon it But even supposing all that has been stated upon the subject to be true, this plant will still be found to be little different from wheat, when long exposed to wet, so well, indeed, is this known by country people, that a belief exists, that in wet summers wheat is actually transmuted into rye grass The exciting properties of the oat, which are very unusual in this order, have been found to reside in the husk and not in the seed, and to depend upon the presence of a minute quantity of an aromatic principle, analogous to Vanilla, lying imbedded in the envelope of the seed, and capable of being extracted by aid of alcohol As to the deleterious effects of the ergot of rye, these do not depend certainly upon any such property in the rye itself, but is caused either by the ergot disease, or, as is believed, by the parasitic fungus, from the attack of which it arises Now let us pass from the seeds of Gramineæ to their stems, and we shall find a no less remarkable uniformity of nature in them They all contain, especially before flowering, a sweet sugary mucilage, which varies in quantity in different species The sugar cane, in which this is found in greatest abundance, not only constantly exists in the most favorable condition for producing it, as it rarely flowers, but is also one of the largest grasses known The maize also abounds in sugar, and the same substance is secreted in such abundance by the Sórghum saccharátum, that attempts have actually been made in Italy to cultivate it as the sugar cane The creeping roots of grasses, which are generally mucilaginous and demulcent, are sometimes used in medicine, but they are of more importance for retaining in banks the sand of the sea shore, so as to form artificial cliffs on flat coasts, to restrain the inroads of the sea. The stems of Andropógon schænánthus, the leaves of Andropógon citrátum, the roots of Andropógon nárdus, and the whole plant of all the species of Anthoxánthum, exhale an aromatic odor, and possess slightly tonic properties To conclude, the epidermis of grasses has been found to contain a considerable quantity of silex

ORDER CLXXV CYPERACEÆ.

The sedges, as these may be called in English, differ from grasses not only in their comparative worthlessness, and the different development of the parts of fructification, but also in the sheath, at the base of the leaves, being closed up, not slit As objects of ornament they are of no value, and as subjects of agricultural interest of but little, they are, moreover, of little utility to man They are chiefly valuable for covering, with the appearance of herbage, waste, and barren, marshy, or sandy tracts, in which little else will thrive The roots of Cárex arenária, disticha, and hirta, possess diaphoretic and demulcent properties, whence they are sometimes called German sarsaparilla Some of the Scirpuses and Cypéruses have eatable nutty roots, the stems of Scirpus lacustris, Eleocharis palústris, Cyperus téxtilis, and others, are manufactured into mats and the bottoms of chairs, the roots of Cypérus esculéntus abound in oil, a very unusual circumstance, the papyrus of the ancients was manufactured from the stem of Cypérus papyrus, finally, the roots of Cyperus longus, odorátus, and others, are fragrant

74 **Cládium** *Schr*
119 **Schœnus** *Vahl*
120 **Rhynchospóra** *Vahl*

1947 **Cárex** *W*
1948 **Cobrésia** *W*
1949 **Uncínia** *Rich.*

ORDER CLXXVI AROIDEÆ

Herbaceous, stemless, or caulescent plants, with broad fleshy leaves, approaching very nearly to those of Dicotyledons Their flowers are enclosed within a spatha, and are imbedded on a simple cylindrical spadix Some are natives of Europe and of similar latitudes, but the greater number inhabit the tropics, where they often climb by their rooting stems to the tops of lofty trees They have thick fleshy roots, which, when fresh, contain an acrid stimulating principle, which is so volatile that it passes off freely upon the application of heat, whence the roasted roots of many species are among the most common articles of negro food The leaves of Arum seguinum are so paralyzing, that if chewed they deprive one of the power of utterance, whence in the West Indies it is called the *dumb cane*, the leaves of Dracóntium pertusum are acrid, fresh gathered, and applied all over the surface of the body, they produce a slight inflammation and blistering, and are used in Demerara, by the natives, in dropsical cases The root of Arum triphyllum, boiled in milk, has been found efficacious in consumption The flowers of many species are highly fetid Typhineæ, or bulrushes are very like Cyperaceæ in habit Pistiaceæ are floating plants, in which the organs of fructification are reduced to the very simplest state Juncagineæ are obscure marsh or river plants

854 Aponogéton *W* 317 Potamogéton *W*

ORDER CLXXVII FLUVIALES

With these the Vasculares and Monocotyledones terminate it has long been apparent that we have been descending in the scale of vegetation, and hence, the last order exhibited a structure the most simple of all vascular plants In the present order, Zostéra and Rúppia are so closely allied to Algæ, that they may be mistaken for them

24 Zostéra *L.* 318 Rúppia *W*

II. CELLULARES.

The characteristics of this division have already been explained in the preliminary observations upon the natural orders, and the remarks which were required for each natural order of Cellulares have already been given in Cryptogamia in the body of the work It has, therefore, been thought advisable to adopt from Professor Agardh such observations as he has made upon the orders, as a sort of contrast to those already given

CLASS I. FOLIACEÆ.

ORDER I FILICES

Of these the stem is perennial, often subterraneous and creeping, and occasionally becoming arborescent and leafy above the ground The fronds or leaves are usually pinnatifid, and more or less compound, sometimes nearly simple and entire, with reticulated veins The capsules are minute, one-celled, seldom many-celled, brown, membranous, and surrounded by a thick articulated elastic ring, irregularly bursting, and either clustered on the lower surface of the frond, or compound in spikes Their vernation is circinate, and some are propagated by bulbs The old botanists denied any fruit whatever to Ferns, believing the seeds of these plants to be so rare as to invest any body with invisibility who could collect them Afterwards, their capsules were believed to be their seeds Linnæus, and some others, doubted whether their fructification were seeds or pollen Finally, the experiments of Ehrhart and Lindsay proved, beyond all cavil, that they were really seeds As to the male organs nothing is known, some suppose them to be glands of the frond, others the elastic ring, some the indusium, and others the pores of the epidermis, lastly, Martius has supposed them to be the membrane including the spiral vessels Ferns are chiefly inhabitants of the torrid zone, becoming rarer as we approach the poles They delight in a humid soil, and they often grow parasitically upon trees The medicinal virtues of some are highly astringent, of others anthelmintic, of others purgative, some have acquired celebrity for their pectoral, others for their corroborant qualities The young leaves and roots of some constitute an article of food, beer is obtained from the roots of others, and, finally, Aspidium frágrans has been used as tea

Tribe 3. OPHIOGLOSSEÆ.

2208 Botrýchium *Swz* 2209 Ophioglóssum *L* 2210 Maráttia *Swz*

ORDER II. EQUISETACEÆ

Marsh plants, with a verticillate arrangement of their branches, and a highly indurated epidermis Their seeds are remarkable for a hygrometrical movement The quality of some is said to be hurtful to cattle which is denied by others Formerly they were used in medicine as astringents and diuretics Equisétum hyemále has been employed for tea, and as a polishing material for furniture, under the name of Dutch rushes

2211 Equisétum *L*

ORDER III LYCOPODINEÆ.

With the habits of mosses they have the seeds of ferns They are herbaceous prostrate plants, with imbricated simple leaves Lycopódium complanatum, Selágo, and clavátum as used as dyes, the sporules of Lycopódium clavátum are said to be employed for ameliorating wine, and are also used in making fire-works, on account of their inflammable nature The herb of Lycopodium clavátum and Selágo is emetic, and produces abortion Lycopódium phlegmária is reputed an aphrodisiac

2212 Lycopódium *L* 2213 Psilótum *Swz.*

ORDER IV MARSILEACEÆ

Floating or erect simple-leaved plants of no known use The Marsileas, which are to some countries what Lémna is to this, are not known in cultivation

2214 Isoétes *L* 2215 Pilulária *L.*

Class II. APHYLLÆ

Order V MUSCI

Winter plants, reviving in humid air, abundant about the poles, rare at the equator They cover the mountains of the earth as high as the limits of perpetual snow, growing in patches, they clothe the most barren spots with verdure, preserve trees from heat and cold, prepare the earth for nourishing more perfect plants, and fill up bogs and morasses with vegetable matter To the economy of nature they are, therefore, more subservient than to the purposes of man Medicinal astringent properties were formerly ascribed to some few, but they are now neglected or forgotten

2250 Læskea *Ehr*
2251 Hýpnum *L*

Tribe 3 Vaginulati Schistocarpi

2252 Andræ'a *Hedw*

Order VI HEPATICÆ

Creeping small plants, with their leaves arranged in an imbricated manner They differ from Lichens in structure, color, and fruit, from Musci, in the dehiscence of their capsule Their qualities are mild, if any, some of them are fragrant

2253 Junger mannia *L*
2254 Marchántia *Mich*
2255 Riccia *E B*
2256 Anthóceros *E B*
2257 Targiónia *E B*
2258 Sphærocarpus *L B*

Order VII ALGÆ

Plants ascending from the simplest form known in vegetation to a very compound state The lowest are filiform, leafless, with their fructification immersed, the highest are leafy, with the fructification included in an indehiscent wart-like pericarpium Some copulate like animals, others have a spontaneous motion like worms Their color is lively, in the lowest grades green, in the highest red or purple Some are ephemeral and microscopical, annual or perennial, and others extend to the length of many fathoms They grow at the bottom of the sea, or in fresh water, the depths of which they clothe with vegetation, as the higher orders of plants cover the earth with forests They grow on stems in the water only, or on each other Some exhale oxygen, others are scented like violets Their taste is mild, their substance gelatinous, membranous, or corticeous, usually covered externally with mucus The structure of the lowest is articulated, of the highest fibrous

Order VIII LICHENS

Lichens are not only most useful in the Œconomy of Nature, as preparing the surface of the earth for the reception of larger vegetables, but they are, moreover, of great utility to man Many, as Cetrária islándica, are eatable, having a bitter principle, and giving out a styptic tincture, if immersed in alcohol. Others, steeped in urine or salts, are used for dying, crustaceous species of this kind are Variolária orcina, Lecanóra tartárea, Leprária chlorina, &c., foliaceous species, Parmélia saxátilis, Sticta pulmonácea, Solorina crócea, Gyrophora deústa and pustulata, &c., and branched kinds, Roccélla tinctória (the common Orchal), Usnea plicáta, Alectória jubáta, and others In medicine, Cetrária islándica and nivális, Sticta pulmonacea, Alectória usneoides are tonic and nutritive, Parmélia parietína, Borréra purpurácea, Evérnia prunástri, &c., are astringent and febrifugal, Peltidéa aphthósa, anthelmintic, Evérnia vulpína, poisonous Some yield a gum, as Evérnia prunástri, Sticta pulmonácea may be employed for bittering beer instead of hops, and Ramalina

scopulorum instead of scap The various species give the grey hue to old walls and stones, cover desert heaths and mottle the bark of ancient trees

2363 Arthonia *Ach*
2364 Graphis *Ach*

ORDER IX FUNGI

We have now reached the lowest station of vegetable existence, in arriving where the vesicles which compose the vegetable fabric are combined in various forms, according to the contingent circumstances under which they are developed The mould on the cheese, the ergot of corn, the rust of the rose, and the huge Bolétus, which, in Java, spreads out its many-handed body from the trunks of ancient trees like a vegetating demon, differ only in the number of the vesicles of which they are composed Many species are eatable, as Agáricus campéstris, others are deadly, as Bolétus scáber, some are used medicinally, as Dædálea suaveólens in coughs, Agáricus túba reginæ in diarrhœa, Agáricus piperátus in calculous disorders, Phállus Mokúsin against cancer, Polypórus annósus against the bites of serpents Some Coprini are used for healing ulcers, Polypórus officinális as a purgative, Polypórus igniarius as a styptic, Polypórus destructor, and a number of others, constitute dry rot. For the poison of fungi, the roots of garlic, the leaves of parsley, and tincture of lacmus, are said to be remedies. so also is common spirit Fungi swarm in all the coldest countries of the world, but as we approach the equator they are extremely rare, the place where they most flourish is Sweden, and the adjacent regions

Tribe 1 HYMENOMYCETES.

§ 1 Hymenini

Div 1. *Pileati*

2365 Agaricus *L*
2366 Coprinus *Ik*
2367 Gomphus *Fries*
2368 Cantharellus *Adans*
2369 Merulius *Haller*
2370 Schizophyllum *Fries*
2371 Dædalea *Pers*
2372 Polyporus *Michels*
2373 Boletus *Dill*
2374 Fistulina *Bull*
2375 Hydnum *L*
2376 Sistostrema *Fries*
2377 Phlebia *Fries*
2378 Thelephora *Ehr*

Div 2. *Clavati*

2379 Clavaria *Vaill*
2380 Calocera *Fries.*
2381 Geoglossum *Pers*
2382 Spatularia *Pers*
2383 Mitrula *Fries*
2384 Typhula *Fries.*
2385 Pistillaria *Fries*

§ 2 Uterini *v* Elvellaceæ

Div 1. *Mitrati*

2386 Morchella *Dill*
2387 Helvella *L*
2388 Verpa *Swz*
2389 Leotia *Hill.*

Div 2 *Cupulati*

2390 Peziza *Dill.*
2391 Ascobolus *Pers.*
2392 Bulgaria *Fries*
2393 Ditiola *Fries*
2394 Cenangium *Fr*
2395 Stictis *Pers.*
2396 Cryptomyces *Fr*

§ 3 Tremellini

2397 Tremella *L.*
2398 Exidia *Fries.*
2399 Dacrymyces *Nees*
2400 Agyrium *Fr*
2401 Hymenella *Fr*
2402 Nematelia *Fr*

§ 4 Sclerotiacei

2403 Acrospermum *Tode*
2404 Sclerotium *Tode*
2405 Rhizoctonia *Dec*
2406 Peniola *Fr*
2407 Acinula *Fr*
2408 Erysibe *Rebentisch*

Tribe 2. GASTEROMYCETES.

§ 1 Angiogastres

Div 1 *Phalloideæ*

2409 Phallus *Mich*
2410 Batarrea *Pers*

Div 2 *Tuberaceæ*

2411 Tuber *Plin.*
2412 Rhizopogon *Fr*

Div 3 *Nidulariaceæ*

2413 Nidularia *Bull*
2414 Myriococcum *Tr*
2415 Polyangium *Lk*

Div 4 *Carpoboli.*

2416 Atractobolus *Tode*
2417 Thelebolus *Tode.*
2418 Pilobolus *Tode.*
2419 Sphæroboulus *Tode*

§ 2 Pyrenomycetes

Div 1. *Sphæriacei.*

2420 Xylaria *Hill*
2421 Stromatosphæ'ria *Grev.*
2422 Cucurbitaria *Gray*
2423 Cryptosphæ'ria *Grev.*
2424 Heterosphæria *Grev.*
2425 Sphæ'ria *Haller.*
2426 Lophium *Fries*

Div 2. *Cytisporei.*

2427 Sphæronæ'ma *Fries* 2428 Septária *Fries* 2429 Cytispóra *Ehr* 2430 Phóma *Fr*

Div 3. *Phacidiacei*

2431 Dothidéa *Tr.* 2432 Rhytisma *Fries* 2433 Phacidium *Fries* 2434 Hystérium *Tode*

2496 Cylindrospórium *Grev* 2497 Urédo *Pers.* 2498 Æcídium *Pers.* 2499 Puccínia *Mich.*

After the most perfect classification which the present state of botanical knowledge renders practicable, there still remain a few genera which are incapable of having their true station assigned to them, either in consequence of their structure being incompletely known, or of their affinity not having yet been discovered As far as this work is concerned, they are the following, all of which are Dicotyledones.

1965 Aúcuba *W* 1462 Aitónia *W.* 2121 Nepénthes *W.*
405 Bréxia *Nor* 2068 Antidésma *W* 2163 Laurophyllus *W*
442 Vallésia *Fl per* 2098 Eúclea *W.* 1986 Ceratophýllum *W.*

GLOSSARY

OF

TERMS USED IN THE GENERIC AND SPECIFIC DESCRIPTIONS, IN THE GENERAL OBSERVATIONS ON THE CLASSES, AND IN THE NOTES.

The figures between parentheses ( ) refer to the engravings at the bottom of the page
After each term a reference is given to an example of its application in the body of the work: in these references, g signifies genus, s species, p. page

A

A, in composition, signifies without, as *Aphyllus*, without leaves; *Acaulis*, without stem s 1330

Abbreviate (*abbreviare*, to shorten) Used in comparative descriptions, to indicate that one part is shorter than another Sálvia crassifólia, s 420

Aberrant, deviating from the natural or direct way; applied in Natural History to species or genera that deviate from the usual characters of their neighbours p 408

Abortion (1) signifies an imperfect developement of any given organ Cephaláuthus, g 275 p 78

Abraded, rubbed or worn off Acácia, g 2127 (note)

Abstergent, cleansing, having a cleansing quality Sapindus, g 926 (note)

Accessory, something added to the usual number of organs, or their parts Phálaris, g 168 p 32

Accretion, the growing of one thing to another p 748

Accumbent, lying on, prostrate, supine, this term is employed in Cruciferæ, to signify a radicle, which lies upon the edge of the Cotyledons p 536

Acerose, (2) needle-pointed, fine and slender, with a sharp point Bánksia pulchélla, s 1449

Accescent, sour, tart, acid Pinguícula, g 52 (note)

Acetarious, any thing belonging to the salad tribes of vegetables Lactúca, g 1628 (note)

Acetous, something that produces acidity Triticum, g 206 (note)

Acicular, (3) needle-shaped Leptospérmum triloculáre, s 6651

Acinaciform, (4) scimitar-shaped Ehrhárta, g 754 p 298

Acini, the small stones in grapes, strawberries, &c Cecropia, g 2043 (note)

Aculeate, (5) being furnished with aculei or prickles, as distinguished from spines Spartina polystachya, s 920

Aculei, prickles, sharp hard processes of the epidermis falling off when old, by which character they are distinguished from spines, which do not fall off Medicágo múrex, s 10910

Acuminate, (6) taper-pointed Cánna índica, s 2

Acutangular, (7) having sharp angles Corchorus acutángulus, s 7722

Adnate, (8) adhering to a thing Anthers are called adnate when they are attached to the filament by their whole length Anthoxánthum amárum, s 498

Adult, the full-grown of any thing full-grown leaves are adult leaves Prótea obtúsa, s 1318

Æruginous, having a color like that of ærugo or verdigris Curcuma æruginósa, s 82

Agglomerated, collected in a heap or head Æcídium Jacobææ, s 10669

Aggregate, (9) gathered together, usually applied to a dense sort of inflorescence Calyméria aggregáta, s 570

Agrumi, a name given by the Italians to any kind of lemons or oranges Citrus, g 1615 (note)

Akenium, (10) a hard pericarpium, containing a single seed, which does not adhere to it, it is the same as the Linnæan *nux* Hippophaë, g 2058 p 817

Albumen, the substance under the inner coat of the testa, surrounding the embryo, it is sometimes absent Réseda, g 1102 (note)

Alembick, a vessel used in distilling, or acting like a still Phœnix, g 2049 (note)

Alexipharmic, that which counteracts poisons, antidotal Maránta, g 2 (note)

Alexiteric, having the power of doing away poisons p 1065

Alkalescent, having the properties or effects of alkali Rúmex acetósa, g 856 (note)

Alkali, any substance which, when mingled with acid, produces fermentation Viola, g 540 (note)

Alveolate, (11) resembling a honeycomb Borkhaúsia, g 1637 p 661

Alvine, of or belonging to the intestines. Acácia, g 2127 (note)

Amentum, (12) a catkin, mode of inflorescence Aponogéton, g 854 p 240

Amplexicaul, (13) stem-clasping, the base of the leaf surrounding the stem Céstrum auriculátum, s 2465

Amylaceous, having the properties of starch p 1065

Anastomosing, (14) uniting, or inosculation, of vessels Cinchiótus, g 2227 p 896

Androgynous, producing both male and female sexes on the same root, or in the same flower. Uncínia, g 1949 p 758

Anfractuose, full of turnings and winding passages Ochróma, g 1458 p 560

Angular, (15) composed of, or furnished with, angles. Lopézia coronáta, s 105

Angulo dentate, (16) angularly toothed, or angular and toothed Lapsána communis, s 11324

Annulations, (17) rings or circles Rivulária, g 2270 p 925

Anterior, growing in front of some other thing Hákea acanthophylla, s 1434

Anthelmintic, capable of killing worms Geoffróya, g 1517 (note)

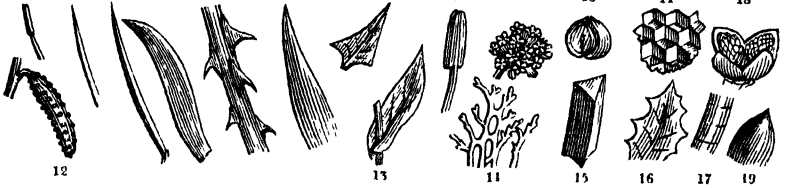
Antheriferous, (18) bearing anthers Lopézia, g 18 p 1

Antaphrodisiacal, any thing which checks the desire of sexual intercourse Vitex, g 1317 (note)

Anti-pestilential, efficacious against pestilence Angélica, g 664 (note)

Antiphrasis, the use of words in a sense opposite to that of some neighbouring parallel sentence Globulária, g 260 (note)

Anti-scrophulous, antiscorbutic, efficacious against scurvy Cynoglóssum, g 336 (note)



Antiseptic, efficacious against putrefaction Artemísia, g 1721 (note)

Aperient, having a slight purgative quality Curcuma, g 14 (note)

Apetalous, being without petals p 1

Apex, (19) the summit, generally applied to any thing terminating in a point Thália dealbáta, s 26

Aphrodisiacal, any thing which excites a desire for sexual intercourse. Justicia, g 47 (note.)

Aphthous, resembling something covered with little ulcers Acácia, g 2127 (note)

Apiculate, (20) terminating in an apiculus or little point Rósa microphýlla, s 7512

Apiculus, (21) a small point This term is generally used when the midrib projects beyond the leaf, forming a little point, or when a small point is very suddenly and abruptly formed Portula unguiculáta, s 14757

Apophysis, (22) a swelling beneath the theca of a moss Spláchnum, g 2231 p 896

Appendix, (23) that which is attached Sarracénia rúbra, s 7675

Appense, being hung up as a hat is upon a pin, an approach to pendulous Piménta, g 1123 p 400

Appressed, placed close upon something else, when hairs lie flat upon the surface of a plant, they are said to be appressed Stachytárpheta hirsutíssima, s 337

Approximated, near together Sálvia trunciáta, s 445

Apterous, without wings, or the membranous margins which botanists call wings Pinguícula, g 52 (note)

Aquatics, growing in or belonging to water p 1

Arborous, being a tree, as distinguished from frutescent or shrubby Pelargónium discípes, s 9633

Arborescent, having a tendency to become a tree Piper tomentosum, s 517

Arcuate, curved or bent like a bow Hypécoum procumbens, s 1815

Areolæ, (24) little spaces or areas on the surface of a thing the surface of crustaceous lichens is often cracked in every direction, the spaces between the cracks are the areolæ Lecidéa coracina, s 15378

Areolated, the adjective of the last term Solenia, g 2407 p 925

Aridity, dryness Xerótes, g 2076 (note)

Arillate, having that peculiar appendage called the Arillus The term is only applied to seeds p 751

Arillus, (25) a process of the placenta adhering to the hilum of seeds, and sometimes enveloping them Phrýnium, g 5 p 1

Aristate, bearded, as the glumes of barley Many grasses

Aroma, the spicy quality of a thing Justícia, g 47 (note)

Articulation, the place where one thing is joined with another, another word for joint Coryníphorus, g 369 (note)

Asci, (26) small tubes in which the sporules of Cryptogamic plants are placed p 978

Ascigerous, having asci p 982

Assurgent, rising upward Phlox amœna, s 2113

Attenuate, made thin or slender Lopézia racemósa, s 102

Auriculated, (27) having an ear-like base Jasminum auriculátum, s 174

Awns, the beard or arista of corn Salsóla muricáta, s 3404

Axil-flowering, flowering in the axilla Chionánthus axillária s 154

Axilla, literally the armpit, in plants applied to the angle formed by the union of the leaf and stem Dipsácus, g 202 (note)

Axillary, (28) placed in the axilla Pollíchia campéstris, s 113

Axis, the line, real or imaginary, that passes through any thing. Actinocárpus, g 860 (note)

B

Baccate, berried, having a fleshy coat or covering. Gmélina, g 1311 p 493

Bagged, resembling a bag or sack Ceanóthus, g 510 p 113

Ball, (29) the round central part of the flower of the Stapélia p 109

Bands, (30) or vittæ, are the spaces between the elevated lines or ribs of the fruit of umbelliferous plants Bubon, g 640 p 116

Barred, crossed by a paler color in spaces resembling bars Sanseviéra planci, s 1540

Beak, any thing which resembles the beak of a bird, hard short points Briza, g 195 p 53

Bearded, having long hair like a beard Wulfénia, g 50 p 9

Beardless, having small awns Cinna arundinácea, s 1010

Bicuspidate, (31) twice pointed Cárex lagopodioides, s 13081

Bidentate, (32) double-toothed, or having two teeth Alantódia axillaris, s 14527

Biennial, a plant is said to be biennial which requires two seasons to mature its fruit, and then dies Phílydrum, g 17 (note)

Bifarious, (33) placed in two rows Alpínia tubuláta, s 50

Bifid, (34) half divided in two, two cleft. Cánna lútea, s 4

Biglandular, double-glanded Malpighia glandulósa, s 6574

Bilabiate, (35) having two lips Dichptera, g 48 p 9

Bilobed, (36) divided into two lobes Oxalis filicaúlis, s 6618

Binate, growing two together Córnus suécica, s 1701

Bipartible, capable of being parted in two Prótea, g 231 p 77

Bipinnate, (37) a mode of foliation, twice pinnate Petrophila pulchella, s 1306

Bipinnatifid, (38) twice pinnatifid, a mode of foliation Verónica Jacquini, s 238

Bisaccate, having two little sacks, bags, or pouches Mathiola, g 1381 p 550

Biscutate, (39) resembling two bucklers (scuta) placed side by side Biscutélla, g 1413 p 537

Biternate, (40) divided in three twice over Chærophýllum Clavtoni, s 3491

Bi-tri-crenate, crenate twice or thrice Jungermánnia pusilla, s 14058

Bi-tri-pinnatifid, pinnatifid twice or thrice over Petrophila diversifolia, s 1407

Bi-tri-ternate growing in threes twice or thrice over Actæa americana, s 7649

Bivalved, two-valved p 877

Blanching, made white by being grown in a dark place Lactuca, g 1628 (note)

Bland, fair, beautiful Mesembryanthemum blándum, s 7148

Blight, a vague term, signifying a pestilence among plants caused by the attack of insects or of parasitical fungi, or by some endemical affection of the atmosphere Humulus, g 2074 (note)

Blistered, having the surface raised as the skin is when blistered Sálvia microphýlla, s 393

Bole, trunk of a tree Ornus, g 69 (note)

Boraginous, of or belonging to the natural order Boragineæ Rhexia, s 900 (note)

Brachiate, (41) having arms or branches usually placed opposite to each other, nearly at right angles with the main stem, and crossing each other alternately Phillyréa angustifolia, s 143

Bracteate, furnished with bracteæ p 445

Bracteola, little bracteæ Geropogon, g 1620 p 661

Bracteæ, (42) small leaves placed near the calyx Maránta obliqua, s 19

Branchlets, small branches Agróstis vulgaris, s 993

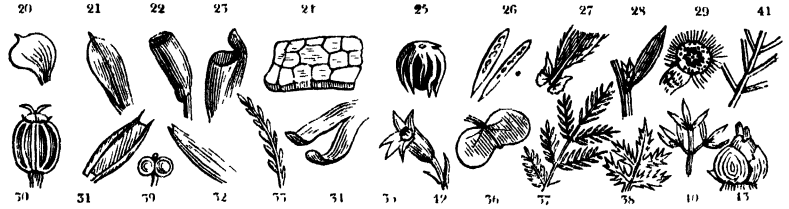
Bristles, rigid hairs Ornus, g 69 p 10

Bulbiferous, bulb-bearing Globba marantina, s 9b

Bulbous, having bulbs Cyperus, g 127 p 31

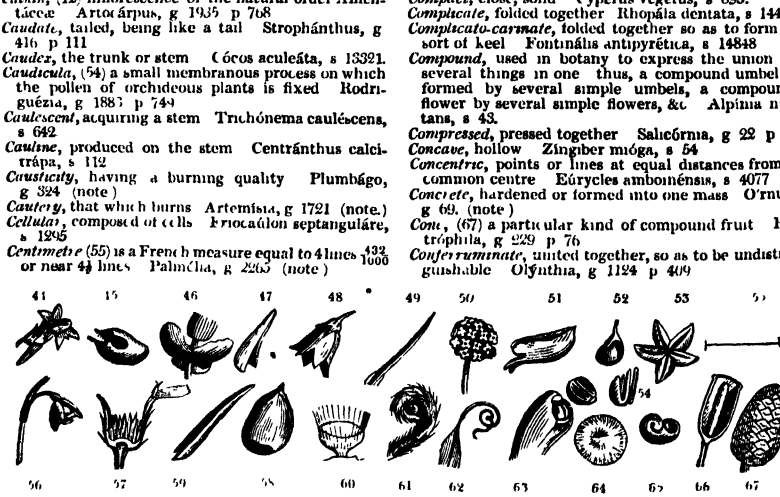
Bulbs, (43) underground buds resembling roots, and consisting of numerous fleshy scales placed one over the other Allium, g 795 p 272

Burry, covered with hooked stiff hairs, like the heads of Bur or Burdock Pisónia, g 864 (note)



Byssoid, having the appearance of Byssus p 979

C



Caducous, falling off soon Epimédium, g 297 p 79

Cæsious, grey Curcúma cæsia, s 84

Cæspitose, growing in little tufts Ermus alpínus, s 8825

Calcarate, (44) spurred, or spur-shaped Alpínia cardamómum, s 48
Calcareous, chalky, or growing on chalk O'lea, g 32 (note)
Calceiform, (45) formed like a little shoe Pedilánthus, g 1104 p 393
Calli, small callosities, or rough protuberances Sálvia amarissima, s 397
Callous, hardened Brúnia ericoides, s 3005
Calycine, of or belonging to a calyx Cartonéma, g 90 p 20
Calyculated, (46) having bracteolæ resembling an external or additional calyx Myoseris, g 1640 p 661
Calyptra, (47) literally an extinguisher, applied to the body which tips the theca of a moss, and the like p 895
Calyptrate, having a covering resembling an extinguisher Erica coarctáta, s 5330
Calyptrate, having a calyptra Actinophýllum, g 697. p 117
Calyptriformis, shaped like a calyptra Marcgraávia, g 1163 p 456
Campanulate, (48) bell-shaped Cóstus, g 11 p 1
Canaliculate, channelled or furrowed Weissia acúta, s 14714
Cancellate, latticed, resembling lattice-work Trigonella cancellata, s 10882
Canescent, hoary, approaching to white Selágo canéscens, s 8662
Capillary, (49) very slender, resembling a hair Trichophorum, g 126 p 31
Capitate, (50) growing in a head Chloránthus, g 25 p 1
Capitulate, growing in small heads. Brýum, g 2240 (note)
Capitula, small heads Réseda, g 1102 (note)
Capituliform, formed like a small head Cenomýce, g 2449 p 949
Carbonised, burned to a coal Quércus súber, g 2000 (note)
Carina, (51) a keel like that of a boat, also the two lower petals of papilionaceous flowers Pongámia, g 1514 p 568
Carinate, keel-shaped Utriculária minor, s 329
Cariopsis, (52) a one-celled, small, indehiscent pericarpium adhering to the seed which it contains, as the grain of grasses Hydrástis, g 1241 p 459
Carious, decayed Juniperus, g 2113 (note)
Carminative, medicines which promote perspiration Pimpinélla ánisum, s 5562
Carnose, fleshy Gymnostomum Griffithsiánum, s 14671.
Carpella, (53) the small parts out of which compound fruit are formed Actinocárpus, g 860 (note)
Carpology, the science which treats of the structure of fruits and seeds p 1056
Cartilage, gristle Róchea odoratissima, s 3868
Cartilaginous, gristly Asparágus, g 29 p 1
Cataplasm, a plaster, or more properly a poultice Zingiber, g 10 (note)
Catarrhal, of or belonging to a cold Acácia, g 2127 (note)
Cathartic, purgative Gratiola, g 43 (note)
Catkin, (12) inflorescence of the natural order Amentáceæ Artocárpus, g 1935 p 708
Caudate, tailed, being like a tail Strophánthus, g 416 p 111
Caudex, the trunk or stem Cócos aculeáta, s 13321.
Caudicula, (54) a small membranous process on which the pollen of orchideous plants is fixed Rodriguézia, g 1883 p 749
Caulescent, acquiring a stem Trichónema cauléscens, s 642
Cauline, produced on the stem Centránthus calcitrápa, s 112
Causticity, having a burning quality Plumbágo, g 324 (note)
Cautery, that which burns Artemísia, g 1721 (note.)
Cellular, composed of cells Eriocaúlon septangulare, s 1295
Centimetre (55) is a French measure equal to 4 lines $\frac{432}{1000}$ or near 4½ lines Palmélla, g 2265 (note)
Centuriæ, hundreds Buxbaúmia, g 2236 (note)
Cephalic, medicinal to the head Kæmpféria, g 12. (note)
Ceraceous, wax-like Pezíza erúmpens, s 16273
Cernuous, (56) nodding, drooping, or pendulous Cánna iridiflóra, s. 17
Chaffy, (57) bearing processes resembling chaff. Eriophorum, g 125 p 31
Chalaza, (58) a spot on the seed, indicating where the vessels of the raphe terminate. Eriobótrya, g 1137 p 409
Channel-leaved, (59) folded together so as to resemble a channel for conducting water Trichonéma bulbocódium, s 640
Charlatanry, quackery Mandragóra, g 447 (note)
Charring, blackening by fire Quércus, g 2000 (note)
Chlorosis, the green sickness, a disease so called Anthemis, g 1778 (note)
Cilia, (60) hairs like those of the eyelash Plantágo subulata, s 1707
Ciliary processes, like eyelash hairs p 907
Ciliated, eyelash-haired Lopézia cordáta, s. 104
Ciliato-dentate, toothed and fringed with hairs like eyelashes Cactus heterophyllus, s 11405
Cinereous, ash-colored, grey Grevillea cinérea, s 1417
Cingalese, inhabitants of, or belonging to, Ceylon Plumbágo zeylanica, s 1861
Circinately, (61) curled round like a sharp crook p 539
Cirriferous, bearing tendrils Gloriósa superba, s 4574
Cirrhose, or *Cirrhous*, (62) tendrilled Bignónia únguis, s 8551
Clammy, viscid, sticky Boerhaávia viscósa, s 109
Clathrate, latticed, divided like latticework Solánia compréssa, s 15270
Clavate, club-shaped Curcúma comósa, s 85
Clavellose, clubbed, or having club-like processes Chóndria clavellósa, s 15290
Clavus, a name for the ergot, a disease in corn Festúca duriuscula, g 182 (note)
Claws, (269) the taper base of a petal Cánna limbáta, s 8
Clinandrum, (63) that part of the column of orchideous plants in which the anther lies Listéra, g 1876 p 749
Clypeate, (64) shaped like a Roman buckler. Tupístra, g 757 p 298
Cobwebbed, covered with loose hairs, as if with a cobweb Anacámpseros arachnoides, s 6630
Cochleate, (65) resembling the shell of a snail Rhéxia, g 900 p 300
Cohering, connected Protea, g 231 p 77.
Collapsion, the act of closing or falling together. Sphæria hydróphora, s 16436
Columella, (66) the axis of the fruit of mosses p 874
Columnar, formed like columns Pæonia tuciata, s 623
Comminuted, pulverised or pounded Linum, g 701 (note)
Cosmose, this term is used to express a kind of inflorescence, which is terminated by sterile bracteæ Maránta comósa, s 24
Compact, close, solid Cyperus vegétus, s 895.
Complicate, folded together Rhopála dentata, s 1447.
Complicato-carinate, folded together so as to form a sort of keel Fontinális antipyrética, s 14848
Compound, used in botany to express the union of several things in one thus, a compound umbel is formed by several simple umbels, a compound flower by several simple flowers, &c Alpínia nutans, s 43.
Compressed, pressed together Salicórnia, g 22 p 1
Concave, hollow Zingiber mióga, s 54
Concentric, points or lines at equal distances from a common centre Eúrycles amboinénsis, s 4077
Concrete, hardened or formed into one mass O'rnus, g 69. (note)
Cone, (67) a particular kind of compound fruit Petrophila, g 229 p 76
Conferruminate, united together, so as to be undistinguishable Olynthia, g 1124 p 409

Confervoid, like confervæ. Sporóchnus, g 2321 o 926.

Confluent, running into one another Jasminum grandiflórum, s 181

Conglobated, collected into a spherical form. Dacrymyces morifórmis, s 16300

Conical, (68) resembling a cone Hedýchium heteromállum, s 16300.

Conico-hemispherical, (69) between conical and round Brýum cuspidátum, s 14830

Conico-ovate, (70) between conical and ovate. Pinus sylvéstris, s 13302.

Conjugate, (71) joined in pairs a term chiefly applied to leaves Piper cuneifólium, s 524

Connate, (72) joined together at the base Calceolária parálii, s 320

Connivent, (73) converging Lœflíngia, g 82. p 30.

Conoid, cone-like Silène conoídea, s 6223

Constricted, (74) tightened or contracted in some particular place Salix lanceolata, s 13691

Converging, approaching together. Datúra férox, s 2164

Convex, rising in a circular form Piper rubéllum, s 543

Convexo plane, plane on one side, convex on the other Cárex vulpina, s 13384

Convolute, (75) rolled together Crócus, g 93 p 30

Coralloid, like coral Chóndria kalifórmis, s. 15291

Cordate, heart-shaped Canna variábilis, s 9

Coriaceous, leathery Chionánthus virginicus, s 152

Corneous, horny, of the consistence of horn Sphærocóccus córneus, s 15301

Corniculate, having processes like small horns. Mesembryánthemum procumbens, s 7251

Cornute, horned Eucalýptus cornúta, s 7003

Corona, (76) literally a crown applied in botany to the crown-like cup which is found at the orifice of the tube of the corolla in Narcissus, Pancrátium, and others Brodiǽa, g 114 p 31

Corpuscle, a small body, a particle of any thing Scamóne, g 577 p 114

Corroborant, strengthening, having the power to give strength Melíssa, p 1278 (note)

Corrosive, having the power of wearing away Sapindus, g 926 (note)

Corrugated, wrinkled or shrivelled Paspalum stoloníferum, s 926

Cortical, of or belonging to the bark Línum, g 701 (note)

Corymb, (77) a raceme or panicle in which the stalks of the lower flowers are longer than those of the upper, so that the flowers themselves are all on the same level Centránthus rúber, s 110

Corymbose, formed or arranged after the manner of a corymb Lopézia coronáta, s 103

Corymbulose, formed or arranged in many small corymbs Crássula corymbulósa, s 3887

Cosmetic, beautifying Dipsacus, g 262 (note)

Costæ literally ribs applied by botanists sometimes to the midrib of a leaf, and sometimes to any projecting round elevations having the same direction as the axis of the fruit Morchélla, g 2386 (note)

Costate, ribbed Jungermánnia furcáta, s 15004

Cotyledons, (78) seed leaves Hórdeum, g 210 (note)

Cowled-leaved, a thing is said to be cowled or cucullate when its end is curved inwards in such a manner as to represent the cowl or hood of a monk Lachenália bifólia, s 4898

Crenæ, notches Saxífraga umbrósa, s 6063

Crenate, (79) notched Cánna limbáta, s 8

Crenature, the notching Prasium mínus, s 8518

Crenulate, full of notches Sálvia pomífera, s 370

Crest, (80) applied to some elevated appendage terminating a particular organ a stamen is crested when the filament projects beyond the anther, and becomes dilated Kæmpféria, g 12. p 1.

Cribriform, riddled with holes like a sieve Peziza cribrósa, s 16265

Cribrose, perforated like a sieve Parnárium, g 870 p 297

Crisp, when leaves are very much undulated at the margin, they are called crisp or curled. Céstus villosíssimus, s 66.

Cruciate, (81) shaped like a Maltese cross: a flower is said to be cruciate when four equal petals are placed opposite each other at right angles. Gentiána septémfida, s 3360

Cruciferous, the name of a particular family of plants bearing cruciate flowers p 536.

Crustaceous, having a hard brittle shell Helléria, g 9 p 1

Crystalline, consisting of, or resembling, crystals Mesembryánthemum lanceolátum, s 7382

Cucullate, (82) hooded, cowled, see *Cowled* Calathéa, g 3 p 1.

Culm, the stem of grasses, scitamineous plants, and the like Maránta arundinácea, s 18

Culmiferous, producing culms Triticum spélta, s 1235

Cultrate, (83) shaped like a pruning-knife Crássula cultrata, s 3880

Cuneate, wedge-shaped Teúcrium cubénse, s 8117.

Cup, the same as corona, see that word, g 711. p 236

Cupule, (84) the cup of an acorn, and of all amentaceous plants p 1017

Cupuliform, or ***Cupulate***, shaped like a reversed bell p 982

Cuspidate, (85) like the point of a spear, a leaf is cuspidate, when it is suddenly tapered to a point. Tritónia rósea, s 664

Cutaneous, relating to the skin Scabiosa, g 264. (note)

Cuticle, the scarf skin, or epidermis Chára, g 2295 (note)

Cut-toothed, (86) cut and toothed at the same time. Plantágo macrorhíza, s 1708

Cyathiform, cup-shaped, concave Narcíssus pulchéllus, s 4025

Cylindraceous, having the form of a cylinder Dicránum Scottiánum, s 14724

Cylindrical, cylinder-shaped Salicórnia rádicans, s 116

Cylindrico-campanulate, cylindrically bell-shaped Encalýpta, g 2222 p 896

Cymbiform, (87) boat-shaped Vallísia glábra, s 2456

Cyme, (88) a mode of inflorescence, resembling a flattened panicle Scirpus lacústris, s 801

Cymose, flowering in cymes Róchea cymósa, s 3866.

D

Decandrous, having ten stamens Phytolácca abyssínica, s 6573

Deciduous, falling off Leaves which are shed annually are said to be deciduous as are also trees that annually lose their leaves Olea excélsa, s 141

Declinate, curved downwards Zingiber zerúmbet, s 56

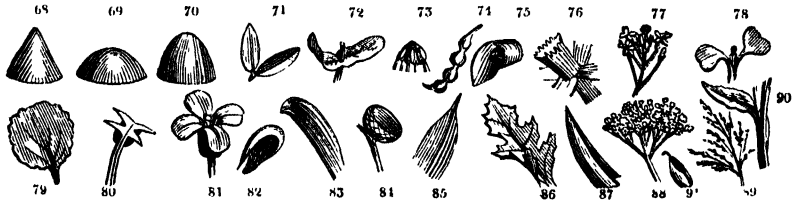
Decoction, a preparation or digest by boiling water Cúnila, g 58 (note)

Decompound, (89) a leaf is said to be decompound when it is twice pinnated, a panicle when its branches are also panicled Linociéra compácta, s 474

Decorticated, disbarked. Amygdalus, g 1128 (note)

Decumbent, lying down Chloránthus inconspícuus, s 121

Decurrent, (90) running down Lopézia coronáta, s 103



Decursive, having a tendency to run down Actinótus helánthi, s 3591

Decussated, when two right lines cross each other at right angles they are said to decussate, leaves are often placed in this position Ixóra parviflóra, s 1746

Deflexed, turned downwards. Schizánthus pinnátus, s 272

Dehiscent, (91) gaping, an expression applied to the mode in which the anthers or the fruit burst open and discharge their contents p 896

Delsquescent, melting away upon exposure to air p 979

Delta-leaved, Deltoid, (92) shaped like the Greek Δ Mesembryánthemum, g 1146 p 437

Demulcent, having the property of softening any thing Málva, g 1472 (note)

Dentate, (93) having the margin divided into incisions resembling teeth Veronica acúta, s 196

Dentato-ciliate, having the margin dentate and tipped with cilia Sonchus arvénsis, s 11106

Dentato-sinuate, (94) scolloped and toothed Hypochæ'ris glabra, s 11319

Denticulate, being finely dentate Circæ'a lutetiana, s 487

Denticulations, small toothings Bossiæ'a scolopéndrium, s 10121

Dentiform, tooth-shaped Barbaréa plantagínea, s 8980

Dentifrice, powder made to scour the teeth Acácia, g 2127 (note)

Deobstruent, having the power of removing obstructions, a term of medicine Agrimonia, g 1101 (note)

Dependent, hanging down Moræ'a spathácea s 826

Depressed, pressed downward Thália, g 4 p 1

Depurated, purified, cleansed Oxalis, g 1065 (note)

Despumate, to throw off in froth or scum Cecrópia, g 2043 (note)

Detergent, Detersive, having the power of cleansing Physalis, g 448 (note)

Diandrous, having two stamens Boerhaávia hirsúta, s 107

Diaphanous, transparent. Encalýpta ciliáta β alpína, s 14685

Diaphoretic, promoting perspiration Sambucus, g 680 (note)

Dichotomous, (95) a stem that ramifies in pairs Phrýnium dichotomum, s 28

Dicoccous, having two cocci p 78

Didymous, two united Príva mexicána, s 8675

Didynamous, (96) having two long stamens and two short ones in the same flower, each pair being oblateral. Stenochilus, g 1033 p 403

Dietetics, relating to food or diet Sáccharum, g 210 (note)

Difform, two forms, used to express irregularity Anacámpseros rotundifólia, s 6629

Diffuse, scattered, widely spread Verónica saxátilis, s 220

Diffusible, such as may be spread Amýgdalus, g 1128 (note)

Digitated, (97) fingered, shaped like the hand spread open Veronica digitata, s 255

Digitiform, formed like fingers Mesembryanthemum incomptum, s 7408

Digynous, two styles or female organs Sálvia crética, s 401

Diluent, something diluting Melissa, g. 1278 (note)

Dimidiate, (98) halved, divided into two parts p 89

Dioecious, when a plant bears female flowers on one individual, and males on another, it is called dioecious Valeriána dioica, s 544

Discoid (99) When in Compositæ the florets are all tubular, the head of flowers is said to be discoid In other cases, when the florets of the centre of a head of flowers are more perfect than the rest, they are called discoid Finally, when any thing is dilated into something which may be compared to a disk, the term discoid is also made use of Valerianélla discoídea, s 563

Discus, or *Disk,* the fleshy annular process that surrounds the ovarium of many flowers also the surface of a leaf, also the centre of a head of flowers of Compósitæ Ænópha, g 504 p 113

Discutient, having the power to scatter the matter of tumours Artemisia, g 1721 (note)

Dissepiment, (100) the partitions by which a seed vessel is divided internally Elytrária, g 45 p 9

Distichous, (101) two rowed producing leaves or flowers in two opposite rows Schœ'nus, g 119 p 31

Districhotomous, (102) divided in twos or threes, a stem continually dividing into double or treble ramifications Trichódium canínum, s 1001

Diuretic, having the power of promoting the flow of urine Bromélia, g 726 (note)

Divaricate, growing in a straggling manner Verónica pinnáta, s 219

Dodecandrous, having twelve stamens Rivina dodecándra, s 1511

Dolabriform, (103) axe-shaped Stizolóbium, g 1551 p 599

Dorsal, growing on the back Kæmpféria rotúnda, s 67

Drastic, applied to medicines which act violently Dictamnus, g 997 (note)

Drupe, (104) a kind of fruit consisting of a fleshy succulent rind, and containing a hard stone in the middle Olea, g 52 p 9.

Dyspepsia, difficulty of digestion Artemísia, g 1721 (note)

E.

Echinated, (105) covered with prickles like an echinus or hedgehog Amómum subulátum, s 79

Edible, eatable Eleusine, g 200 (note)

Effuse, (106) literally poured forth, applied to inflorescence, it means a kind of panicle with a very loose one-sided arrangement Juncus effúsus, s 4327

Electuaries, a medicine of conserves and powders in the consistence of honey Prunus doméstica, s 7045

Elephantiasis, a disease in which the limbs become prodigiously swollen and finally fall off Smilax, g 2081 (note)

Elliptoid, (107) like an ellipsis Nastúrtium amphíbium, s 8970

Elliptic-lanceolate, (108) a form between elliptical and lanceolate Olea americána, s 140

Elongated, lengthened Cánna gigantéa, s 6

Emarginate, (109) having a small notch in the end Canna coccínea, s 3

Embossed, (110) projecting in the centre like the boss or umbo of a round shield or target Prótea umbonális, s 1327

Embracing, (13) a leaf is said to embrace a stem when it clasps it round with its base Salvia amplexicaúlis, s 428

Emetic, that which produces vomiting Primula vulgáris, s 2020

Emmenagogue, any medicine that promotes menstruation Ligusticum, g 665 (note)

Emollient, softening Trumfetta, g 1087 (note)

Emulsions, medicines made of bruised oily seeds and water Amýgdalus, g 1128 (note)

Ensate, or *Ensiform,* (111) shaped like a sword with a straight blade Aloe cándicans, s 4444

Epidermis, the outer skin of the bark. Latrus, g 934 (note)

Epiphyllous, (112) growing upon a leaf Jungermannia epíphylla, s 15003

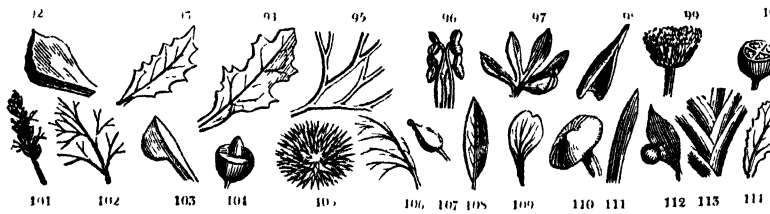
Epiphytes, plants which grow upon other plants without deriving any nutriment from them Catasétum, g 1889 (note)

Equidistant, equally distant Ægopódium, g 652 p 116

Equilateral, having equal sides Aloe reticulata, s 4392

Equitant, (113) a mode of vernation, or of arrangement of leaves with respect to each other, in which the sides or edges alternately overlap each other Moræ'a iridioides, s 827

Erecto-patent, between erect and spreading Dictamnum glaucum, s 14715



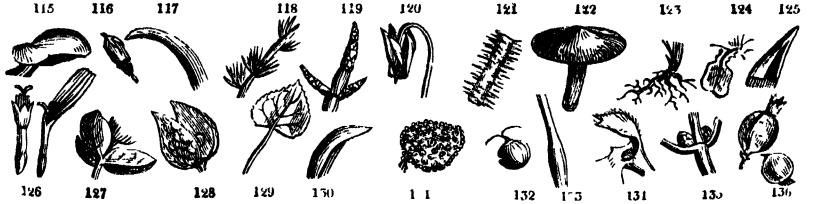
Eroded, (114) gnawed, bitten, a term used to express a particular kind of irregular denticulation Salvia pinnáta, s 377

Erosa-dentata, the toothing being eroded Lycopódium clavátum, s 14632

Errhine, promoting a discharge of mucus from the nostrils Asarum, g 1072 (note)

Escharotic, having the power to scar or burn the skin Juniperus, g 2113 (note)

Esculent, good for food Oxystélma esculéntum s 3226



Estuaries, arms of the sea, mouths of a river Polygonum amphíbium, s 5568
Etiolated, whitened by being kept from air and light. Triticum spélta, p 70 (note)
Evanescent, quickly vanishing Heráclеum, g 672 p 117
Evolved, unfolded Aneuléma, g 80 (note)
Excavated, hollowed out Borágo, g 340 p 109
Excentrical, (115) flying off from the centre Agáricus ulmárius, s 15924
Excoriate, stripped of the bark or skin Broméliа Karátas, g 726 (note)
Excurrent, projecting or running beyond the edge or point of any thing. Tórtula subulàta, s 14751.
Exotic, foreign. p 1
Expectorant, any thing that promotes the discharge of mucus from the chest Sambúcus nigra, p 225 (note)
Exserted, (116) projecting beyond something else Jasminum revolutum, s 179
Exsuccated, dried up Papáver, g 1170 (note)
Extra-axillary, above or on the outside of the axils Mesembryánthemum, g 1146 (note)
Extra-foliaceous, away from the leaves, or inserted in a different place from them Echites bispinósa, s 2460
Exuvia, whatever is cast off by plants or animals Cactus, g 1111 (note)

F

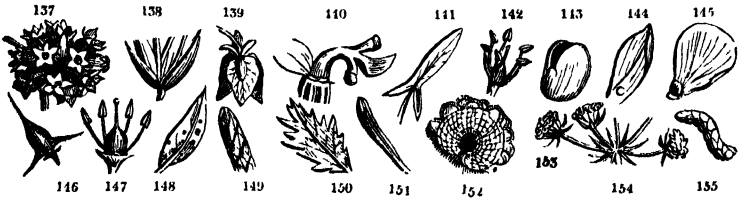
Fecula, the nutritious powder of wheat or of other things Codárium, g 30 p 8
Falcate, or *Falciform*, (117) bent like a sickle Dactylóctenium, g 201 p 33
Falcato secund, bent on one side like a sickle. Dicránum longifólium, s 14717
Falsely two-valved, having two valves which are not of the same nature as other valves Hákea, g 240 p 77
Farinaceous, full of flour Triticum, g 206 (note)
Fascicles, parcels or bundles Maránta obliqua, s 19
Fasciculate, (118) arranged in bundles or parcels Aspálathus, g 1528 (note)
Fastigiate, (119) tapering to a narrow point like a pyramid Salicórnia procúmbens, s 118
Fauces, (120) the jaws, the gaping part or orifice of a monopetalous flower, Acácia, g 2427 (note)
Favose, (11) pitted or excavated like the cells of a honeycomb Thrincia, g 1633 p 661
Feathery, resembling a feather Arundinaria, g 219 p 35
Febrifuge, efficacious in moderating fever Swiеténia febrífuga, s 9807
Feculent, muddy, thick with sediment Aloe, g 770 (note)
Fecundation, the act of making fruitful Jasíone, g 547 (note)
Ferraces, (121) thickly set with spines, p 443
Ferruginous, iron colored, rusty Sidéritis, g 1252 (note)
Fibrillose, (122) covered with little strings or fibres p 989
Fibrous, (123) being composed of fibres Scírpus multicaulis, s 858
Fiddle-topped, (124) having a lip resembling the figure of a fiddle Zingiber pandurátum, s 53
Filiform, shaped like a thread Mantísia, g 16 p 1
Fimbriate, (125) fringed Eleusíne, g 200 p 33
Finger-parted, (97) divided into lobes having a fanciful resemblance to the five fingers of a human hand Verónica vérna, s 254
Fistular, or *Fistulous*, hollow like a pipe Monárda media, s 356
Flaccid, feeble, weak Cánna fláccida, s 15
Flexile, capable of being bent in different directions, pliable Paullínia, g 923 (note)
Flexuose, having a bent or undulating direction Alpínia cardamomum, s 48
Flexuose recurved, bent backward in a flexuose or undulated manner Dicranum crispum, s 14723
Flocci, little tufts like wool p 983
Floræ horologicæ, flowers which expand at particular hours, whence they are a sort of timekeepers Anagállis, g 357 (note.)
Floral envelopes, the calyx, bracteæ, and corolla, which envelope the inner parts of the flower are all so called p 1.
Florets, (126) little flowers, chiefly applied to those which constitute what were formerly called compound flowers Festúca vivípara, s 1093
Floriferous, that which bears flowers Cólchicum, g 851 (note)
Flosculous, compound flowers, consisting of many tubulose monopetalous florets Cárduus, g 1663 p 680
Foliaceous, (127) having the form of leaves. Pincknéya, g 492 p 113
Follicle, (128) a particular kind of seed-vessel Hákea, g 240 p 177
Footstalks, (129) the stalks of either flowers or leaves Avena, g 171 (note)
Fornicate, (130) arched Rosélea, g 7 p 1
Fragmentary, composed of fragments Lecidéa microphýlla, s 15440
Fringed, (131) having a border like a fringe Cánna glàuca, s 16
Frond, the leaves of palms Sábal, g 855 p 292
Frontal, that which is in front Kæmpféria rotúnda, s 67
Frosted, (131) covered with glittering particles, as if fine dew had been congealed upon it Anomathéca, g 106 p 31
Fructification, all those parts composing the flower and fruit of plants Póa alpina p 67 (note)
Frutescent, or *Fruticose*, shrubby Piper, g 77 (note)
Fugacious, that which lasts but for a short time Utricularia, g 53 (note)
Fulvous, tawny yellow or fox-colored Swietenia fulvo cincta, s 4545
Fungous, having the substance of fungi or mushrooms Cachrys, g 677 p 177
Funicle, (132) the little stalk by which a seed is attached to the placenta Cardámine, g 1392 p 536
Furcate, forked Ajuga furcáta, s 8000
Furfuraceous, scaly, mealy, scurfy Agaricus graminósus, s 13745
Fuscous, blackish-brown Bruma ericoídes, s 3005
Fusiform, (133) spindle-shaped Selinum palustre, s 3669

G

Galeate, (134) helmeted, the upper lip of a ringent corolla is the galea of that corolla Touréttia, g 1299 p 492
Gelatine, jelly, a term of chemistry p 994
Gelatinous, consisting of jelly Chrysophýllum, g 424 (note)
Geminate, doubled Didýmodon, g 2230 (note)
Gemmæ, (135) leafy buds is distinguished from alabastra or flower buds Bryum, g 2240 (note)
Geoponic, relating to agriculture Columéllia, g 1785 (note)
Germ, or *Germen*, the old name of the ovarium Muscári, g 821 (note)
Germen inferior, (136) fruit below the flower p 1
Germination, the first act of vegetation in a seed Triticum spélta, p 70 (note)
Gibbous, protuberant Maránta gibba, s 23
Glabrous, smooth Aspéruia lævigáta, s 1641
Gladiate, (111) shaped like a short straight sword Eryngium iguaticum, s 3495
Glandular, having glands Schwénckia, g 42 p 9
Glaucescent, or *Glaucous*, having something of a bluish hoary appearance Mesembryánthemum glaucéscens, s 7275
Glaucous, having a decided hoary grey surface Cánna glauca, s 16
Globose, or *Globular*, (136) round or spherical Pinguícula lusitánica, s 322

Glochidate, having hairs, the ends of which are split and hooked back, so that the hook is double Thrincia hispida, s 11175
Glomerate, (137) gathered into a round heap or head. Conýza glomeráta, s 11850
Glottis, the throat Acácia, g 2127 (note)
Glumaceous, plants are said to be glumaceous when their flowers are like those of grasses Cládium, g 74 p 11
Glume, (138) a part of the floral envelopes of a grass Anthoxánthum, g 76 p 11
Gluten, a chemical principle Tríticum, g 206. (note)
Glutinous, adhesive Sálvia glutinósa, s 398
Granoid, (139) the segments of the flowers of Rumex have tubercles which are called grains Rúmex patiéntia, s 4997
Graniform, formed like grains of corn Mesembryánthemum parvifólium, s 7441
Granular, covered as if with grains Gálium ánglicum, s 1616
Gregarious, herding together Agáricus fúsipes, s 15857
Grooved, furrowed, channelled, marked with grooves Cauc'lis, g 626 p 115
Grumous, clubbed, knotted, contracted at intervals into knots Aconitum napéllus, g 1205 (note)
Gynandrous, (140) having the stamens and style combined in one body O'rchis, g 1859
Gyrose, turned round like a crook Urédo gyrósa, s 16640

H.



Habit, features or general appearance of a plant Dichptéris, g 48 p 9
Hæmorrhages, copious bleeding Acácia, g 2127 (note)
Hæmorrhoid, a kind of disease Ornithogalum, g 802 (note)
Hastate, (141) formed like the head of a halbert Sálvia canariénsis, s 372.
Hastato-lanceolate, between halbert shaped and lanceolate Dicránum várium, s 14728
Hastato-sagittate, between halbert-shaped and arrow-shaped A'rum maculátum, s 13472
Haulm, dead stems of herbs Dioscórea, g 2085. (note)
Helmet, (134) the same as *Galea*, see Galeate Monárda, g 60 p 10.
Herbaceous, a plant the stem of which perishes annually Maránta arundinácea, s 18
Hermaphrodite, consisting of two sexes. Hippúris, g 23 (note)
Hexagonal, six-sided I'ris ochroleúca, s 782
Hexandrous, (142) having six stamens Gardénia hexándra, s 2834
Hexangular, six-angled I'ris grammea, s 795
Hexapetalous, having six petals I'urcræ'a cubénsis, s 4105
Hilum, (143) the scar or mark on a seed which indicates the place by which it adhered to the placenta A chras, g 427 p 111
Hirsute, rough with soft hairs Pánicum miliáceum, s 918
Hispid, rough with stiff hairs Justícia cihária, s 288
Hoary, covered with white down O'lea oleáster, s 135
Homogeneous, having a uniform nature, or principle, or composition Draparnáldia ténuis, s 15105
Honey pore, (144) the pore in flowers which secretes honey Geissorhíza rochénsis, s 646
Honey-scales, (145) the scales in flowers which secrete honey Cotylédon, g 1060 p 341
Honey-spots, the spots in flowers which secrete honey Ruta, g 998 p 509
Hooded, (130) being curved or hollowed at the end into the form of a hood Hippocratéa, g 83 p 30
Horn, (146) any long subulate process in a flower is called a horn Zingiber, g 10 p 1
Husks, the dry envelopes of either flowers or fruits Sporóbolus, g 159 (note)
Hyaline, crystalline, transparent Diatóma, g 2260 p 924
Hybrid, mule, partaking of the nature of two species Syringa chinénsis ♂ rothomagénsis, s 161
Hydragogue, that which removes dropsy Euphórbia, g 1103 (note)
Hygrometrical, indicating the approach of moisture Avéna stérilis, p 60 (note)
Hypercathartic, a medicine that produces too powerful effects as a purgative. Verátrum, g. 2128 (note)
Hypocrateriform, salver-shaped. Galipéa, g 41 p 9
Hypogynous, (147) situated below the ovarium Serrúria, g 234 p 77
Hypophyllous, (148) under the leaf Erineum griseum, s 16592

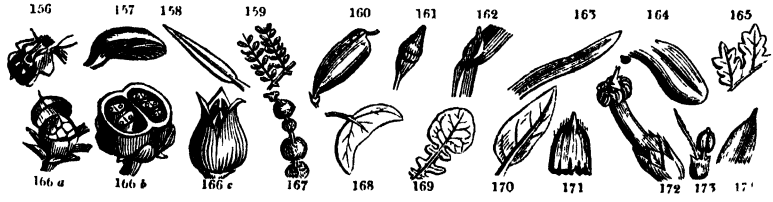
I

Iced, (131) covered with particles like icicles. Mesembryánthemum pisifórme, s 7210
Ice drops, transparent processes resembling icicles Mesembryánthemum glaciále, s 7377
Imbricate, (149) laid one over another like tiles. Maránta oblíqua, s 19
Incised, (150) cut, separated by incisions Verónica austríaca, s 239
Incrassated, (151) becoming thicker by degrees Tétraphis Browniána, s 14682
Incurved, bending inward Roscóea, g 7 p 1
Incurve-recurved, bending inwards and then backwards Mesembryánthemum lineolatum, s 7302
Indehiscent, not dehiscing Néslia, g 1426 p 537
Indigenous, native of a country Crócus, g 93 (note)
Indurated, hardened Míhum, g 141 p 32
Indusium, (152) the membrane that encloses the thecæ of ferns Polybótrya, g 2168 p 876
Inflated, blown up Amómum sylvéstre, s 78
Inflexed, bending inward Dicliptera, g 48 p 9
Inflorescence, disposition of flowers Chloránthos, g 25 (note)
Infundibuliform, funnel-shaped Tritónia fenestráta, s 672
Innocuous, harmless Gomphocárpus, g 587 p 115
Inspissated, thickened, spoken of sap or other liquor A'tropa, g 446 (note)
Intenerating, having the power of making tender or softening Cárica, g 2095 (note)
Internodes, the space between the joints of plants Bambusa, g 752 (note)
Interpetiolar, between the petioles or leafstalks Microloma, g 578 (note)
Interstices, spaces between one thing and another Pimpinélla, g 635 p 116
Intramarginal, within the margin Listéra, g 1876 p 749
Inverse, inverted Sántalum, g 307 p 79
Involucels, (153) the partial involucra of umbelliferous plants Caúcalis platycárpos, s 3528
Involucral, having an involucre Ammóbium, g 1681 (note)
Involucrated, covered with an involucre Penicillária, g 148 p 32
Involucre, or *Involucrum*, (154) the bracteæ which surround the flowers of Umbelliferæ in a whorl. Caucalis platycárpos, s 3528
Involute, rolled inwards Moræ a, g 116 p. 31.

J

Joints, the places at which the pieces of the stem are articulated with each other Boerhaávia erécta, s 105
Julîform, (155) formed like an amentum or catkin Brýum iuláceum, s 14816

K.



Kalyform, formed like Sálsola káli, a sea-coast plant Chóndria kalifórmis, s 15291
Keel, (51) when the midrib of a leaf or petal is sharp and elevated externally it is called a keel p 31
Kneed, or *Knee-jointed*, bent like the knee-joint. Aconitum tortuósum, s 7867

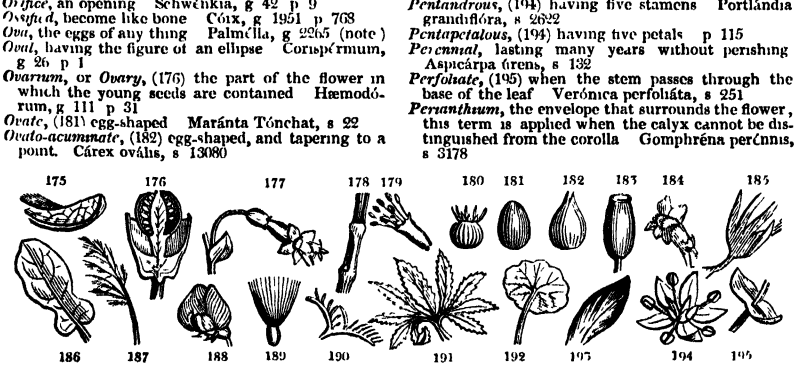
L.

Labellum, (156) the front segment of an orchideous or other flower Ionópsis, g 1919 p 750
Lacinæ, segments of any thing Parmelia cycloséhs, s. 15581
Laciniate, cut or divided into segments Phlómis lacinióta, s 8565
Lactescent, yielding milky juice. Maclúra aurantíaca, s. 13256.
Lacunæ, little pits or depressions p 948
Lacunose, covered with little pits or depressions Helvélla crispa, s 16200
Lævigated, smoothed Œnothéra glauca, s. 5459
Lamellated, (157) divided by plates internally Músa, g 721 (note)
Lamina, literally a plate, it is mostly applied to the leaf of a plant considered without its petiole. Béta cicla. p 207 (note)
Lanceolate, (158) lance or spear shaped Cóstus, g 11 p 1
Lanceolato-subulate, between lanceolate and subulate Sphágnum cuspidátum, s 14653
Lateral, on one side Alpínia nútans, s 43
Lax, loose, not compact Zingiber roseum, s 59
Leaflets, (159) small parts of compound leaves Codárium acutifólium, s 133
Legume, or *Legumen*, (160) a pod, the fruit of leguminous plants Gompholóbium, g 954 (note)
Leguminous, plants which bear legumes, such as the pea, the bean, the kidneybean p 8
Lenticular, shaped like a lens. Kyllínga, g 129 p. 31
Lentiform, in form like a lens Rivína, g 253 p 78
Leprous, covered with spots or scales Rhododéndron ferrugíneum, s 5923
Lid, (161) the calyx which falls off from the flower in a single piece Eucalyptus, g 1126 p. 409
Ligula, (162) the membrane at the top of the petiole of grasses and other plants. Zingiber pandurátum, s 53
Ligulate, (163) strap-shaped. Anelléma sínicum, s 595.
Limbate, having a colored or dilated surface Erica oppositifólia, s 5265
Linear, when the two sides are parallel. Cánna, g 1 p 1
Linear-ensate, long sword-shaped Márica califórnica, s 833
Linguiform, or *Lingulate*, (164) tongue-shaped Hæmánthus coccíneus, s 4149
Lipped, (156) having a distinct lip or labellum Roscóea, g 7 p 1
Lithontriptic, having the power of breaking the stone in the bladder p 1075.
Lobelets, (165) small lobes. Geránium sanguíneum, s 9644
Lochial, relating to the natural discharges consequent upon childbirth Aristolóchia, g 1934 (note)
Locomotion, motion from place to place. Mimósa, g 2124 (note)
Loculaments, partitions or cells of a seed vessel. Cystoséira, g 2329 p 927
Locular, (166) a fruit is called unilocular if it contains but one cell (*a*), bilocular if two cells (*b*), trilocular if three (*c*), and so on Fícus, g 72 p 11
Loment, (167) a kind of legume falling in pieces when ripe Mulléra, g 1567 p 597
Lomentaceous, bearing pericarpia, called lomenta. Erucária, g 1445 p 539
Lorate, (163) shaped like a thong or strap Pancratium littorále, s 4062
Lubricate, to make slippery. Acácia, g 2127 (note)
Lucid, bright, shining Sálvia lineatifólia, s 399
Lunate, or *Lunulate*, (168) shaped like a half moon. Cestrum auriculátum, s 2465.
Lurid, a color between purple, yellow, and grey. Moræ'a lurida, s 828
Lymphatic, of or belonging to lymph or sap p 874.
Lyrate, (169) lyre-shaped. Sálvia lyràta, s 450.

M.

Macerate, to decompose by steeping in water or other liquid Méntha, g 1254 (note)
Margined, relating to the margin Hellénia, g 9 p 1
Masticatory, grinding or chewing with the teeth Pimpinélla, g 635 (note)
Math, an old term for crop Alopecúrus, g 164 (note)
Matrix, a place where any thing is generated or formed Calothrix, g 2286 p 925
Medulla, the pith of a plant p 1053
Medullary, relating to the pith of plants Mimósa, g 2124 (note)
Melastomaceous, partaking of the nature or appearance of Melástoma p 300
Melliferous, honey-bearing Anchúsa, g 332 (note)
Membranaceous, or *Membranous*, having the texture of a membrane Chionánthus maritima, s 153
Menstruum, a liquor used as a dissolvent Ranúnculus, g 1233 (note)
Meshes, the openings in any tissue Mougeótia, g 2290 p 925
Micaceous, glittering, shining. Watsónia, g 101 (note)
Midrib, (170) the large vein which passes from the petiole to the apex of a leaf Póthos, g 252 (note)
Miliary, granulate resembling many seeds Citrus médica, p 655 (note)
Mitriform, (171) formed like a mitre p 895.
Mobility, the power of motion Mimósa, g 2124 (note)
Monadelphous, (172) having the filaments cohering in a tube. Lýxia monadélpha, s 629
Monandrous, (173) having one stamen Alchemilla Aphanes, s 1519
Moniliform, formed like a necklace, that is to say, with alternate swellings resembling beads and contractions Helióphila amplexicaúlis, s 9312
Monocotyledons, having one seed leaf p 236
Monœcious, having the one sex in one flower, and the other in another Schœ'nus monoícus, s 847
Monopetalous, having one petal p 9
Monosepalous, having one sepal or division of the calyx Pontedéria, g 730 p 237
Mordant, that which enables vegetable matter or tissue to receive dyes or coloring matter, and to retain them p 1064
Mottled, marked with blotches of color of unequal intensity passing insensibly into each other Syringa pérsica, s 162
Mucilage, a turbid slimy fluid Sálvia, g. 62 (note)
Mucronate, (174) pointed sharp Corispérmum intermédium, s 127
Mucronulate, having a little hard point Bánksia integrifolia, s. 1459
Mulch, a gardener's term for the placing manure about the roots of trees on the surface of the ground Rósa, g. 1148 (note)
Multifarious, very numerous, or arranged in many rows Aloe rígida, s 4387
Multipartite, much divided Pterónia stricta s 11492
Multiplex, much multiplied Selágo fasciculáta, s 8657
Muricated, covered with short sharp points Pánicum muricatum, s 949
Muricato-hispid, covered with short sharp points and rigid hairs or bristles Bryónia scabrélla, s. 13588

N.



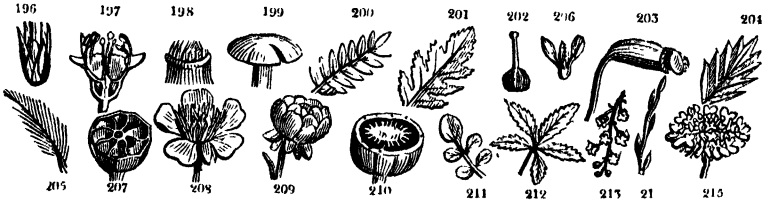
Naiades, nymphs of the springs and fountains, a particular order of Monocotyledonous plants. p 772
Narcotic, producing sleep or torpor Brómus, g. 184 (note)
Navicular, (175) boat-shaped. Airópsis, g 160 p 32
Neck, the upper tapering end of bulbs is called the neck Crínum sumatránum, s 4184
Nectariferous, bearing honey Swértia, g 599 p 115
Nectary, or *Nectarium*, (144, 145) that part of a flower which produces honey Alpínia Allúghas, s 51
Nerves, the strong veins upon leaves or flowers. Cánna rubricaulis, s 11
Nervimotion, the power of motion in leaves Mimósa, g 2124 (note)
Nervose, or *Nervine*, composed of nerves Eránthemum pulchéllum, s 312
Neuter, neither male or female Anthoxánthum, g 76 p 11
Nidulant, nestling; lying among any thing as a bird in its nest Samýda, g 1034 p 340
Nidus, the nest of any thing. Alcyonídium, g 2267 (note)
Nodding, (177) having a drooping position Verónica complicáta, s. 190.
Nodi, (178) the articulations of plants the place where one joint is articulated with another Sporóchnus villósus, s 15333
Nodose, having many nodi or knots Póa serótina, s 1187
Nodules, small hard knots Ischæ'mum aristátum, s 14230.
Notch-flowered, having the flower notched at the margin Verónica crenuláta, s 185
Nucamentaceous, producing nuts Búnias, g 1444 p 539
Nucleus, the kernel Myrica Fáya, s 13869

O

Ob is used in the composition of Latin technical terms, to indicate that a thing is inverted, for instance, obovate is inversely ovate, obcordate inversely cordate, and so on
Occidental, coming from the west Alpínia occidentális, s 42
Ochraceous, having the color of clay or yellow ochre Oscillatória ochrácea, s 15118
Octandrous, (179) having eight stamens Rivina octándra, s 1511
Octogynous, (180) having eight styles Phytolácca octándra, s 6572
Officinal, any thing that is, or has been, used in the shops Kæmpferia Galánga, s 68
Oleaginous, having the qualities of oil Rivina, g 253 (note)
Oleraceous, esculent, eatable Ranúnculus, g 1233 (note)
Olivaceous, having the qualities of olives p 924
Opercular, (161) covered with a lid p. 749
Operculiform, having the figure and position of a round lid of something Operculária, g 250 p 78
Operculum, (161) a lid p 874
Opiate, having the power of opium Dictámnus, g 997 (note)
Orbicular, or *Orbiculate*, a plane surface circumscribed by a circle Farsétia, g 1307 p 586
Orchideous, of or belonging to the natural order of Orchideæ p 748
Orifice, an opening Schwénkia, g 42 p 9
Ossified, become like bone Cóix, g 1951 p 768
Ova, the eggs of any thing Palmélla, g 2265 (note)
Oval, having the figure of an ellipse Corispérmum, g 26 p 1
Ovarium, or *Ovary*, (176) the part of the flower in which the young seeds are contained Hæmodórum, g 111 p 31
Ovate, (181) egg-shaped Maránta Tónchat, s 22
Ovato-acuminate, (182) egg-shaped, and tapering to a point. Cárex ovális, s 13080
Ovato-cylindraceous, (183) egg-shaped, with a convolute cylindrical figure Didýmodon purpúreum, s 14762
Ovato-deltoid, triangularly egg-shaped Bétula álba, s 13188
Ovato-rotundate, roundly egg-shaped Phásceum múticum, s. 14660.
Overlapping, when the margin of one thing lies upon that of another, it is said to overlap. Cyclámen vérnum, s 2051
Ovoid, (181) egg-like Psorálea Lupinéllus, s 10758.
Ovules, (176) the young seeds of plants contained in the ovarium Nemóphila, g 386 p 110

P

Palate, (184) the mouth of a ringent flower Pinguícula edéntula, s 327
Palcaceous, abounding with chaffy scales Brométia Karátas, s 4114 (note)
Palmated, or *Palmatifid*, (185) divided so as to resemble a hand Curcúma Zedoária, s 80
Pandurtform, (186) having the figure of a fiddle Kæmpféria pandurata, s 70
Paniculed, (187) loose-spiked. Maránta, g 2 p 1
Pannary, useful for making bread Tríticum, g 206 (note)
Papilionaceous, (188) butterfly-shaped flowers p 338
Papillose, producing small glandular excrescences like nipples Onosmódium hispidum, s 1930
Pappus, (189) the crown of the fruit of Compósitæ, and similar plants Centránthus, g 20 p 1
Papulose, producing small glands like pimples Mesembryánthemum parvifólium, s 7442.
Parabolically, in form like a parabola Aloe brevifólia, s 4435
Parenchyma, all the parts of plants which consist of cellular tissue only Solorina, g 2331 p 948
Parietal, being attached to the sides of an ovarium instead of its axis Glóbba, g 15 p 1
Patent, spread out or expanded Lycopódium annótinum, s 14656
Patent-reflexed, spread out and turned back Carex paucifióra, s 13069
Patulous, slightly spreading Centaurea babylónica, s 12613
Pectinate, (190) resembling the teeth of a comb Verónica orientális, s 237
Pectoral, relating to the breast Trápa, g 308 (note)
Pedatifid, (191) cut into lobes, the lateral ones of which do not radiate from the petiole like the rest Saxifraga pedatifida, s 6089
Pedicellate, slightly stalked. Cestrum tinctórium, s 2475
Pedicels, small footstalks of flowers Commelina coelestis, s 592
Peduncle, the common footstalk of flowers Cánna Lambérti, s 5
Pellicle, a thin skin Papyrus, g 128 (note)
Pellucid, bright, transparent Mesembryánthemum réptans, s 7278
Peltate, (192) when the petiole is fixed in the disk instead of the margin Piper peltatum, s 514
Pencilled, (193) marked in lines as if with a pencil Crócus lagenaeflórus γ penicillátus, s 612
Pendulous, drooping, hanging down Curcúma angustifólia, s 91
Pentagonal, having five angles Piquéria, g 1704 p 663
Pentagynous, (194) having five styles Phytolácca abyssínica, s 6573
Pentandrous, (194) having five stamens Portlándia grandiflóra, s 2622
Pentapetalous, (194) having five petals p 115
Perennial, lasting many years without perishing Aspicárpa árens, s 132
Perfoliate, (195) when the stem passes through the base of the leaf Verónica perfoliáta, s 251
Perianthium, the envelope that surrounds the flower, this term is applied when the calyx cannot be distinguished from the corolla Gomphréna perénnis, s 3178



Pericarp, the seed vessel Decringia, g 503 (note)
Perichætial, (196) leaves which in mosses surround the base of the stalk of the theca p 895
Perigynous, (197) inserted into the calyx Larbræ'a, g 1069 p 341
Peristome, (198) the rim which surrounds the orifice of the theca of a moss p 895
Perithecium, ***Peridium***, or ***Perisporium***, different kinds of envelopes of the reproductive organs of fungi Pyrenula, g 2337 p 948
Persistent, remaining, not falling off Codárium, g 30 p 8
Pervious, having a passage through which anything can be transmitted Primula, g 350 p 110
Petaloid, like petal Damasónium, g 850 p 241
Petals, (194) divisions of the corolla p 1
Petiolate, having footstalks Alpinia malaccénsis, s 46
Petiole, footstalks of leaves Cissus heterophýlla, s 1780
Petiolules, little petioles Erythrina, g 1521 (note
Pezizoid, like a Peziza, a kind of fungus resembling a cup in figure p 1021
Phanogamous, such plants as are visibly furnished with sexual organs p 108
Phagedena, eating, corroding, a gnawing of the stomach, also applied to ulcerous sores Anthemis, g 1778 (note)
Pharmaceutical, relating to the art of pharmacy Astrágalus Tragacánthæ, p 667 (note)
Phthisis pulmonalis, consumption of the lungs Arum, g 2127 (note)
Pileate, (199) having a cap or lid like the cap of a mushroom Cassúvia clándica, s 1811
Pileus, the cap of a mushroom p 978
Piliferous, bearing hairs Sphenogyne dentata, s 12128
Piliform, formed like down or hairs Grimmia pulvinata, s 14690
Pilose, slightly hairy Momórdica Kalmiana, s 365
Pimpled, covered with minute pustules resembling pimples Saxifraga higuláta, s 6051
Pinnæ, or ***Pinnulæ***, the segments of a pinnated leaf Calceolaria pinnata, s 515
Pinnate, (200) a leaf is so called when it is divided into numerous smaller leaves or leaflets Codárium acutifólium, s 133
Pinnatifid, (201) a leaf is so called when it is divided into lobes from the margin nearly to the midrib Centranthus calcitrapæ, s 112
Piquancy, sharpness, pungency Spilánthes, g 1695 (note)
Pistacia, formed like peas Lagétta, g 909 p 300
Pistillum, or ***Pistil***, (202) the columnar body situate in the centre of a flower, consisting commonly of three parts, viz the ovarium, style, and stigma Knáppia, g 142 p 32
Pitchers, (203) hollow leaves so called Nepénthes distillatoria, s 14077
Pith medulla occupying the centre of a stem or shoot Melia, g 193 (note)
Pituitous, discharging mucus Pánax, g 2166 (note)
Plane, flat Matricaria, s 1771 p 664
Plano-compressed, compressed down to a flattish surface Pomcdána, g 977 p 339
Plethoric, having a full habit Juniperus, g 2113 (note)
Plicate, (204) plaited. Nicotiána repánda, s 2206
Plumose, (205) feathery, resembling feathers Centránthus, g 20 p 1
Plumula, (206) the young leaves in the embryo p 1053
Plurilocular, (207) having many cells p 1085
Pod, (160) a kind of seed vessel such as that of the pea tribe Epimedium, g 297 p 79
Polyandrous, (208) having more stamens than 20 Royéna ambígua, s 6037
Polygamous, a plant is said to be polygamous when some flowers are male, others female, and others hermaphrodite Rhagódia, g 562 p 114
Polygynous, (208) having numerous styles Royéna ambígua, s 6037
Polypetalous, (209) having many separate petals p 10
Polyspermous, (210) having many seeds p 1066
Pome, an apple Pyrus, g 1138
Pores, apertures in the cuticle through which transpiration takes place Lasiopétalum, g 523, p 113
Porrect, extended forward. Bauhinia aurita, s 5768
Pouch, a little sack or bag at the base of some petals and sepals Nigritélla, g 1860
Præmomen, the first name of several; in plants it is the same as the generic name Crócus, g. 93, note)
Precocity, ripe before the usual time Dáphne Mezéreum, p. 323 (note)
Prismatic, formed as a prism Polycnémum arvénse, s 599
Processes, protrusions either natural or monstrous. Orthotrichum, g 2283 p 896
Proliferous, a plant is said to be proliferous when it forms young plants in abundance about its roots. Scirpus Luzulæ, s 867
Prominences, protuberant risings from the surface Colutéa arboréscens, s 10484
Propendent, hanging forward and downward Cæ'sia vittáta, s 4831
Prurient, stinging p 1061
Pubescence, down, closely pressed to the surface. Eriganéa véca, s 7506
Pullulating, budding Conférva pátens β prolifera, s 1077
Pulverised, reduced to powder Crócus, g 93 (note)
Pulvinate, become cushion-shaped Grimmia pulvinata, s 14690
Pulvinuli, little cushions p 948
Punctiform, formed like points Peziza punctáta, s 16267
Pungent, stinging or pricking Corispérmum Redowskii, s 126
Pustular, or ***Pustulate***, covered with glandular excrescences like pustules Pelargonium pustulosum, s 9021
Pustules, pimples or little blisters Brunsvigia Rádula, s 4215
Pyriform, shaped like the fruit of a pear Paullínia pinnata, s 5612

Q

Quadrangular, four-angled Dorstónia Houstóni, s 1526
Quadrifarious, arranged in four rows or ranks Struthíola imbricáta, s 1487
Quadrifid, divided four times Plantágo, g 278 p 78.
Quadriglandular, having four glands. Malpighia glandulífera, s 6372
Quartz, a species of stone Laurus cinnamómum, s 5640
Quaternary, succeeding by fours p 76
Quaternate-pinnate, (211) pinnate, the pinnæ being arranged in fours Anthyllis tetraphýlla, s 10211
Quinate, in fives Póthos pentaphylla, s 1506
Quinquefid, (212) divided into five Cissus, g 305 (note)
Quintuple, five times multiplied Ephédra, g 2115 p 819

R

Racemes, (213) a particular arrangement of flowers, when they are arranged around a filiform simple axis, each particular flower being stalked Alpinia nutans, s 43
Racemose, flowering in racemes Verónica Barrelléri, s 212
Rachis, (214) that part of a culm which runs up through the ear of corn, and consequently the part that bears the flowers in other plants Páspalum, g 139 p 31.
Radiant, or ***Radiate***, (215) a flower is said to be radiant, when, in a cluster or head of florets, those of the circumference or ray are long and spreading, and unlike those of the disk Scabiósa canéscens, s 1569

Radical, proceeding from the root. Phrýnium capitátum, s 27

Radicant, producing roots from the stem. Marcgraávia, g 1163 (note)

Radicule, (216) that end of the embryo which is opposite to the cotyledons p 537

Radius, (217) the ray of compound flowers. Solidágo canadénsis, s 12066

Ramenta, little brown withered scales with which the stems of some plants, especially ferns, are covered Rhodoméla lycopodioides, s 15280

Ramentaceous, (218) covered with ramenta. Euphórbia tragífera, s 6793.

Ramifications, subdivision of roots or branches Eragróstis pilósa, s 1207

Ramose, branchy Ilex, g 315 (note)

Rami, twigs or small branches Draparnáldia, g 2284 p 925

Raphe, in seeds this is the channel of vessels which connects the chalaza with the hilum, in umbelliferous plants it is the line of junction of the two halves of which their fruit is composed Búbon, g 640 p 116

Rationale, the reason of a thing Solánum, g 451 (note)

Receptacle, (219) that part of the fructification which supports the other parts Pollichia, g 21 p 1

Recesses, the bays or sinuses of lobed leaves Sisýmbrium obtusángulum, s 9169

Rectangular, right-angled. Teúcrium asiáticum, s 8114.

Rectilinear, right-lined. Bómbax eriánthos, s 9942

Rectum, an intestine A'nthemis, g 1778 (note)

Recurved, bent backward Zíngiber, g 10 p 1

Recurvo-patent, bent back and spreading Grímmia apocárpa, s 14687

Reflexed, bent backward. Cánna gigantéa, s 6

Reflexed recesses, sinuses of leaves which are bent backward from the ordinary direction of the surface of a leaf p 165

Refrigerant, producing coolness Oxalis, g 1065 (note)

Reniform, (220) kidney-shaped Leptánthus reniformis, s 736

Repand, (221) a leaf having a margin undulated and unequally dilated is said to be repand Eránthemum bícolor, s 313

Repando-dentate, repand and toothed Doróni:um Pardaliánches, s 12189

Repellant, that which turns you away from any thing A'tropa, g 446 (note)

Replicate, folded back Cyclópia, g 946 (note)

Resolutive, or *Resolvative*, having the power to dissolve Argemóne, g 1172 (note)

Resolvent, having the power of dissolving Curcúma, g 14 (note)

Restringent, astringent Bérberis, g 829. (note)

Resupinate, inverted in position, so that that which was in front becomes at back Hedýchium, g 6 p 1

Reticulated, resembling a net. Hákea undulàta, s 1435

Retuse, (222) abruptly blunt Hedýchium flávum, s 36.

Revolute, rolled back Cánna speciósa, s 13

Rhomboidal, (225) like a rhombus Salvia mexicána, s 385

Rhomboid-ovate, rhomboidally egg-shaped Chenopódium atriplícis, s 3416

Rib, (170) the projecting vein of any thing Curcúma rubéscens, s 83

Rigid, stiff Notelæ a rigida, s 157

Ringent, (223) gaping Justicia, g 47 p 9

Ringing, making an incision resembling a ring all round a branch Liriodéndron, g 1216 (note)

Rotate, (224) a monopetalous corolla, the limb of which is flat and the tube very short, is called rotate Valerianélla discoídea, s 563

Rotundo-ovate, roundly egg-shaped Cárex fúlva, s 13123

Rubefacient, any thing which reddens the skin, or raises slight cutaneous inflammation Euphórbia, g 1103 (note)

Rudiment, when an organ is imperfectly developed, botanists call such developement a rudiment Molínia, g 194 p 33

Rufous, reddish orange-colored, or rusty Cánna glauca β rufa, s 16

Rugose, rough or coarsely wrinkled. Calceolária rugosa, s 317

Rugulose, finely wrinkled Sálvia chamædryoídes, s. 386

Runcinate, (226) hooked back, applied to the lobes of leaves Hésperis runcinata, s 9161

Runcinato-dentate, hooked back and toothed. Apárgia taráxaci, s 11166

Runners, (229) procumbent shoots which root at their extremity Ranunculus salsuginósus, s 8037

Rusty, rust-colored Curcuma ferruginea, s 87

S

Saccate, bagged, having a bag or pouch, as many petals Calótropis, g 584 p 115

Sagittate, (227) shaped like an arrow-head Dorsténia arifólia, s 1528

Salivation, a discharge of saliva from the glands of the mouth Plumbágo, g 324 (note)

Samara, (228) a kind of winged seed vessel, the same as what the English call key O'rnus, g 69 p 11

Sapid, agreeable to the palate Nelúmbium, g 1213 (note)

Saponaceous, soapy Æsculus, g 866 p 296

Sarmentose, (229) producing sarmenta or runners Echites biflora, s 2355

Sawed, resembling the teeth of a saw Coldénia procúmbens, s 1833

Scabrous, rough with little asperities Sálvia runcináta, s 459

Scales, any small processes resembling minute leaves, also the leaves of the involucrum of Compósitæ Pollichia, g 21 p 1

Scandent, climbing Piper, g 77 (note)

Scape, (231) a stem rising from the root and bearing nothing but flowers Maránta comósa, s 24

Scarious, or *Scarious*, membranous and dry Butónia tenuifólia, s 1813

Schistous, rocky, formed of the rock called schist O'lea, g 32. (note)

Scion, a shoot intended for a graft Camélha, g 1476. (note)

Scoriæ, cinders Camélha, g 1476 (note)

Scrobiculate, excavated into little pits or hollows Antennária, g 1725 p 663

Scrotiform, formed like a double bag Ellísia, g 432 p 111

Scurfy, covered with scales resembling scurf Egístoma, g 365 p 110

Scutate, formed like an ancient round buckler Ptiléta, g 2311 p 925.

Secund, (232) arranged on one side only · the same as unilateral, which is better p 917

Sedges, a tribe of marsh plants so called p 31.

Segments, parts of any thing p 1

Semi-, half

Seminal, belonging to the seed Scabiósa, g 201 (note)

Semination, seeding Crócus, g 93 (note)

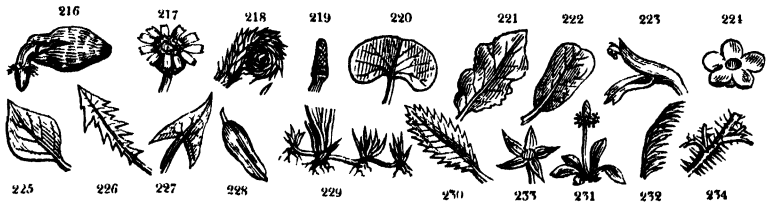
Sepals, (233) the segments of the calyx Sebæ'a, g 281 p 98

Septa, (166) the partitions that divide the interior of the fruit Rulingia, g 704 p 118

Septiferous, bearing septa Ramónda, g 374 p 110

Serrated, (230) like the teeth of a saw Maytenus boária, s 134

Serrulations, notchings like those of a saw Agave yuccæfólia, s 4093



Sessile, without footstalks Zostéra, g 24 p 1

Setacco-rostrate, having a beak with the figure of a bristle Cárex ampullácea, s. 13162

Setaceous, resembling a bristle in shape Justícia nígricans, s 282

Setæ, bristles Schœ'nus nigricans, s 845

Setiform, (234) formed like a bristle. Rosa hibérnica, s. 7501.

Setigerous, or ***Setose***, covered with bristles Knáppia, g 142 p 32

Sheath, the lower part of the leaf that surrounds the stem Zostéra, g 24 p 1

Sherds, the fragments of potting employed by gardeners to drain their flower-pots Protea, g. 201 (note.)

Shield, (29) a broad table-like process in the flower of Stapélia and its allies. Huérnia clavigera, s. 3351

Sialagogue, having the power of exciting saliva p 536.

Silicated, coated or mixed with flint Astrágalus tragacántha, p 637 (note)

Siliceous, flinty Laurus cinnamómum, g 934 (note)

Silicle, (235) the small round pod of Cruciferæ. Lunária, g 1395 p 536

Silique, (236) the long taper pod of Cruciferæ Brássica, g 1432.

Simple, the reverse of compound p 1

Sinuate, or ***Sinuose***, (237) bending in and out. Lycopus europæ'us, s 358

Sinuato-dentate, sinuate and toothed. Leóntodon palústris, s 11156

Sinus, the bays or recesses formed by the lobes of leaves or other bodies Hamamélis virginica, s 1814

Soboliferous, (238) producing young plants from the root Aloe brévis, s 4415

Sodden, soaked Prótea, g 231 (note)

Somniferous, causing sleep Primula véris, s 2029

Soporific, causing sleep Humulus, g 2074 (note)

Soredi'ferous, (239) bearing soredia Ramalina, g 2355 p 949

Sori, (240) the patches of fructification on the back of the fronds of ferns p 625

Spadix, (240) a spike protracted from a spatha Zostera, g 24 p 1

Spatha, a broad sheathing leaf enclosing flowers arranged upon a spadix Hedýchium spicatum, s 34

Spathaceous, furnished with a spatha p 1

Spathulate, (241) shaped like a spatula, a knife so called Canna glaucéa, s 6

Sphacelate, withered or dead Senécio ægýptius, s 11911

Spherical, round like a sphere Alpínia nútans, s 43

Spheroidal, almost like a sphere Cactus latispínus, s 6852

Spherules, (242) minute spheres Stromatosphæ'ria concéntrica, s 16360

Spike, (244) flowers sessile upon a long rachis Maránta látea, s 20

Spines, indurated branches or processes formed of woody fibre, and not falling off from the part that bears them Ancistrum, g 68 p 10

Spiniform, formed like a spine Mesembryánthemum spiniforme, s 7363

Spinous, full of spines Alpínia córnua, s 44

Spinulescent, having a tendency to produce small spines Mesembryánthemum spinulíferum, s 7421

Spinulose, covered with small spines Rhéum Ribes, s 5667

Spiral, (253) circularly involved Cóstus spirális, s 65

Sporules, that part in Cryptogamous plants which answers to the seeds of other plants p 874

Sporuliferous, bearing sporules Phállus impudícus, s 16336

Spurious, counterfeit Iris spúria, s 781

Spurs, (243) long processes resembling horns produced by various parts of the flower Cureúma, g 14 p 1

Squamiform, like scales Sántalum, g 907 p 79

Squarrose, (244) spreading rigidly at right angles, or in a greater degree Zingiber squarrósum, s 60

Squinancy, an inflammation in the throat Aspérula, g 268 (note)

Stamen, (245) the male organ of a flower p 1

Staminiferous, producing stamina Campánula, g 465 p 112

Standard, (188) the upper segment of the flower of Leguminósæ Thermópsis, g 944 p 338

Stellate, in the manner of a star Schwénkia, g 42 p 9

Stellulate, resembling little stars. Onósma taúricum, s 1907

Sterile, barren. Amómum grandiflórum, s 74.

Sternutatory, qualities which provoke sneezing Primula vulgáris, g 850 (note)

Stigma, (246) the female organ of a flower. Cánna, g 1. p 1

Stimulating, exciting Cínna, g 161. (note)

Stimuli, stinging hairs Urtica árdens, s. 13230.

Stipes, (247) the stalk of Fungi p 978

Stipitate, having a short stalk. Aspidístra, g 759 p 238

Stipulaceous, having appendages called stipulæ Solánum peruviánum, s 2516

Stipulary, occupying the place of stipulæ. Palúrus austrális, s 2896

Stipules, (248) small scales at the base of the petiole of certain leaves Spermacóce stylósa, s 1653

Stoloniferous, (249) having creeping roots Sesléria elongáta, s 1075

Stolons, root shoots Agróstis, g 156 (note)

Stomachic, relating or agreeable to the stomach Kæmpféria, g 12 (note)

Strangury, a disease, and produced on plants by tight ligatures Ornithogalum, g 802 (note)

Strata, layers, beds Capsicum, g 453 (note)

Striæ, small streaks, channels, or furrows p 877.

Striated, having striæ Alpínia racemosa, s 41

Strigæ, little, rigid, unequal, irregular hairs Chára hispída, s 15109

Strigose, having strigæ. Lithospérmum arvénse, s 1895

Strophiolate, surrounded by protuberances. Hovea, g 156 p 599

Struma, a wen or protuberance p 903

Strumose, or ***Strumous***, covered with strumæ Mesembryánthemum grússum, s 7422

Style, (250) the stalk which intervenes between the ovarium and stigma, bearing the latter p 1

Styptic, having the power to staunch blood Rhús, g 681 (note)

Sub, in composition, signifies subordinate, or somewhat

Succedaneum, coming in the place of another Tacca, g. 758 (note)

Succulent fleshy and filled with juice Blítum, g 28 (note)

Sudorific, having the power of producing perspiration Sálvia, g 62 (note)

Suffruticose, shrubby in a slight degree Spermacóce suffruticósa, s 1656

Sulcate, furrowed Vibórgia, g 1523 p 599

Supernatant, floating on the surface of any thing Aloe, g 770 (note)

Suppurate, to generate matter Rhus, g 681 (note)

Supra-decompound, doubly compounded Scirpus sylváticus, s 868

Suculi, young shoots Erythrónium, g 782 (note.)

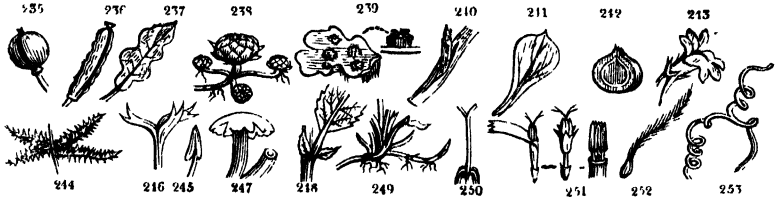
Suture, the line formed by the cohesion of two parts Mirbélia, g 967 p 338

Syngenesious, (251) belonging to the nineteenth class of the sexual system Phlóx, g 369 (note)

Synthetical, combining, opposed to analytical Gilénia, g 1142 (note)

Syphilitic, useful in the cure of syphilis Chenopódium, g 611 (note)

T



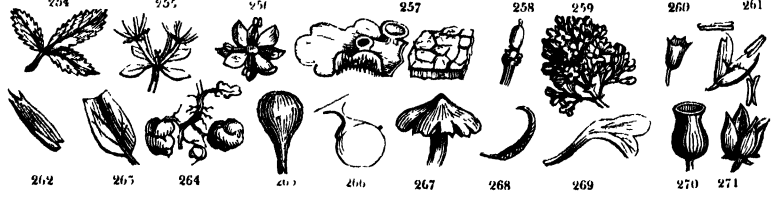
Tails, (252) the long feathery or hairy terminations of certain fruits Clématis chinénsis, s 7968

Tap-root, a root which penetrates deep and perpendicularly into the ground without dividing Crinum defixum, s 4182

Tartareous, consisting of tartar Lecidéa cónfluens, s 15384

Teated, resembling the figure of the teat of animals. Achras, g 427 p 111

Tendrils, (253) the curling twining organs by which some plants lay hold of others Vitis índica, s 2858



Tenesmus, a disposition to go to stool, without the power of evacuation A'nthemis, g 1718 (note)
Tepid, lukewarm A'nthemis, g 1778 (note)
Terebinthinate, consisting of turpentine A'bies balsámea, p 805 (note)
Terete, taper, round and long Hákea oblíqua, s 1423
Terminal, ending, or at the top Maránta lutea, s 20
Ternary, consisting of threes Valeriána, g 78 (note)
Ternate, (254) growing together in threes Hedýchium elatum, s 31
Tessellated, variegated by squares. Sarcocéphalus, g 498 p 113
Testa, the skin or integument of the seed Psídium, g 1118. p 409
Testaceous, having a pale brown color Mesembryánthemum testáceum, s 7430
Tetrachotomous, (255) a stem that ramifies in fours Euphórbia, g 1103 (note)
Tetrandrous, (256) having four stamens Collinsónia anisáta, s 469
Tetrapetalous, (256) having four petals p 1069
Tetraspalous, (256) having four sepals p 1069
Thalamus, (258) that part of a flower which rises from below the ovarium and sometimes supports the outer envelopes p 539
Thallus, (257) that part which bears the fructification of Lichens p 874
Theca, the cases that contain the sporules of Cryptogamic plants p 874
Threads, long delicate hairs Anacámpseros filamentosa, s 6632
Throat, (120) the orifice of a flower Justícia pícta, s 285
Thyrse, (259) a kind of dense panicle like that of the lilac A'juga turcáta, s 8099
Thyrsoid, resembling a particular kind of panicle called a thyrsus p 85
Tomentose, densely and closely hairy Thymus tomentosus, s 8414
Tomentum, dense close hair Grevillea buxifólia, s 1418
Tonic, bracing, corroborative Salvia, g 62 (note)
Toothed, (260) divided so as to resemble teeth Polýchia, g 21 p 1
Toothletted, furnished with little teeth Sálvia paniculáta, s 402
Topical, local, confined to some particular place Papáver, g 1170 (note)
Torose, uneven, alternately elevated and depressed Papáver hýbridum, s 7659
Tortuous, twisted Helianthemum Fumána, s 7773
Torulose, slightly torose Echites torosa, s 2557
Torus, (258) the same as thalamus, which see Sisýmbrium, g 1422 p 557
Trapeziform, in the shape of a trapezium Boróma serruláta, s 5091
Trapezoid, like a trapezium Adiántum villosum, s 14554
Triandrous, (261) having three stamens p 90
Trichotomous, (102) branches divided in threes Trichodium decumbens, s 1000
Tricuspidate, (262) having three points A'lium Pórrum, s 4617
Trifarious, arranged in triple rank A'loe tortuósa, s 4480
Trifid, divided in three Mantísia, g 16 p 1
Trilocular, (166) having three cells Leptospérmum trilociláre, s 6951
Tripetaloid, appearing as if furnished with three petals Tillandsia xiphioides, s 4144
Tripetalous, having three petals Elatine hydropíper, s 5635
Triquetrous, having three sides or angles A'loe reticuláta, s 4392
Triturated, reduced to powder by pounding, Amýgdalus, g 1128 (note)
Tropical, belonging to the torrid zone Conocárpus, g 544 (note)
Truncate, (263) blunt, as if cut off Hedýchium spicátum, s 34
Tuberculate, covered with knobs or tubercles Ranúnculus parviflórus, s 8073.
Tuberous, (264) bearing solid fleshy roundish roots like the potato Cánna édulis, s 12
Tubers, roots so called Curcuma, g 14 (note)
Tumid, swelling Secále orientále, s 1267
Tunic, a coat Crócus pusíllus s 606
Tunicated, having a coat A'lium Pórrum, s 4617.
Turbinate, (265) having the figure of a top Salvinórma, g 22 p 1
Turgid, swollen, puffed up Brómus praténsis, s 1132

U

Umbellules, (153) divisions of an umbel. Caúcalis daucoides, s 3524
Umbels, (154) the round tuft of flowers produced by the carrot, &c Boerhaávia scándens, s 108
Umbilicus, (266) the cord which attaches the seed to the receptacle Bérberis, g 829 p 239
Umbonate, (267) having a top in the centre like that of the ancient shield Cucúrbita Melopépo, s 13566
Unarmed, destitute of prickles or spines, which are the arms of plants Corispérmum hyssopifolium s 124
Uncinate, (268) hooked Piper adúncum, s 502
Unctuous, fat, oily Anchúsa, g 333 (note)
Undulate, waved Sálvia pomífera, s 370
Undulato-rugose, rugose or rugged and waved Stromatosphæ'ria deústa, s 16361
Unguiculated, furnished with a short unguis. Alpínia galánga, s 40
Unguis, (269) the taper base of a petal Diánthus, p 372 (note)
Unilateral, one-sided Brachypodium lobátum, s 1147
Unilocular, (166) one-celled Calepína, g 1441 (note)
Unisexual, being of one sex Prockia, g 1179 (note)
Urceolate, (270) pitcher-shaped. Camphorósma, g 254 p 78.
Uterine, belonging to the womb Acácia, g 2127 (note)
Uterus, the womb p 981
Utricle, or ***Utriculus,*** a little bottle or bladder. Salvinórma, g 22 p 1
Uvula, the gland of the throat Acácia, g. 2127 (note)

V.

Valvular, (271) or ***Valved,*** consisting of valves or seed cells p 895
Varicose, (272) swollen here and there Pterocárpus, g 1515 p 598
Vascular, (273) consisting of tissue in a very succulent enlarged state Potamogeton, g 317 (note)
Vaulted, (274) formed or placed like the roof of a vault Gladiolus namaquensis, s 709
Veneering, the art of covering one kind of wood with thin plates of another kind Spartium scopárium, p 611 (note)
Ventricose, (275) inflated Gastridium, g 155 p 92
Veratrine, the active principle of Verátrum Veratrum, g 2128 (note)
Vermifuge, that which expels worms Helléborus, g 1237 (note)
Vernacular, native Zingiber, g 10 (note)
Vernal, belonging to the spring Veronica vérna, s 254
Versatile, (276) swinging lightly on a stalk so as to be continually changing direction Sternbergia, g 742 p 237
Vertex, the uppermost point Roméria, g 1108 p 456.
Vertical, perpendicular Nivénia, g 235 p 77
Vertically compressed, that is depressed Salvinórma, g 22 p 1
Verticillaster, the same as rectilinear, in a straight line Viola campestris, s 3037
Vesicatorius, blistering plasters Ranúnculus g 12 3 (note)

Vesicles, (277) hollow excrescences resembling bladders, g 310 (note)
Vexillum, (188) a standard, the upper petal of a papilionaceous flower Petalostémum, g 1501 p 598
Villous, (278) shaggy, with long loose hair Costus villosissimus, s 66
Virescent, green, flourishing Mesembryánthemum viréscens, s 7275
Virgate, twiggy Verbáscum cúpreum, s. 2152.
Viscid, or *Viscous*, adhesive, clammy Boerhaávia viscósa, s 109
Vivacious, lively Cárduus, g 1663 (note)
Viviparous, (279) bearing young plants in the place of flowers and seed Maríca cærúlea, s 841
Vulnerary, useful in the cure of wounds Symphytum, g 334 (note)
Vulsiform, like a cleft with projecting edges Melampódium, g 1828 p 665.

W

Wattled, having processes like the wattles of a cock Rhinánthus alectorolóphus, s 8746
Welted, flaccid, drooping Cárduus acanthoides, s 11375
Whorls, (280) leaves inserted round a stem Hippúris, g 23 (note)
Wing, (281) in botany, signifies a membranous border, wherewith many seeds are supported in the air when floating from place to place Amomum dealbátum, s 77.

Z

Zones, (282) stripes or belts Zonária pavónia, s 15 38

○ signifies wanting or absent. p 79
○ ○, very numerous

TABLE OF SUCH

AS HAVE SYNONYMES IN

In this Index, the systematic names in col 1 are distinguished as classical, i e names memorative, by the terminating letter or letters being in Italic, as Bánks*ia*, and as the other names are formed, in almost every case, from the Greek, but sometimes from

Page		Nos. to Genera.	British or Systematic Synonymes.	English Names.	French	German
650	Abrôma *L*	1609	- - - - -	- - - - -	Ambrome	Die abrome
614	A'brus *L*	1546	- - - -	Wild liquorice	Liane à réglisse	Der abrusstrauch, *or* giftbohne
856	*Acacia Neck*	2127	Mimôsa			
814	*Acálypha L*	2038	- - - - -	Three-seeded Mercury	La ricinelle	Zeckel, *or* brennkraut
516	*Acánthus L*	1301	- - - - -	Bear's breech	Branc-ursine	Die barenklau
864	*Acer L.*	2143	- - - -	Maple	L'érable	Der ahorn
752	*Aceras R Br*	1865	*Ophrys*	Man orchis		
726	*Achillèa* L	1781	- - - - -	Milfoil	L'achilléo	Das achillenkraut
	A Millefolium L sp 12383		- - - - -	Yarrow	Milleteuille	Die schaafgarbe, *or* garbenkraut
150	*Achras L*	427	Nisberry tree	Sapodilla	Le sapotier	Der breyaptelbaum
190	Achyránthes *L*	552	- - - - -	- - - - -	Le cadélari	Die spreublume
834	Acnida *L*	2072	- - - -	Virginian hemp	Acnide de Virginie	Der Virginische hanf
474	*Aconitum Tourn*	1205	- - - - -	Wolf's-bane	L'aconit	Der sturmhut
256	*Acorus L*	755	*Calamus aromaticus*	Sweet rush	L'acore odorant	Der kalmus, *or* calmus
878	Acróstichum *L*	2169	- - - - -	- - - - -	L'acrostique	Der vollblühende farrn
460	*Actæa L*	1164	- - - -	Herb-Christopher	L'actée	Schwarzwurz
204	Actinocárpus *R Br*	860	*Alisma*			
508	*Acynos Pers*	1276	*Thymus*	- - - - -	Basilique sauvage	Kleine bergminze
592	Adansônia L	1471	- - - -	Ethiopian sour gourd, *or* monkey's bread	Le baobab, *or* le pain du singe	Die adansonie, *or* der affenbaum
850	Adèlia *L*	2118	- - -	- - - - -	L'adelie	Quästchen
180	Adenándra *W en*	518	Diósma			
350	Adenanthèra *L*	982	- - - -	Bastard flower fence	Le condori	Der drüsenbeutel
884	Adiántum *L*	2194	- - - -	Maidenhair	Adianthe	Venushaar
98	Adina *Sal*	286	Naúclea			
434	Adónis L	1230	- - - -	Pheasant's eye	Adonide	Die adonisblume, *or* adonisrose
328	Adóxa *L*	930	Musk crowfoot	Moschatel	Moscatelline	Das bisamkrautchen
862	*Ægilops L*	2134	- - - -	Hard grass	L'égilope	Das geissauge
96	Ægiphila *L*	274	- - - -	- - - - -	Ægiphile	Das ziegenbaumchen
468	Ægle Corr	1196	Cratæ*va*	Bengal quince	- - - -	Der schleimapfelbaum
216	Ægopòdium *L*	652	- - - -	Gout weed	Boucage	Geissfuss
762	Aérides *Sw*	1917	- - - -	Air plant	- - - -	- - - -
192	*Æruа* Forsk	560	- - - -	- - - -	Aerve	- - - -
630	Æschynomene *L*	1582	- - - -	Bastard sensitive plant	L'eschynoméne	Die unächte sinnpflanze
296	*Æsculus L*	866	Pàvi*a*	Horsechestnut	Le marronier d'Inde	Die rosskastanie
218	Æthùsa *L*	661	Lesser hemlock	Fool's parsley	Æthuse	Der gartenscherling
260	Agapánthus *Herit*	767	*Crinum africanum*	African lily	Crinole d'Afrique	Die Afrikanische hakenblume
986	*Agáricus L*	2365	- - - -	Mushroom	L'agaric	Der blatterschwamm
